INDUSTRIAL RELATIONS

FINAL REPORT AND TESTIMONY
SUBMITTED TO CONGRESS BY THE
COMMISSION ON INDUSTRIAL RELATIONS

CREATED BY THE ACT OF
AUGUST 23, 1912

VOL. I

WASHINGTON
GOVERNMENT PRINTING OFFICE

1916

AUTHORITY TO PRINT.

[Public Resolution No. 15, Sixty-fourth Congress, first session.]

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the final report of the United States Commission on Industrial Relations, including the report of Basil M. Manly, director of research and investigation, and the individual reports and statements of the several commissioners, together with all the testimony taken at its hearings, except exhibits submitted in printed form, which shall be appropriately referred to in said testimony, be printed as a Senate document under the direction of the Joint Committee on Printing; and that ten thousand additional copies be printed and bound in cloth, of which two thousand five hundred copies shall be for the use of the Senate and seven thousand five hundred copies for the use of the House of Representatives; and that of the final report of said commission one hundred thousand additional copies be printed, of which thirty thousand copies shall be for the use of the Senate and seventy thousand copies for the use of the House of Representatives: *Provided,* That the superintendent of documents is hereby authorized to reprint copies of the same for sale or distribution as provided by law.

Approved, April 28, 1916.

CONTENTS OF VOLUME 1.

	Page.
Final report of commission (see special table of contents, pp. 7-8)-----	5-269
Testimony taken at hearings-----	271-1024
Suggestions of expert witnesses-----	273-398
J. D. Beck, member, Wisconsin Industrial Commission-----	278
C. W. Price, assistant to the Industrial Commission of Wisconsin-----	285
R. W. Campbell, chairman, central safety committee, Illinois Steel Co., Chicago-----	294
W. H. Cameron, secretary, National Council of Safety-----	307
Mrs. Raymond Robbins, president, National Women's Trade-Union, League-----	309
John B. Andrews, secretary, American Association for Labor Legislation-----	319
Herbert Quick, author and farmer-----	320
Charles W. Holman, University of Texas-----	333
John A. Fitch, industrial editor, "The Survey"-----	334
William M. Leiserson, deputy, Industrial Commission of Wisconsin-----	344
F. C. Croxton, president, American Association of Free Public Employment Offices-----	357, 392
Edward T. Devine, Columbia University-----	358
L. A. Halbert, superintendent, Kansas City Board of Public Welfare-----	360, 364
James H. Boyd, ex-chairman, Employers' Liability Commission of Ohio-----	370
Charles McCarthy, Legislative Reference Bureau of Wisconsin-----	377
Meyer Bloomfield, director, Vocational Bureau of Boston-----	390
Trade agreements in collective bargaining-----	399-761
John Mitchell, member, New York State Workingmen's Compensation Commission-----	401
Francis S. Peabody, coal operator-----	428
Frank J. Hayes, international vice president, United Mine Workers of America-----	449
O. P. Briggs, ex-president, National Founders' Association-----	456, 550
Joseph F. Valentine, president, International Molders' Union-----	481
Thomas J. Hogan, secretary Stove Founders' National Defense Association-----	510
John P. Frey, executive officer and editor, International Molders' Union-----	524
Joseph Schaffner, secretary and treasurer, Hart, Schaffner & Marx, Chicago-----	564, 574
Sidney Hillman, president, Cloak and Skirt Makers' Union, New York-----	566
Earl Dean Howard, manager, labor department, Hart, Schaffner & Marx, Chicago-----	571, 592
Julius Henry Cohen, counsel, Cloak, Suit, and Skirt Manufacturers' Protective Association-----	575, 587
A. Bisno, chairman, educational committee, Cloak Makers' Union, New York-----	579
James M. Lynch, commissioner of labor, State of New York-----	594
Albert W. Finlay, chairman, executive committee, United Typothetæ of America-----	609
George L. Berry, president, International Printing Pressmen and Assistants' Union-----	620
Otto M. Eidlitz, general contractor, New York-----	644

Testimony taken at hearings—Continued.

Trade agreements in collective bargaining—Continued.

FINAL REPORT OF THE COMMISSION ON INDUSTRIAL RELATIONS

INCLUDING THE
REPORT OF BASIL M. MANLY, DIRECTOR
OF RESEARCH AND INVESTIGATION
AND THE
INDIVIDUAL REPORTS AND STATEMENTS
OF THE SEVERAL COMMISSIONERS

THE COMMISSION ON INDUSTRIAL RELATIONS.

FRANK P. WALSH, Missouri, *Chairman.*

JOHN R. COMMONS, Wisconsin.

S. THRUSTON BALLARD, Kentucky.

FLORENCE J. HARRIMAN, New York.

JOHN B. LENNON, Illinois.

RICHARD H. AISHTON, Illinois.¹

JAMES O'CONNELL, District of Columbia.

HARRIS WEINSTOCK, California.

AUSTIN B. GARRETSON, Iowa.

LEWIS K. BROWN, *Secretary.*

WILLIAM O. THOMPSON, *Counsel.*

BASIL M. MANLY, *Director of Research and Investigation.*

EXTRACT FROM ACT OF CONGRESS OF AUGUST 23, 1912, CREATING AND DEFINING
THE DUTIES OF THE COMMISSION ON INDUSTRIAL RELATIONS.

That a commission is hereby created to be called the Commission on Industrial Relations. Said commission shall be composed of nine persons, to be appointed by the President of the United States, by and with the advice and consent of the Senate, not less than three of whom shall be employers of labor and not less than three of whom shall be representatives of organized labor.

* * * * *

SEC. 4. That the commission shall inquire into the general condition of labor in the principal industries of the United States, including agriculture, and especially in those which are carried on in corporate forms; into existing relations between employers and employees; into the effect of industrial conditions on public welfare and into the rights and powers of the community to deal therewith; into the conditions of sanitation and safety of employees and the provisions for protecting the life, limb, and health of the employees; into the growth of associations of employers and of wage earners and the effect of such associations upon the relations between employers and employees; into the extent and results of methods of collective bargaining; into any methods which have been tried in any State or in foreign countries for maintaining mutually satisfactory relations between employees and employers; into methods for avoiding or adjusting labor disputes through peaceful and conciliatory mediation and negotiations; into the scope, methods, and resources of existing bureaus of labor and into possible ways of increasing their usefulness; into the question of smuggling or other illegal entry of Asiatics into the United States or its insular possessions, and of the methods by which such Asiatics have gained and are gaining such admission, and shall report to Congress as speedily as possible, with such recommendation as said commission may think proper to prevent such smuggling and illegal entry. The commission shall seek to discover the underlying causes of dissatisfaction in the industrial situation and report its conclusions thereon.

¹ Appointed commissioner Mar. 17, 1915, to serve the unexpired term of Hon. F. A. Delano, resigned.

LETTER OF TRANSMITTAL.

COMMISSION ON INDUSTRIAL RELATIONS,
Chicago, Ill., August 23, 1915.

To the Sixty-fourth Congress:

On behalf of the Commission on Industrial Relations, I have the honor to transmit herewith its final report.

The assembling of facts in the report of the staff from the records of our public hearings and the reports of investigators, under the direction of Mr. Basil M. Manly, might well be taken, in my opinion, as a model of efficiency and scientific treatment by governmental departments.

The plan of submitting none but undisputed facts in the final report of the commission has been faithfully adhered to.

No statement or conclusion of fact adverse to the attitude or interest of any person or group of persons is submitted, except as declared or assented to by the person or by the individuals comprising the group affected. Thus, for perhaps the first time in the history of our Government, the facts in relation to conditions in the industries examined and the relations inquired into are placed beyond the realm of controversy and established upon the solid and scientific basis of ascertained and indisputable fact.

It is believed that the work of the commission has been conducted in a spirit of social justice and an earnest desire to serve the public by bringing into the light the facts regarding the industrial relations of the country. For the creation of this spirit, as well as for an earnest insistence that the education of the public should be the keynote, I feel that full credit should be accorded Mr. George P. West, and that in addition thereto he should be credited with the inspiration and planning of many of the most effective public hearings of the commission.

Respectfully,

FRANK P. WALSH, *Chairman.*

I.

Report of Basil M. Manly

Director of Research and Investigation

**Embodying the Findings of Fact, Conclusions, and Recommendations
of the Staff, based upon their Investigations and the
Testimony of Public Hearings**

SIGNED BY

Commissioners Walsh, Lennon, O'Connell, and Garretson

TOGETHER WITH

**Supplemental Statements by Chairman Walsh, Commission-
ers Garretson, Lennon, and O'Connell**

LETTER OF SUBMITTAL.

CHICAGO, ILL., *August 9, 1915.*

To the COMMISSION ON INDUSTRIAL RELATIONS:

I have the honor to submit herewith my report, which has been prepared by direction of the commission as a summary and interpretation of the evidence contained in the public hearings of the commission and the reports of the staff, together with suggestions for action designed to remedy such evils and abuses as have been developed by investigation.

In the preparation of this report I have directed my attention primarily to the most important question placed before the commission by Congress, namely, "the underlying causes of dissatisfaction in the industrial situation." I have, however, attempted to cover as adequately as possible all the questions embodied in section 4 of the act.

A few words with regard to the method of preparation may be of value: The policy of the commission in intrusting certain important subjects to the members of the staff for investigation under the general supervision of the director has been continued throughout. The members of the staff who had charge of definite subjects have made their final reports embodying the results of their investigations and the pertinent parts of the testimony before the commission. These reports have, as far as possible, been accepted as the basis for the statements and recommendations contained in this report. It is only fair, however, to state that in certain respects they have been modified, largely as a result of the discussion which took place when these reports were presented to the commission in tentative form. Nevertheless, in every case the substance and essential ideas of each investigator's report have been retained.

The enormous mass of testimony heard by the commission has been drawn upon freely. In using this testimony I have been guided by the principle of quoting only statements made by the party to whom such evidence would be unfavorable or by persons who were clearly nonpartisan. For example, in the criticism of the attitude and actions of employers only the testimony given by employers or their agents has been quoted; the testimony of labor representatives being used only to show the attitude of the workers.

In addition, I have utilized to a very large extent the reports of other governmental agencies, not only as sources of original information but as a check upon the statements and conclusions contained herein. In relation to a few subjects, indeed, the information already collected made it unnecessary for the commission to conduct investigations of its own.

This report should properly be known as the report of the staff, except that, as noted above, I feel it necessary to assume personal responsibility for certain modifications which have been made from the original reports. I wish to state, however, that I have drawn most largely upon the following reports, which are submitted herewith, with the suggestion that Congress be requested to print them as supplements to this report:¹

- W. JETT LAUCK:
Analysis of Economic Causes of Unrest.
- EDGAR SYDENSTRICKER:
Labor Conditions in American Industry.
- CHRISTOPHER T. CHENERY:
The Telephone and Telegraph Industry.
Labor Conditions in Porto Rico.
- MARIE L. OBENAUER:
Women in Industry.
Interstate Competition.
- GERTRUDE BARNUM:
Enforcement of Laws Regulating Working Hours of Women in Wisconsin.
- GEORGE P. WEST:
Labor Conditions in Colorado.
- WILLIAM P. HARVEY:
Labor Conditions in the Black Hills.
Labor Conditions in Los Angeles.
- CHARLES W. HOLMAN:
Preliminary Report on the Land Question.
- JOHN L. COULTER:
Agricultural Labor and Tenancy.
- WILLIAM M. LEISERSON:
Unemployment.
- PETER A. SPEEK:
Conditions in Labor Camps.
Labor Complaints and Claims.
Migratory Workers.
- GEORGE E. BARNETT:
Joint Agreements.
- GEORGE E. BARNETT and D. A. McCABE:
Mediation and Arbitration.
- LEO WOLMAN:
Extent and Growth of Labor Organizations.
- J. WALLACE BRYAN:
Trade-Union Law.
- EDWIN E. WITTE:
Injunctions in Labor Disputes.
- ROBERT F. HOXIE:
Scientific Management and Labor.
- B. S. WARREN:
Industrial Conditions and the Public Health.
- LUKE GRANT:
Violence in Labor Disputes and the Policing of Industry.
The National Erectors' Association and the International Association of Bridge and Structural Iron Workers.
- REDMOND S. BRENNAN and PATRICK F. GILL:
The Inferior Courts and Police of Paterson, N. J.
- EDWARD A. FITZPATRICK:
Chinese Exclusion.

In addition to those named above, the following members of the staff, who have performed exceptional service and whose reports have to some extent been used directly, should be mentioned: Henry Winthrop Ballantine, Charles B. Barnes, Francis H. Bird, E. H.

¹ These reports have not been printed with this document, on the recommendation of Chairman Frank P. Walsh, as stated in his letter in Senate Report No. 143, Sixty-fourth Congress. The reports on Labor Conditions in Colorado and the National Erectors' Association were printed by the commission itself in 1915.

Busiek, W. J. Coyne, Nelle B. Curry, Alexander M. Daly, F. S. Deibler, Noel T. Dowling, H. E. Hoagland, Carl Hookstadt, B. F. Moore, Daniel T. O'Regan, M. O'Sullivan, Selig Perlman, Sumner Slichter, George L. Sprague, and Inis Weed.

Special mention should be made also of Charles J. Stowell and Elizabeth A. Hyde, whose work in research and in the digesting of testimony has been invaluable.

- The success of the public hearings was due in large measure to the courage, tact, and good humor of Thomas J. Egan, who performed the difficult duties of sergeant at arms for the commission.

I wish to express my appreciation of the generous cooperation of the secretary, Mr. Lewis K. Brown, upon whose executive ability and tactful administration of the commission's affairs the work of the staff in large measure depended. I wish also to express to the commission my acknowledgment and appreciation of the unusual freedom which has been accorded me in the administration of the work of research and investigation, and in the conduct of the public hearings.

Respectfully,

BASIL M. MANLY, *Director.*

FINAL REPORT OF THE COMMISSION ON INDUSTRIAL RELATIONS.

REPORT OF BASIL M. MANLY, DIRECTOR OF RESEARCH AND
INVESTIGATION.

INTRODUCTION.

The question of industrial relations assigned by Congress to the commission for investigation is more fundamental and of greater importance to the welfare of the Nation than any other question except the form of our government. The only hope for the solution of the tremendous problems created by industrial relationship lies in the effective use of our democratic institutions and in the rapid extension of the principles of democracy to industry.

The immediate effects of the form and character of industrial organization are, however, greater and closer to the lives and happiness of all classes of citizens than even the form and character of our political institutions. The ordinary man, whether employer or worker, has relatively little contact with the Government. If he and his family are well fed, well housed, and well clothed, and if he can pay for the education of his children, he can exist even under an autocratic monarchy with little concern, until some critical situation develops in which his own liberty is interfered with or until he is deprived of life or property by the overwhelming power of his tyrannical ruler. But his industrial relations determine every day what he and his family shall eat, what they shall wear, how many hours of his life he shall labor and in what surroundings. Under certain conditions where his individual or corporate employer owns or controls the community in which he lives, the education of his children, the character and prices of his food, clothing, and house, his own actions, speech, and opinions, and in some cases even his religion, are controlled and determined, in so far as the interests of the employer make it desirable for him to exercise such control. Such conditions are established and maintained not only through the dictation of all working conditions by the employer, but by his usurpation or control of the functions and machinery of political government in such communities.

In the available time it has been impossible to ascertain how general such conditions are, but it is clearly indicated by the investigations that in isolated industrial, mining, or agricultural communities, which are owned or controlled by single individuals or corporations, and in which the employees are unorganized, industrial feudalism is the rule rather than the exception.

In such communities democratic government does not, as a rule, exist, except in name or form, and as a consequence there now exist within the body of our Republic industrial communities which are virtually principalities, oppressive to those dependent upon them for a livelihood and a dreadful menace to the peace and welfare of the Nation.

Such conditions as these are the direct and inevitable consequence of the industrial relations which exist in such communities. Political freedom can exist only where there is industrial freedom; political democracy only where there is industrial democracy.

Such industrial democracy has been established in a greater or less degree in certain American industries or for certain classes of employees. But between conditions of industrial democracy and industrial feudalism there are almost infinite gradations marking the stages of evolution which have been reached. In every case, however, investigation has shown that the degree of political freedom and democracy which exists is conditioned by the industrial status of the citizens who form the majority of the community.

The problems of industrial relations, therefore, demand the attention of Congress, not only because they determine the life, security, and happiness of the 25,000,000 citizens of the United States who occupy the position of wage earners but because they affect for good or evil the government of localities and States and to a smaller degree that of the Nation itself. What each of these wage earners shall eat, what he shall wear, where he shall live, and how long and under what conditions he shall labor are determined by his industrial status and by his relation, individually or collectively, to the person or corporation employing him. Similarly and almost as directly, this relationship determines whether the machinery of government shall be used for or against his welfare; whether his vote shall count for or against his own interest; whether he shall be tried by a jury of his peers or a jury selected in collusion with the employing company, or, under conditions of so-called martial law, by no jury whatever; whether, in fact, he shall be a free man or be deprived of every right guaranteed by Federal and State constitutions, imprisoned without warrant for the commission of crimes of which he may be innocent or forcibly deported from the community or State in which he has made his home. For these reasons it seems desirable at the outset to suggest a recommendation to Congress that these problems of industrial relationship should occupy their due prominence in the deliberations of that honorable body, and that the entire machinery of the Federal Government should be utilized to the greatest possible degree for the correction of such deplorable conditions as have been found to exist.

The lack of a proper industrial relationship and the existence of bad labor conditions is a matter of the most serious moment during times of peace, but the events of the past year have demonstrated how enormously their menace to the welfare of a nation is increased during a period of war. The present European war is being fought on the farms and in the factories as much as in the trenches. The effective mobilization of our industrial resources is as important, simply from the standpoint of war, as is the mobilization of our military and naval forces.

It is equally important that action should be taken now, and not after war is a reality.

An attempt has been made in the succeeding pages of this report to suggest some of the measures which should be adopted, with a full realization, however, that no action will be effective which does not come through an understanding by the American people of the essential facts regarding industrial conditions. Practically there are only two alternatives for effective action: First, the creation of a huge system of bureaucratic paternalism such as has been developed in Germany; second, action which removes the many existing obstacles which prevent effective organization and cooperation, reserving for performance by the Government only those services which can not be effectively conducted by voluntary organizations and those which are of such vital importance to the entire Nation that they should not be left to the hazard of private enterprise.

In closing this introductory statement it is proper to append a quotation from Carlyle, the great Scotch historian, which contains in a few eloquent sentences the very heart of the situation in American industry:

With the working people, again, it is not so well. Unlucky! For there are from twenty to twenty-five millions of them. Whom, however, we lump together into a kind of dim compendious unity, * * *, as "the masses." Masses indeed; and yet, singular to say, the masses consist of units, * * *, every unit of whom has his own heart and sorrows; stands covered there with his own skin, and if you prick him he will bleed. Every unit of these masses is a miraculous man, even as thou thyself art; struggling with vision or with blindness for his infinite kingdom (this life which he has got once only in the middle of eternities); with a spark of the divinity, what thou callest an immortal soul, in him!

Clearly a difficult "point" for government, that of dealing with these masses; if indeed it be not rather the sole point and problem of government, and all other points mere accidental crotchets, superficialities, and beatings of the wind! For let charter chests, use and wont, law common and special, say what they will, the masses count to so many millions of units, made, to all appearance, by God, whose earth this is declared to be.

METHOD AND CHARACTER OF INVESTIGATION.

In the investigation of questions so intimately affecting the lives of a large part of the American people the ordinary methods of compiling facts and drawing deductions would have been utterly insufficient, not only because the ground to be covered was too extensive, but because the situation was too largely the result of the opinions, beliefs, and convictions of employers and employees to be susceptible of ascertainment by such a method. Furthermore, it became clear very early in the investigation that the problems which were presented could be solved only by the will and conscience of the American people acting either directly or through their representatives in the State and Federal Governments.

The commission has therefore called before it witnesses representing persons drawn from almost every walk of life, whose knowledge and opinions were believed to be of value. In order that the information developed by these hearings should reach the people they were not only held in public, but, through the newspapers, the facts developed by them have been carried throughout the Nation.

These hearings have occupied in all 154 days, or rather more than the equivalent of 6 months of the commission's time. One or more

hearings were held in each of the following cities: Washington, New York, Paterson, Philadelphia, Boston, Chicago, Lead (S. Dak.), Butte, Seattle, Portland, San Francisco, Los Angeles, Denver, and Dallas. The witnesses, however, were by no means limited to these localities, but in every case the best-informed persons were brought to the centers at which the hearings were held.

The representative character of the witnesses may best be shown by the statement on the following page.

Classification of witnesses upon industrial subjects.

Affiliated with employers :	
Employers, managers, foremen, etc	134
Representatives of employers' organizations.....	37
Attorneys.....	15
Efficiency engineers.....	10
Employment agents.....	14
Capitalists, bankers, directors, etc	20
	230
Affiliated with labor :	
Trades-union officials	135
Workingmen and working women	90
Attorneys.....	6
Industrial Workers of the World.....	8
Representatives of the Socialist Party.....	6
	245
Not affiliated with either group :	
Agriculturists	22
Attorneys.....	15
Public officials.....	69
Representatives of civic organizations.....	24
Educators.....	22
Economists and sociologists	20
Investigators.....	11
Representatives of the press.....	14
Clergy.....	10
Physicians	7
Unclassified.....	17
On Chinese exclusion	34
	265
Total	740

These witnesses were not arbitrarily selected by the commission, but were chosen only after careful investigation by agents of the commission, who consulted the persons best informed regarding the industry, locality, or question under consideration. Every opportunity was given employers and employees to suggest the names of witnesses who could best present their side of the case, and the persons thus suggested were without exception heard with absolute freedom not only as regards time, but without regard to the technical rules of evidence.

It seems desirable also to call attention to the fact that in this report, except for citations from admittedly nonpartisan official bodies, there are no statements of fact affecting any person or group of persons which have not been submitted to the parties directly concerned, or which have not been quoted from documents submitted by them or from their public testimony. The submission of the facts developed by preliminary investigation to the parties affected for verification or correction at public hearings is believed to be the best means of ascertaining the truth and avoiding evasion. The same is

true of the recommendations and conclusions contained in the report, a very large number of which were submitted for criticism at public hearings or by correspondence.

SUMMARY OF CONCLUSIONS AND RECOMMENDATIONS.

In the act of Congress creating the commission, section 4 named 11 questions into which inquiry was specifically directed. Of these questions three, relating to industrial conditions, industrial relations, and the causes of industrial unrest, were fundamental in character and of broad scope, while eight were specific and dealt more largely with matters of detail. Leaving these eight specific questions for detailed consideration in the body of the report, it seems desirable to present briefly at this point the findings and conclusions with regard to these general questions.

LABOR CONDITIONS IN THE PRINCIPAL INDUSTRIES, INCLUDING AGRICULTURE.

In considering the conditions of labor in American industries, it has seemed that they could be judged or appraised only by comparing conditions as they actually exist with what knowledge and experience shows that they might easily be made during the immediate future if proper action were taken to utilize the resources of our Nation efficiently and distribute the products equitably.

As against this view there has been an attempt by some persons to urge the judgment of all things by comparison with the past. Much stress has been laid by certain witnesses upon the alleged improvement of the condition of the workers during the past quarter century.

This point, however, is regarded as generally immaterial. The crux of the question rather is, Have the workers received a fair share of the enormous increase in wealth which has taken place in this country, during the period, as a result largely of their labors? The answer is emphatically, No!

The wealth of the country between 1890 and 1912 increased from sixty-five to one hundred and eighty-seven billions, or 188 per cent, whereas the aggregate income of wage earners in manufacturing, mining, and transportation has risen between 1889 and 1909 only 95 per cent, from two thousand five hundred and sixteen millions in 1889 to four thousand nine hundred and sixteen millions in 1909. Furthermore, the wage earners' share of the net product¹ of industry in the case of manufactures was only 40.2 per cent in 1909, as compared with 44.9 per cent in 1889.

Similarly, the attempt to dismiss deplorable labor conditions in the United States by arguments that they are better than in European countries is repugnant. To say that conditions are better than in Great Britain, for example, is simply to say that somewhat less than one-third of the population is in a state of absolute poverty, for that was the condition reported by the latest British commission. It should be a matter of shame also to boast that the condition of

¹ The net product is the value that remains after subtracting the cost of materials from the total value.

American laborers is better than that of laborers in the "black bread belt" of Germany.

That conditions are, as a matter of fact, but little better is proved conclusively by the almost complete cessation of immigration from Germany, England, and France. No better proof of the miserable condition of the mass of American workers need be sought than the fact that in recent years laborers in large numbers have come to this country only from Russia, Italy, Austria-Hungary, and the backward and impoverished nations of southern and eastern Europe.

With the inexhaustible natural resources of the United States, her tremendous mechanical achievements, and the genius of her people for organization and industry, there can be no natural reason to prevent every able-bodied man of our present population from being well fed, well housed, comfortably clothed, and from rearing a family of moderate size in comfort, health, and security. How far this ideal is actually achieved is discussed in some detail in the following pages.

It is evident both from the investigations of this commission and from the reports of all recent governmental bodies that a large part of our industrial population are, as a result of the combination of low wages and unemployment, living in a condition of actual poverty. How large this proportion is can not be exactly determined, but it is certain that at least one-third and possibly one-half of the families of wage earners employed in manufacturing and mining earn in the course of the year less than enough to support them in anything like a comfortable and decent condition. The detailed evidence is presented in a separate report which is submitted for transmittal to Congress.¹ At this point it is sufficient to call attention to the results of the most exhaustive and sweeping official investigation of recent years, that of the Immigration Commission, which reported to Congress in 1909. This investigation secured detailed information regarding the daily or weekly earnings of 619,595 employees of all classes in our basic manufacturing industries and in coal mining, and information regarding income and living conditions for 15,726 families.

It was found that the incomes of almost two-thirds of these families (64 per cent) were less than \$750 per year and of almost one-third (31 per cent) were less than \$500, the average for all being \$721. The average size of these families was 5.6 members. Elaborate studies of the cost of living made in all parts of the country at the same time have shown that the very least that a family of five persons can live upon in anything approaching decency is \$700. It is probable that, owing to the fact that the families investigated by the Immigration Commission were, to a large extent, foreign born, the incomes reported are lower than the average for the entire working population; nevertheless, even when every allowance is made for that fact, the figures show conclusively that between one-half and two-thirds of these families were living below the standards of decent subsistence, while about one-third were living in a state which can be described only as abject poverty.

American society was founded and for a long period existed upon the theory that the family should derive its support from the earn-

¹ Report of Edgar Sydenstricker: Labor Conditions in American Industries.

ings of the father. How far we have departed from this condition is shown by the fact that 79 per cent of the fathers of these families earned less than \$700 per year. In brief, only one-fourth of these fathers could have supported their families on the barest subsistence level without the earnings of other members of the family or income from outside sources.

Other facts collected in this investigation show conclusively that a very large proportion of these families did not live in decency and comfort. Thirty per cent kept boarders and lodgers, a condition repugnant to every ideal of American family life, especially in the crowded tenements or tiny cottages in which the wage earners of America characteristically live. Furthermore, in 77 per cent of the families two or more persons occupied each sleeping room, in 37 per cent three or more persons, and in 15 per cent four or more persons.

The most striking evidence of poverty is the proportion of pauper burials. The repugnance of all classes of wage earners of all races to pauper burial is such that everything will be sacrificed and heavy debts incurred rather than permit any member of the family to lie in the "potter's field"; nevertheless in New York City 1 out of every 12 corpses is buried at the expense of the city or turned over to physicians for dissection.¹

The terrible effects of such poverty may be outlined in a few paragraphs, but their far-reaching consequences could not be adequately shown in a volume.

Children are the basis of the State; as they live or die, as they thrive or are ill nourished, as they are intelligent or ignorant, so fares the State. How do the children of American workers fare?

It has been proved by studies here and abroad that there is a direct relation between poverty and the death rate of babies; but the frightful rate at which poverty kills was not known, at least for this country, until very recently, when through a study made in Johnstown, Pa., by the Federal Children's Bureau, it was shown that the babies whose fathers earned less than \$10 per week died during the first year at the appalling rate of 256 per 1,000. On the other hand, those whose fathers earned \$25 per week or more died at the rate of only 84 per 1,000. The babies of the poor died at three times the rate of those who were in fairly well-to-do families. The tremendous significance of these figures will be appreciated when it is known that one-third of all the adult workmen reported by the Immigration Commission earned less than \$10 per week, even exclusive of time lost. On the showing of Johnstown these workmen may expect one out of four of their babies to die during the first year of life.

The last of the family to go hungry are the children, yet statistics show that in six of our largest cities from 12 to 20 per cent of the children are noticeably underfed and ill nourished.

The minimum amount of education which any child should receive is certainly the grammar school course, yet statistics show that only one-third of the children in our public schools complete the grammar school course, and less than 10 per cent finish high school.² Those

¹ Statistics for New York are the only ones available which are reasonably complete. Even there not all are included who die in a state of extreme poverty, as it is well known that national societies and sympathetic individuals claim a large number of bodies of persons absolutely unknown to them.

² Elimination of Pupils from School. Edward L. Thorndike. Bull. 379, U. S. Bureau of Education.

who leave are almost entirely the children of the workers, who, as soon as they reach working age, are thrown, immature, ill trained, and with no practical knowledge, into the complexities of industrial life. In each of four industrial towns studied by the Bureau of Labor Statistics, more than 75 per cent of the children quit school before reaching the seventh grade.¹

The great seriousness of this condition is even more acutely realized when it is known that in the families of the workers 37 per cent of the mothers are at work² and consequently unable to give the children more than scant attention. Of these mothers 30 per cent keep boarders and lodgers and 7 per cent work outside the home.

As a final statement of the far-reaching effects of the economic condition of American wage earners, it seems proper to quote the following statement of the Chicago Commission on Crime, which after thorough investigation, has reported during the past year:

The pressure of economic conditions has an enormous influence in producing certain types of crime. Insanitary housing and working conditions, unemployment, wages inadequate to maintain a human standard of living, inevitably produce the crushed or distorted bodies and minds from which the army of crime is recruited. The crime problem is not merely a question of police and courts; it leads to the broader problems of public sanitation, education, home care, a living wage, and industrial democracy.³

The other factors in the conditions under which labor is employed in American industry, such as working hours, regularity of employment, safety, and sanitation, are left for later discussion. Suffice it to say in this connection that while in certain fields great improvements have been made, the general situation is such that they accentuate rather than relieve the deplorable effects of inadequate income which have been pointed out.

As a picture of American industry, this presentation is undeniably gloomy and depressing, but as a diagnosis of what is wrong with American labor conditions, it is true and exact. There are, of course, many bright spots in American industry, where workmen are well paid and regularly employed under good working conditions in the determination of which they have some share. But, even as the physician pays little attention to the good eyes and sound teeth of a patient whose vital organs are diseased, so impressive is the urgent need for attention to the diseased spots in industry, it is felt to be unnecessary to waste time in word pictures of conditions which are all right or which may be depended upon to right themselves.

In agriculture there is no array of exact figures which can be quoted to show the condition of labor. But, speaking generally, the available evidence indicates clearly that while in some sections agricultural laborers are well paid and fairly treated, the condition of the mass is very much like that of the industrial workers.

Moreover, there is a peculiar condition in agriculture which merits a brief but strong statement at this point as a preface to a more detailed discussion later. The most alarming fact in American agriculture is the rapid growth of tenancy. In 1910 there were 37 tenant-

operated farms in each 100 farms in the United States, as compared with 28 in 1890, an increase of 32 per cent during 20 years. No nation-wide investigation of the condition of tenant farmers has ever been made, but in Texas, where the investigations of this commission were thorough and conclusive, it was found not only that the economic condition of the tenant was extremely bad but that he was far from being free, while his future was regarded as hopeless. Badly housed, ill nourished, uneducated, and hopeless, these tenants continue year after year to eke out a bare living, moving frequently from one farm to another in the hope that something will turn up. Without a large family the tenant can not hope to succeed or break even, so in each tenant family numerous children are being reared to a future which under present conditions will be no better than that of their parents, if as good: The wife of a typical tenant farmer, the mother of 11 children, stated in her testimony before the commission that in addition to the rearing of children, making their clothes, and doing the work of the house, she always helped with the crops, working up to within three or four months before children were born, and that during all the years of her married life she had had no ready-made dresses and only three hats. The investigations of this commission in that rich and generally prosperous section of the country only confirm and accentuate the statements of the Federal Industrial Commission which reported in 1902:

The result of this system [share tenancy] is that the renters rarely if ever succeed in laying by a surplus. On the contrary, their experiences are so discouraging that they seldom remain on the same farm for more than a year. They are not only unable to lay by any money, but their children remain uneducated and half clothed. The system is apparently one of the most undesirable, so far as its effect on the community is concerned.¹

Similarly, the Public Lands Commission reported in 1905:

There exists and is spreading in the West a tenant or hired labor system which not only represents a relatively low industrial development, but whose further development carries with it a most serious threat. Politically, socially, and economically this system is indefensible.

The condition of agricultural laborers can not, however, be dismissed without referring to the development of huge estates which are operated by managers with hired labor on what may properly be called a "factory system." The conditions upon such estates are deplorable, not only because of the extremely low wages paid (80 cents per day in the case of one which was carefully investigated), but even more because these estates, embracing within their boundaries entire counties and towns, are a law unto themselves and the absolute dictators of the lives, liberties, and happiness of their employees. It is industrial feudalism in an extreme form. Such estates are, as a rule, the property of absentee landlords, who are for the most part millionaires, resident in the eastern States or in Europe.

EXISTING RELATIONS BETWEEN EMPLOYERS AND EMPLOYEES.

Considering the whole field of American industry, there are almost infinite variations of relationship between employers and employees, ranging from the individual worker hired by a single employer, as

¹ Reports of the Industrial Commission, Vol. XIX, 1902, p. 98.

in domestic service and agriculture, to the huge corporation with a hundred thousand stockholders and a quarter of a million employees. Relationship varies from that of direct contact to a situation where the employee, together with thousands of his fellow workers, is separated by hundreds of miles from the individuals who finally control his employment and of whose existence he is usually entirely ignorant.

A thorough discussion of the relationships which exist under these various forms of industrial organization would be not only tedious, but useless for all practical purposes. The typical form of industrial organization is the corporation. In transportation approximately 100 per cent of the wage earners are employed by corporations; in mining, 90 per cent; and in manufacturing, 75 per cent. Moreover, it is under this form that the great problems of industrial relations have developed.

The actual relationship which exists between employers and employees under the artificial conditions which characterize the corporate form of organization can not be understood without an analysis of the powers, functions, and responsibilities of the different elements which go to make up the typical corporation. The actual ownership of a corporation is vested in the stockholders and bondholders, whose only interest in the industry is represented by certificates upon the basis of which they expect the payment of interest or dividends at stated intervals.

The control of the property, as far as operation is concerned, rests finally with the stockholders, or with some particular class of stockholders whose shares entitle them to vote. The stockholders, however, act through the board of directors, who are usually elected in such a way that they represent only the dominant interest.¹ As far as the organization of the corporation is concerned, the principal function of the board of directors is to select the executive officials. These executive officials, either directly or indirectly, select the numerous superintendents, foremen, and petty bosses by whom the direct operation of the enterprise is managed and through whom all the workers are hired, discharged, and disciplined.

This is a skeleton of corporate organization. To understand its operations it is necessary to examine the functions and responsibilities of the different parts of the organization.

Theoretically and legally, the final control and responsibility rests with the stockholders, but in actual practice a very different situation is found. The relationship of stockholders to a corporation is anything but permanent; in a busy week on Wall Street the number of shares bought and sold in one of the great corporations will greatly exceed the total number of shares that are in existence. The stockholders as a class, therefore, have no guiding interests in the permanent efficiency of the corporation as regards either the preservation of its physical property or the maintenance of an efficient productive organization. Stocks are bought either as a speculation or as an investment, and in case either the physical property deteriorates or the productive organization tends to become inefficient, the well-informed stockholder generally takes no steps to correct the

¹ See the testimony of Mr. Jacob H. Schiff, Mr. Samuel Untermyer, and others upon this point.

condition, but merely throws his stock upon the market. This marks a very real and definite distinction from the actual ownership of a property or business which must be kept in good condition by its owner as regards both plant and organization. If all industries were owned and operated by individuals, there might be some reason to hope that generally satisfactory wages and physical conditions might be attained through the education of the owner to a realization that permanent success depended absolutely upon the maintenance of the plant in the best condition and the permanent satisfaction of the legitimate demands of the workers, but with the impersonal, remote, and irresponsible status of control by stock ownership, such a hope must be purely illusory. The ordinary stockholder in a large corporation actually occupies a less direct relationship to the corporation in which he is interested, has less knowledge of its actual operations, and less control over its management than the ordinary citizen has over local, State, and National Governments.

Boards of directors in theory are responsible for and would naturally be expected to maintain supervision over every phase of the corporation's management, but, as a matter of fact, we know that such supervision is maintained only over the financial phase of the business, controlling the acquisition of money to operate the business and distributing the profits. Actual direction generally exists only through the removal of executive officials who fail to deliver the expected profits, and through the appointment of their successors.¹

Upon the testimony of financiers representing, as directors, hundreds of corporations, the typical director of large corporations is not only totally ignorant of the actual operations of such corporations, whose properties he seldom, if ever, visits, but feels and exercises no responsibility for anything beyond the financial condition and the selection of executive officials. Upon their own statements, these directors know nothing and care nothing about the quality of the product, the condition and treatment of the workers from whose labor they derive their income, nor the general management of the business.²

As far as operation and actual management are concerned, the executive officials are practically supreme. Upon their orders production is increased or decreased, plants are operated or shut down, and upon their recommendations wages are raised or lowered. But even they have little direct contact with the actual establishment of working conditions, and no relation at all with the rank and file of the workers. They act upon the recommendations of superintendents, whose information comes from their assistants and foremen, and from the elaborate statistics of modern business, which account for every penny that comes and goes, but ignore as though they did not exist the men and women whose labor drives the whole mechanism of business.

Here, then, is the field of industrial relations: Masses of workers on the one side dealing in some manner with foremen and superintendents on the other, behind whom is an organization of execu-

¹ See especially the testimony of Messrs. J. P. Morgan, John D. Rockefeller, jr., and August Belmont upon this point.

² See the testimony of Messrs. Jacob H. Schiff, Daniel Guggenheim, Roger W. Babson, and John D. Rockefeller, jr.

tive officials, representing in turn the board of directors, who are the chosen representatives of the stockholders.

The crux of the whole question of industrial relations is: Shall the workers for the protection of their interests be organized and represented collectively by their chosen delegates, even as the stockholders are represented by their directors and by the various grades of executive officials and bosses?

In considering this issue the first question that presents itself is, Why should such representation be demanded as a necessity? Not only are the executive officials, superintendents and bosses, some witnesses have urged before the commission, for the most part humane and well-intentioned men, but they know that the interests of the business depend upon the welfare of the workers and, if unhindered, will pay the best wages and create the best working conditions that the business can afford. Organization and representation are therefore argued to be unnecessary and tending only to promote friction and interfere with the management of the business.

Let us grant the high character and good intentions of officials and consider the statement of the workers in reply.

They say that in modern corporate business the actions of officials are governed not by their personal intentions, but by the inexorable demands for interest and dividends, and are driven not by their desire to create a permanently successful business with a contented labor force, but by the never-relaxed spur of the comparative cost sheet. The constant demand is for high production at low cost, not through improvements and good conditions which might give them next year, but this very month. In the high pressure of business every superintendent knows that if his plant is at the bottom of the comparative scale for two months his position topples, and if for three months it is virtually gone. He can not afford to experiment with changes that will not give immediate results. If he were his own master he might take a chance, knowing that the loss of this year would be compensated by gains under better conditions next year, but the monthly cost sheet does not wait for next year; it demands results now.

But it may be said that if he can not improve conditions himself he can at least recommend them to his superiors, to be transmitted to the board of directors for approval. This might indeed be done, and with the extension of an understanding among managers that low-production costs may be secured with high wages, probably would be to an increasing extent, except that boards of directors scorn such abstractions as the high-wage-low-cost theory and habitually insist that managers shall buy labor, as they buy material, in the cheapest market. Moreover, raising wages is traditionally unpopular among stockholders and directors, and recommendations for better conditions, particularly if they involve new capital, are frowned upon.¹ Neither the stockholders nor the directors have to live on wages or work in the existing surroundings, and profits deferred are considered profits lost.

The workers, therefore, deny the potency of even good intentions on the part of managers and point to labor history, which they

¹ See the discussion in the 1915 stockholders' meeting of the United States Steel Corporation which was devoted almost exclusively to the question whether the corporation, at an expense of a few thousand dollars, should continue to send a copy of the annual report to each stockholder of record.

allege shows that at best only isolated cases can be pointed out where marked improvements have taken place except in response to repeated demands from the workers or to forestall the growth of threatened organization. They point also to such facts as that children of 12 years or younger were not only employed in the factories (as they still are in some States where there has been little aggressive agitation), but almost without exception were insisted upon by the employers as a necessity.

The evidence of this character, which is summarized elsewhere, seems to be conclusive of the necessity for organization and representation under modern business conditions. But even if it were not necessary it is difficult to see any reason why what is demanded and required by stockholders should be denied to workers. It would be as illogical for stockholders individually to attempt to deal with the representatives of the unions as it is for the individual worker to attempt to deal with executive officials representing the organized stockholders.

CAUSES OF INDUSTRIAL UNREST.

It is presumed that Congress had in mind, in directing the commission to inquire into the "causes of dissatisfaction in the industrial situation," something far different from that "dissatisfaction with the present which is the hope of the future," that desire for better things which drives men forever forward. Such dissatisfaction is the mainspring of all progress and is to be desired in every nation in all walks of life.

It is believed that Congress intended the inquiry to be directed to that unrest and dissatisfaction which grows out of the existence of intolerable industrial conditions and which, if unrelieved, will in the natural course of events rise into active revolt or, if forcibly suppressed, sink into sullen hatred.

Of the existence of such unrest ample evidence has been found. It is the basis of the establishment and growth of the I. W. W., whose card-carrying members number only a few thousands, but which as "a spirit and a vocabulary" permeates to a large extent enormous masses of workers, particularly among the unskilled and migratory laborers. But entirely apart from those who accept its philosophy and creed, there are numberless thousands of workers, skilled and unskilled, organized and unorganized, who feel bitterly that they and their fellows are being denied justice, economically, politically, and legally. Just how widespread this feeling is or whether there is imminent danger of a quickening into active, nation-wide revolt, none can say. But no one who reads the papers from which the workers get their ideas and inspiration; no one who has studied with care the history of such strikes as those at Lawrence and Paterson, in West Virginia and Colorado, and has understood the temper of the strikers; no one who has associated with large numbers of workers in any part of the country, can fail to be impressed by the gravity of the situation.

This sense of tension and impending danger has been expressed by numerous witnesses before the commission, but by none more forcibly than by Mr. Daniel Guggenheim, a capitalist whose interests in mines and industrial plants extend to every part of the country.

Chairman WALSH. What do you think has been accomplished by the philanthropic activities of the country in reducing suffering and want among the people?

Mr. GUGGENHEIM. There has a great deal been done. If it were not for what has been done and what is being done, we would have revolution in this country.

The sources from which this unrest springs are, when stated in full detail, almost numberless. But upon careful analysis of their real character they will be found to group themselves almost without exception under four main sources which include all the others. The four are:

1. Unjust distribution of wealth and income.
2. Unemployment and denial of an opportunity to earn a living.
3. Denial of justice in the creation, in the adjudication, and in the administration of law.
4. Denial of the right and opportunity to form effective organizations.

1. UNJUST DISTRIBUTION OF WEALTH AND INCOME.

The conviction that the wealth of the country and the income which is produced through the toil of the workers is distributed without regard to any standard of justice is as widespread as it is deep-seated. It is found among all classes of workers and takes every form from the dumb resentment of the day laborer, who, at the end of a week's back-breaking toil finds that he has less than enough to feed his family while others who have done nothing live in ease, to the elaborate philosophy of the "soap-box orator," who can quote statistics unendingly to demonstrate his contentions. At bottom, though, there is the one fundamental, controlling idea that income should be received for service and for service only, whereas, in fact, it bears no such relation, and he who serves least, or not at all, may receive most.

This idea has never been expressed more clearly than in the testimony of Mr. John H. Walker, president of the Illinois State Federation of Labor:

- A workingman is not supposed to ask anything more than a fair day's wage for a fair day's work; he is supposed to work until he is pretty fairly tuckered out, say eight hours, and when he does a fair day's work he is not supposed to ask for any more wages than enough to support his family, while with the business man the amount of labor furnishes no criterion for the amount they receive. People accept it as all right if they do not do any work at all, and accept it as all right that they get as much money as they can; in fact, they are given credit for getting the greatest amount of money with the least amount of work; and those things that are being accepted by the other side as the things that govern in every-day life, and as being right, have brought about this condition, this being in my judgment absolutely unfair; that is, on the merits of the proposition in dealing with the workers.

The workers feel this, some unconsciously and some consciously, but all of them feel it, and it makes for unrest, in my judgment, and there can be no peace while that condition obtains.

In the highest paid occupations among wage earners, such as railroad engineers and conductors, glass blowers, certain steel-mill employees, and a few of the building trades, the incomes will range from \$1,500 to \$2,000 at best, ignoring a few exceptional men who are paid for personal qualities. Such an income means, under present-day conditions, a fair living for a family of moderate size, education of the children through high school, a small insurance policy,

a bit put by for a rainy day—and nothing more. With unusual responsibilities or misfortunes, it is too little, and the pinch of necessity is keenly felt. To attain such wages, moreover, means that the worker must be far above the average, either in skill, physical strength, or reliability. He must also have served an apprenticeship equal in length to a professional course. Finally, and most important, he or his predecessors in the trade must have waged a long, aggressive fight for better wages, for there are other occupations whose demand for skill, strength, and reliability are almost as great as those mentioned, where the wages are very much less.

These occupations, however, include but a handful compared to the mass of the workers. What do the millions get for their toil, for their skill, for the risk of life and limb? That is the question to be faced in an industrial nation, for these millions are the backbone and sinew of the State, in peace or in war.

First, with regard to the adult workmen, the fathers and potential fathers, from whose earnings, according to the "American standard," the support of the family is supposed to be derived.

Between one-fourth and one-third of the male workers 18 years of age and over, in factories and mines, earn less than \$10 per week; from two-thirds to three-fourths earn less than \$15, and only about one-tenth earn more than \$20 a week. This does not take into consideration lost working time for any cause.

Next are the women, the most portentously growing factor in the labor force, whose wages are important, not only for their own support or as the supplement of the meager earnings of their fathers and husbands, but because, through the force of competition in a rapidly extending field, they threaten the whole basis of the wage scale. From two-thirds to three-fourths of the women workers in factories, stores and laundries, and in industrial occupations generally, work at wages of less than \$8 a week. Approximately one-fifth earn less than \$4 and nearly one-half earn less than \$6 a week.

Six dollars a week—what does it mean to many? Three theater tickets, gasoline for the week, or the price of a dinner for two; a pair of shoes, three pairs of gloves, or the cost of an evening at bridge. To the girl it means that every penny must be counted, every normal desire stifled, and each basic necessity of life barely satisfied by the sacrifice of some other necessity. If more food must be had than is given with 15-cent dinners, it must be bought with what should go for clothes; if there is need for a new waist to replace the old one at which the forewoman has glanced reproachfully or at which the girls have giggled, there can be no lunches for a week and dinners must cost 5 cents less each day. Always too the room must be paid for, and back of it lies the certainty that with slack seasons will come lay-offs and discharges. If the breaking point has come, and she must have some amusement, where can it come from? Surely not out of \$6 a week.

Last of all are the children, for whose petty addition to the stream of production the Nation is paying a heavy toll in ignorance, deformity of body or mind, and premature old age. After all, does it matter much what they are paid? For all experience has shown that in the end the father's wages are reduced by about the amount that the children earn. This is the so-called "family wage," and examination of the wages in different industries corroborates the theory

that in those industries, such as textiles, where women and children can be largely utilized, the wages of men are extremely low.

The competitive effect of the employment of women and children upon the wages of men, can scarcely be overestimated. Surely it is hard enough to be forced to put children to work, without having to see the wages of men held down by their employment.

This is the condition at one end of the social scale. What is at the other?

Massed in millions, at the other end of the social scale, are fortunes of a size never before dreamed of, whose very owners do not know the extent nor, without the aid of an intelligent clerk, even the sources of their incomes. Incapable of being spent in any legitimate manner, these fortunes are burdens, which can only be squandered, hoarded, put into so-called "benefactions" which, for the most part, constitute a menace to the State, or put back into the industrial machine to pile up ever-increasing mountains of gold.

In many cases, no doubt, these huge fortunes have come, in whole or in part, as the rich reward of exceptional service. None would deny or envy him who has performed such service the richest of rewards, although one may question the ideals of a Nation which rewards exceptional service only by burdensome fortunes. But such reward can be claimed as a right only by those who have performed service, not by those who through relationship or mere parasitism chance to be designated as heirs. Legal right, of course, they have by virtue of the law of inheritance, which, however, runs counter to the whole theory of American society, and which was adopted, with important variations, from the English law, without any conception of its ultimate results and apparently with the idea that it would prevent exactly the condition which has arisen. In effect the American law of inheritance is as efficient for the establishment and maintenance of families as is the English law, which has bulwarked the British aristocracy through the centuries. Every year, indeed, sees this tendency increase, as the creation of "estates in trust" secures the ends which might be more simply reached if there were no prohibition of "entail." According to the income-tax returns for 10 months of 1914, there are in the United States 1,598 fortunes yielding an income of \$100,000 or more per year. Practically all of these fortunes are so invested and hedged about with restrictions upon expenditure that they are, to all intents and purposes, perpetuities.

An analysis of 50 of the largest American fortunes shows that nearly one-half have already passed to the control of heirs or to trustees (their vice regents) and that the remainder will pass to the control of heirs within 20 years, upon the deaths of the "founders." Already, indeed, these founders have almost without exception retired from active service, leaving the management ostensibly to their heirs but actually to executive officials upon salary.

We have, according to the income-tax returns, 44 families with incomes of \$1,000,000 or more,¹ whose members perform little or no useful service, but whose aggregate incomes, totaling at the very least \$50,000,000 per year, are equivalent to the earnings of 100,000 wage earners at the average rate of \$500.

The ownership of wealth in the United States has become concentrated to a degree which is difficult to grasp. The recently published

¹ The income tax statistics, as a matter of fact, cover only a period of 10 months in 1914.

researches of a statistician of conservative views¹ have shown that as nearly as can be estimated the distribution of wealth in the United States is as follows:

The "rich," 2 per cent of the people, own 60 per cent of the wealth.

The "middle class," 33 per cent of the people, own 35 per cent of the wealth.

The "poor," 65 per cent of the people, own 5 per cent of the wealth.

This means in brief that a little less than 2,000,000 people, who would make up a city smaller than Chicago, own 20 per cent more of the Nation's wealth than all the other 90,000,000.

The figures also show that with a reasonably equitable division of wealth, the entire population should occupy the position of comfort and security which we characterize as middle class.

The actual concentration has, however, been carried very much further than these figures indicate. The largest private fortune in the United States, estimated at \$1,000,000,000, is equivalent to the aggregate wealth of 2,500,000 of those who are classed as "poor," who are shown in the studies cited to own on the average about \$400 each.

Between the two extremes of superfluity and poverty is the large middle class—farmers, manufacturers, merchants, professional men, skilled artisans, and salaried officials—whose incomes are more or less adequate for their legitimate needs and desires, and who are rewarded more or less exactly in proportion to service. They have problems to meet in adjusting expenses to income, but the pinch of want and hunger is not felt, nor is there the deadening, devitalizing effect of superfluous, unearned wealth.

From top to bottom of society, however, in all grades of incomes, are innumerable number of parasites of every conceivable type. They perform no useful service, but drain off from the income of the producers a sum whose total can not be estimated.

This whole situation has never been more accurately described than by Hon. David Lloyd-George in an address on "Social waste":

I have recently had to pay some attention to the affairs of the Sudan, in connection with some projects that have been mooted for irrigation and development in that wonderful country. I will tell you what the problem is—you may know it already. Here you have a great, broad, rich river upon which both the Sudan and Egypt depend for their fertility. There is enough water in it to fertilize every part of both countries; but if, for some reason or other, the water is wasted in the upper regions, the whole land suffers sterility and famine. There is a large region in the upper Sudan where the water has been absorbed by one tract of country, which, by this process, has been converted into a morass, breeding nothing but pestilence. Properly and fairly husbanded, distributed, and used, there is enough to fertilize the most barren valley and make the whole wilderness blossom like the rose.

That represents the problem of civilization, not merely in this country but in all lands. Some men get their fair share of wealth in a land and no more—sometimes even the streams of wealth overflow to waste over some favored regions, often producing a morass, which poisons the social atmosphere. Many have to depend on a little trickling runlet, which quickly evaporates with every commercial or industrial drought; sometimes you have masses of men and women whom the flood at its height barely reaches, and then you witness parched specimens of humanity, withered, hardened in misery, living in a desert where even the well of tears has long ago run dry.

¹ Prof. Willard I. King, *The Wealth and Income of the People of the United States*.

Besides the economic significance of these great inequalities of wealth and income, there is a social aspect which equally merits the attention of Congress. It has been shown that the great fortunes of those who have profited by the enormous expansion of American industry have already passed, or will pass in a few years, by right of inheritance to the control of heirs or to trustees who act as their "vice regents." They are frequently styled by our newspapers "monarchs of industry," and indeed occupy within our Republic a position almost exactly analogous to that of feudal lords.

These heirs, owners only by virtue of the accident of birth, control the livelihood and have the power to dictate the happiness of more human beings than populated England in the Middle Ages. Their principalities, it is true, are scattered and, through the medium of stock ownership, shared in part with others; but they are none the less real. In fact, such scattered invisible industrial principalities are a greater menace to the welfare of the Nation than would be equal power consolidated into numerous petty kingdoms in different parts of the country. They might then be visualized and guarded against; now their influence invisibly permeates and controls every phase of life and industry.

"The king can do no wrong," not only because he is above the law but because every function is performed or responsibility assumed by his ministers and agents. Similarly our Rockefellers, Morgans, Fricks, Vanderbilts, and Astors can do no industrial wrong, because all effective action and direct responsibility is shifted from them to the executive officials who manage American industry. As a basis for this conclusion we have the testimony of many, among which, however, the following statements stand out most clearly:

Mr. John D. Rockefeller, jr.:¹

* * * Those of us who are in charge there elect the ablest and most upright and competent men whom we can find, in so far as our interests give us the opportunity to select, to have the responsibility for the conduct of the business in which we are interested as investors. We can not pretend to follow the business ourselves.

Mr. J. Pierpont Morgan:

Chairman WALSH. In your opinion, to what extent are the directors of corporations responsible for the labor conditions existing in the industries in which they are the directing power?

Mr. MORGAN. Not at all I should say.

The similitude, indeed, runs even to mental attitude and phrase. Compare these two statements:

Mr. John D. Rockefeller, jr.:

My appreciation of the conditions surrounding wage earners and my sympathy with every endeavor to better these conditions are as strong as those of any man.

Louis XVI:

There is none but you and me that has the people's interest at heart. ("Il n'y a que vous et moi aimions le peuple.")

The families of these industrial princes are already well established and are knit together not only by commercial alliances but by a network of intermarriages which assures harmonious action whenever their common interest is threatened.

¹ Before congressional investigating committee.

Effective action by Congress is required, therefore, not only to readjust on a basis of compensation approximating the service actually performed, the existing inequalities in the distribution of wealth and income, but to check the growth of an hereditary aristocracy, which is foreign to every conception of American Government and menacing to the welfare of the people and the existence of the Nation as a democracy.

The objects to be attained in making this readjustment are: To reduce the swollen, unearned fortunes of those who have a superfluity; to raise the underpaid masses to a level of decent and comfortable living; and at the same time to accomplish this on a basis which will, in some measure, approximate the just standard of income proportional to service.

The discussion of how this can best be accomplished forms the greater part of the remainder of this report, but at this point it seems proper to indicate one of the most immediate steps which need to be taken.

It is suggested that the commission recommend to Congress the enactment of an inheritance tax, so graded that, while making generous provision for the support of dependents and the education of minor children, it shall leave no large accumulation of wealth to pass into hands which had no share in its production.¹ The revenue from this tax, which we are informed would be very great, should be reserved by the Federal Government for three principal purposes:

1. The extension of education.
2. The development of other important social services which should properly be performed by the Nation, which are discussed in detail elsewhere.
3. The development, in cooperation with States and municipalities, of great constructive works, such as road building, irrigation, and reforestation, which would materially increase the efficiency and welfare of the entire Nation.

We are informed by counsel not only that such a tax is clearly within the power of Congress, but that upon two occasions, namely, during the Civil War and in 1898, such graded inheritance taxes were enacted with scarcely any opposition and were sustained by the Supreme Court, which held that the inheritance tax was not a direct tax within the meaning of the Constitution. We are aware that similar taxes are levied in the various States, but the conflict with such State taxes seems to have presented little difficulty during the period in which the tax of 1898 was in effect. Under any circumstances this need cause no great complication, as the matter could be readily adjusted by having the Federal Government collect the entire tax and refund a part to the States on an equitable basis.

There is no legislation which could be passed by Congress the immediate and ultimate efforts of which would be more salutary or would more greatly assist in tempering the existing spirit of unrest.

2. UNEMPLOYMENT AND DENIAL OF OPPORTUNITY TO EARN A LIVING.

As a prime cause of a burning resentment and a rising feeling of unrest among the workers, unemployment and the denial of an op-

¹ It is suggested that the rates be so graded that not more than \$1,000,000 shall pass to the heirs. This can be equitably accomplished by several different gradations of taxation.

portunity to earn a living is on a parity with the unjust distribution of wealth. They may on final analysis prove to be simply the two sides of the same shield, but that is a matter which need not be discussed at this point. They differ in this, however, that while unjust distribution of wealth is a matter of degree, unemployment is an absolute actuality, from which there is no relief but soul-killing crime and soul-killing charity.

To be forced to accept employment on conditions which are insufficient to maintain a decent livelihood is indeed a hardship, but to be unable to get work on any terms whatever is a position of black despair.

A careful analysis of all available statistics shows that in our great basic industries the workers are unemployed for an average of at least one-fifth of the year, and that at all times during any normal year there is an army of men, who can be numbered only by hundreds of thousands, who are unable to find work or who have so far degenerated that they can not or will not work. Can any nation boast of industrial efficiency when the workers, the source of her productive wealth, are employed to so small a fraction of their total capacity?

Fundamentally, this unemployment seems to rise from two great causes, although many others are contributory. First, the inequality of the distribution of income which leaves the great masses of the population (the true ultimate consumers) unable to purchase the products of industry which they create, while a few have such a superfluity that it can not be normally consumed but must be invested in new machinery for production or in the further monopolization of land and natural resources. The result is that in mining and other basic industries we have an equipment in plant and developed property far in excess of the demands of any normal year, the excess being, in all probability, at least 25 per cent. Each of these mines and industrial plants keeps around it a labor force which, on the average, can get work for only four-fifths of the year, while at the same time the people have never had enough of the products of those very industries—have never been adequately fed, clothed, housed, nor warmed—for the very simple reason that they have never been paid enough to permit their purchase.

The second principal cause lies in the denial of access to land and natural resources even when they are unused and unproductive, except at a price and under conditions which are practically prohibitive. This situation, while bound up with the land and taxation policies of our States and Nation, also rests fundamentally upon the unjust distribution of wealth. Land or mineral resources in the hands of persons of average income must and will be used either by their original owners or by some more enterprising person. By the overwhelming forces of economic pressure, taxation, and competition they can not be permitted to lie idle if they will produce anything which the people need. Only in the hands of large owners—free from economic pressure, able to evade or minimize the effects of taxation and to await the ripening of the fruits of unearned increment—can land be held out of use if its products are needed.

There can be no more complete evidence of the truth of this statement than the condition of the farms of 1,000 acres and over, which, valued at two and one-third billion dollars, comprise 19 per cent of all the farm land of the country and are held by less than 1 per cent

of the farm owners. The United States census returns show that in these 1,000-acre farms only 18.7 per cent of the land is cultivated as compared with 60 to 70 per cent in farms of from 50 to 499 acres. Furthermore, it is well known that the greater part of these smaller farms which are left uncultivated are held by real estate men, bankers, and others who have independent sources of income. More than four-fifths of the area of the large holdings is being held out of active use by their 50,000 owners, while 2,250,000 farmers are struggling for a bare existence on farms of less than 50 acres, and an untold number who would willingly work these lands are swelling the armies of the unemployed in the cities and towns.

A basic theory of our Government, which found expression in the homestead acts, was that every man should have opportunity to secure land enough to support a family. If this theory had been carried out and homesteads had either gone to those who would use them productively or remained in the hands of the Government, we should not yet have a problem of such a character. But these acts were evaded; land was stolen outright by wholesale, and fraudulent entries were consolidated into enormous tracts which are now held by wealthy individuals and corporations.

The Public Lands Commission, after an exhaustive inquiry, reported in 1905:

Detailed study of the practical operation of the present land laws shows that their tendency far too often is to bring about land monopoly rather than to multiply small holdings by actual settlers.

* * * Not infrequently their effect is to put a premium on perjury and dishonest methods in the acquisition of land. It is apparent, in consequence, that in very many localities, and perhaps in general, a larger proportion of the public land is passing into the hands of speculators than into those of actual settlers making homes. * * * Nearly everywhere the large landowner has succeeded in monopolizing the best tracts, whether of timber or agricultural lands.

To one who has not read the preceding statements carefully there may seem to be a contradiction in proposing to prevent great capitalists from creating an excess of productive machinery and over-developing mineral resources while pointing out the necessity of forcing land and other natural resources into full and effective use by the people. The two propositions are, as a matter of fact, as fundamentally distinct as monopoly and freedom. The capitalist increases his holdings in productive machinery and resources only because through monopolization and maintenance of prices he hopes to reap rewards for himself or increase his power, while the aim in desiring the full development of land and other resources by the people is that they, producing for themselves, may enjoy a sufficiency of good things and exchange them for the products of others, and thus reduce to a minimum the condition of unemployment.

There are, of course, many other causes of unemployment than the inequality of wealth and the monopolization of land which there is no desire to minimize. Chief among these are immigration, the inadequate organization of the labor market, the seasonal character of many industries, and the personal deficiencies of a very large number of the unemployed. It can not be denied that a considerable proportion of the men who fill the city lodging houses in winter are virtually unemployables as a result of weakness of character, lack

of training, the debasing effects of lodging-house living and city dissipation, and, last but not least, the conditions under which they are forced to work in the harvest fields and lumber, railroad, and construction camps. The seasonal fluctuations of our industries are enormous, employing hundreds of thousands during the busy season and throwing them out on the community during the dull season, and almost nothing has been done to remedy this condition. It would be difficult to imagine anything more chaotic and demoralizing than the existing methods of bringing workmen and jobs together. Certain measures for dealing with these conditions, which are discussed elsewhere in the report, need to be pushed forward with all possible vigor. But it may be confidently predicted that the unemployment situation will not be appreciably relieved until great advances have been made in the removal of the two prime causes—unjust distribution of wealth and monopolization of land and natural resources.

The most direct methods of dealing with the inequality of wealth have already been briefly discussed and will be considered elsewhere in the report. With respect to the land question, however, the following basic suggestions are submitted:

1. Vigorous and unrelenting prosecutions to regain all land, water power, and mineral rights secured from the Government by fraud.

2. A general revision of our land laws, so as to apply to all future land grants the doctrine of "superior use," as in the case of water rights in California, and provision for forfeiture in case of actual nonuse. In its simplest form the doctrine of "superior use" implies merely that at the time of making the lease the purpose for which the land will be used must be taken into consideration, and the use which is of greatest social value shall be given preference.

3. The forcing of all unused land into use by making the tax on nonproductive land the same as on productive land of the same kind and exempting all improvements.

Other measures for dealing with unemployment are discussed under that head on pages 103-115.

The unemployed have aptly been called "the shifting sands beneath the State." Surely there is no condition which more immediately demands the attention of Congress than that of unemployment, which is annually driving hundreds of thousands of otherwise productive citizens into poverty and bitter despair, sapping the very basis of our national efficiency, and germinating the seeds of revolution.

3. DENIAL OF JUSTICE.

No testimony presented to the commission has left a deeper impression than the evidence that there exists among the workers an almost universal conviction that they, both as individuals and as a class, are denied justice in the enactment, adjudication, and administration of law, that the very instruments of democracy are often used to oppress them and to place obstacles in the way of their movement toward economic, industrial, and political freedom and justice. Many witnesses, speaking for millions of workers as well as for themselves, have asserted with the greatest earnestness that the mass of the workers are convinced that laws necessary for their protection against the most grievous wrongs can not be passed except after long and exhausting struggles; that such beneficent meas-

ures as become laws are largely nullified by the unwarranted decisions of the courts; that the laws which stand upon the statute books are not equally enforced; and that the whole machinery of Government has frequently been placed at the disposal of the employers for the oppression of the workers; that the Constitution itself has been ignored in the interests of the employers; and that constitutional guaranties erected primarily for the protection of the workers have been denied to them and used as a cloak for the misdeeds of corporations.

If it be true that these statements represent the opinions of the mass of American workers, there is reason for grave concern, for there are 25,000,000 of them, of whom 3,000,000 are welded together into compact organizations.

But if it be true that these charges are justified; if, in fact, our legislators, our judges, and executives, do not afford equal consideration to the workers and are concerned with protecting the rights of property rather than the rights of men, and at times even become the instruments for the oppression of the poor and humble, then the situation demands and must receive the prompt and decisive action of every right-thinking man in order that these evils may be eradicated and justice and liberty established in the place of injustice and oppression.

Before examining the evidence, it should be understood that it is not charged that such acts of injustice are universal, but that they occur so frequently and in such diverse parts of the country that any man may reasonably fear that he himself or those with whom he is associated may at any time be the victim of injustice or discrimination. It has been urged, and perhaps properly, that the charges would be sustained if it were found that such acts of injustice had been committed only upon rare occasions, if it should also be established that such injustices were allowed to stand without redress, and if those who were guilty of their commission were left unimpeached and unpunished.

An enormous mass of evidence bearing upon these charges has been presented to the commission by witnesses or collected by its staff. This material is presented in some detail in another part of the report, but the summary which follows may be regarded as reasonably full and exact.

First, with regard to the enactment of laws, it is charged that the workers have been unable to secure legislation to protect them against grievous wrongs, except after exhausting struggles against overwhelming odds and against insidious influences.

The evidence bearing upon this question has dealt with the history of three principal lines of legislation in which the evils sought to be remedies are now universally admitted to have been very great, involving wanton destruction of life, the exploitation of women and children, and the practical enslavement of American seamen. A careful examination has been made of the history of attempts to secure adequate legislation to prevent child labor, to protect women against extreme hours of labor and night work, to secure the safety of factories, railroads, and mines, and to provide for the safety, comfort, and liberty of seamen.

The history of child-labor legislation shows that although agitation for the protection and education of children began during the

early part of the nineteenth century in Massachusetts, Rhode Island, Connecticut, New York, and Pennsylvania, no adequate legislation was obtained until nearly the end of the century. Time after time in each of these industrial States the sentiment of the public was aroused, organization was effected, and well-drafted bills were introduced only to be killed in committee, emasculated or killed on the floor of the legislature, or passed with exceptions which rendered them entirely ineffective. Even the attempt to reduce the hours of children below 12 per day was bitterly contested and met by every known trick of legislative chicanery. The whole history of the contest for adequate child-labor legislation is even now being repeated in some of the Southern States, where laws prohibiting the employment of children are bitterly contested and beaten session after session by legislators, unsympathetic or controlled by the cotton-mill interests.

Similarly, although the movement to restrict the working hours of women and to prohibit night work began in Massachusetts and Pennsylvania as early as 1840, the first legislation limiting the hours was the 10-hour bill passed in Massachusetts in 1874, and night work went unregulated until the passage of the act of 1899 in Nebraska.¹

The movement for safety of life and limb in the factories and workshops, although pushed with great vigor in almost every session of the State legislatures after 1880, secured only a few acts providing for such obvious matters as the guarding of set screws and gears, but made practically no provision for their enforcement. No really effective action to promote safety took place until, after many years of hard fighting, the first workmen's compensation acts were passed between 1900 and 1910, which for the first time made the unsafe condition of factories directly expensive.

Even upon the railroads, where the safety of the public as well as of the workers was involved, at least 10 years of constant agitation on the part of the railroad brotherhoods and various interested citizens was necessary before the first Federal act providing for safety appliances was passed in 1893.

In the case of the movement to secure the safety, comfort, and liberty of seamen, it is a matter of record that Andrew Furuseth, president of the seamen's union, backed not only by all the members of his own organization but by the entire American labor movement, attended each session of Congress and devoted his whole energies to securing legislation upon this subject for the entire period of 22 years from 1893 to 1915, when the seamen's bill finally became a law.

Other evidence has been presented covering the long fights to secure legislation to remove the evils of company stores, payment in scrip, prison labor, arbitrary deductions from wages, "sweating," tenement houses, and a number of other matters upon which ade-

¹ It is worthy of note that although the decision on the Massachusetts law was favorable and thus established a precedent (*Commonwealth v. Hamilton Mfg. Co.*, 120 Mass., 383), it was thrown aside by the Illinois court in 1895 in holding unconstitutional a law of that State prescribing an 8-hour day for women (*Ritchie v. People*, 155 Ill., 98), and it was not until 1910 that the same court accepted a 10-hour law as constitutional (*Ritchie v. Wyman*, 244 Ill., 509). The Nebraska statute limited the hours of women to 10 a day and prohibited night work between the hours of 10 p. m. and 6 a. m., but the first case did not raise the question of night work (*Wenham v. State*, 65 Neb., 394). In New York, however, a statute regulating night work was held unconstitutional in 1907 (*People v. Williams*, 189 N. Y., 131), and it was not until the present year that a similar law was sustained (*People v. Schweinler*, 214 N. Y., 395).

quate legislation has not yet been secured, except perhaps in a few States, although there has been unremitting agitation upon these questions for more than half a century. This evidence shows clearly that the workers have just grounds for the charge that the legislatures have been criminally slow in acting for the relief of grievous wrongs and have used every subterfuge to escape adequate and aggressive action, even while thousands of men, women, and children were being killed, maimed, or deformed as a result of their negligence.

Evidence has further been presented to show that such a condition has not been the result entirely of the complacency or slothfulness of legislators, but that powerful influences have been at work to prevent such remedial legislation. The most convincing evidence presented upon this phase of the question is the record of the National Association of Manufacturers and its allied organizations, as contained in the testimony and findings before congressional committees,¹ in the printed reports of that association and in the testimony before the commission of the representatives of various State employers' associations. The substance of this evidence is so well known to Congress and to the public that it is necessary here to call attention only to the fact that the efforts of such associations in preventing the enactment of practically all legislation intended to improve the condition or advance the interests of workers were not confined to Congress, but were even more effective in the State legislatures.

The persistent and bitter manner in which the railroads fought the laws providing for safety appliances, although the measures were moderate and necessary, not only for the safety of the traveling public, but for the efficient operation of the roads, is well known to Congress.

Perhaps the most significant statement regarding the insidious influences of this character is contained in a letter from Mr. L. M. Bowers, chairman of the board of directors of the Colorado Fuel & Iron Co., to the Secretary of Mr. John D. Rockefeller, jr., under date of May 13, 1913:

The Colorado Fuel & Iron Co. for many years were accused of being the political dictator of southern Colorado, and, in fact, were a mighty power in the entire State. When I came here it was said that the C. F. & I. Co. voted every man and woman in their employ without any regard to their being naturalized or not, and even their mules, it used to be remarked, were registered if they were fortunate enough to possess names. Anyhow, a political department was maintained at a heavy expense. I had before me the contributions of the C. F. & I. Co. for the campaign of 1904, amounting to \$80,605, paid out personally by President Hearne. All the vouchers and checks I have examined personally, all of which were payable to Albert A. Miller, upon which he drew the currency and, it is said, handed the money over to Mr. Hearne, who paid it out. So far as I can discover, not one particle of good was accomplished for the company, but Mr. Hearne was an aspirant for the position of United States Senator and devoted a vast amount of time and money with this end in view, I have no doubt.

The company became notorious in many sections for their support of the liquor interests. They established saloons everywhere they possibly could.

¹ U. S. Senate Committee on Judiciary. Maintenance of a Lobby to Influence Legislation. Hearings before a subcommittee pursuant to S. Res. 92, 63d Cong., 1st sess. Charges Against Members of the House and Lobby Activities of the National Association of Manufacturers of the United States and Others. Hearings before select committee of House of Representatives appointed under H. Res. 198, 63d Cong., 1st sess.

This department was managed by one John Kebler, a brother of the one-time president of the company, who died about the time I came here, a victim of his own intemperate habits. A sheriff, elected by the votes of the C. F. & I. Co. employees, and who has been kept in office a great many years, established himself or became a partner in 16 liquor stores in our coal mines. To clean up the saloons and with them the gambling hells and houses of prostitution has been one of the things that Mr. Welborn and I have devoted an enormous amount of time to during the past five years. The decent newspapers everlastingly lampooned the C. F. & I. Co. at every election, and I am forced to say the company merited, from a moral standpoint, every shot that was fired into their camp.

Since I came here ¹ not a nickel has been paid to any politician or political party. We have fought the saloons with all the power we possess. We have forbidden any politician from going into our camps, and every subordinate official connected with the company has been forbidden to influence our men to vote for any particular candidate. We have not lobbied in the legislature, but have gone directly to the governor and other able men and have demanded fair treatment.

Second, it is charged by the workers that after wholesome and necessary laws are passed they are in large part nullified by the courts either upon technicalities of a character which would not be held to invalidate legislation favorable to the interests of manufacturers, merchants, bankers, and other property owners, or thrown out on the broad ground of unconstitutionality, through strained or illogical construction of constitutional provisions. It is argued that such action is doubly evil, because the power to declare legislative acts unconstitutional has been assumed by the courts in the face of a complete absence of legal sanction, in complete disregard of early decisions denying the possession of such power, and in complete contrast to the practices of the courts in every other country of the civilized world. It is not within our province to decide whether or not this assumption of power by the courts was justified. It is sufficient here merely to examine the evidence bearing upon the allegations that laws necessary for the correction of grave industrial abuses are nullified by strained interpretations or for reasons which would be insufficient in other cases, and that they are held unconstitutional upon pretexts which in reality are the outgrowth of economic bias on the part of the judges.

A large number of decisions illustrating these points have been brought to the attention of the commission, but only a few need be cited here. It has been held, for example, even that statutes requiring dangerous machinery to be guarded may be disobeyed by the employer, and children employed about such unguarded machinery are held to have assumed the risk.² The same has been held regarding the employment of women.³

Many other cases might be cited on the question of strained interpretation,⁴ bearing out the assertion made by Justice Lurton, of

¹ This statement of Mr. Bowers should be considered in conjunction with his testimony that the evil influences created by the Colorado Fuel & Iron Co. were still in power and his admission that the company was deeply interested in the last State election and that 150 men were put into the field from his office alone to work for the candidates favored by the company, which was deeply interested in the election of officials who would vigorously prosecute the strikers. His letters narrating how the governor of Colorado was whipped into line should also be considered, as well as the testimony of Dr. E. S. Gaddis, former head of the sociological department of the Colorado Fuel & Iron Co., that officials openly influenced elections.

the Federal Supreme Court, when, in a case not involving industrial relations, he says:

The judgment just rendered will have, as I think, the effect to defeat the clearly expressed will of the legislature by a construction of its words that can not be reconciled with their ordinary meaning.¹

Probably there are no other cases which have created so much bitterness as those of personal injury in which the plaintiffs have been denied recovery of damages on the principles of "fellow servant," "assumption of risk," and "contributory negligence," and the obstacles which have been created by the courts to prevent the removal of these defenses for the employer have served only to intensify the feeling. The contrast in attitude of the judges can not better be shown than by considering that while they have held each employee of a corporation responsible under these three principles not only for his own involuntary acts but for the physical condition of the entire property and the conduct of each of his fellow workers; they have repeatedly absolved officials, directors, and stockholders from responsibility for accidents, even when the unsafe condition of the property had been published, or when orders had been issued which were directly responsible for the accidents. It would hardly be an exaggeration to say that, if the courts had held officials and directors to as great a degree of responsibility as employees for the condition of the property and the actions of their agents, there is hardly one who would have escaped punishment for criminal negligence. According to the best estimates, approximately 35,000 persons were killed last year in American industry, and at least one-half of these deaths were preventable.² What would be the situation if the courts, following the clear logic of their own decisions, should hold the stockholders, directors, and officials criminally responsible for each of the 17,500 preventable deaths to which attention has time after time been directed?

That the courts, including even the highest tribunal of the Nation, do allow their economic bias to influence them in holding laws unconstitutional is nowhere more clearly expressed than in the dissenting opinion of Mr. Justice Holmes in the case of *Lochner v. New York*,³ wherein the right of the Legislature of New York to limit the hours of work in bakeries was involved. He said:

This case is decided upon an economic theory which a large part of the country does not entertain. If it were a question whether I agree with that theory [limiting the consecutive hours of labor in bakeries which may be required of an employee], I should desire to study it further and long before making up my mind. But I do not conceive that to be my duty, because I strongly believe that my agreement or disagreement has nothing to do with the right of a majority to embody their opinions in law.

* * * Some of these laws [referring to several which he has discussed] embody convictions or prejudices which judges are likely to share. Some may not, but a constitution is not intended to embody a particular economic theory, whether of paternalism and the organic relation of the citizen to the State, or of *laissez faire*. It is made for people of fundamentally differing views, and the accident of our finding certain opinions natural and familiar or novel, and even shocking, ought not to conclude our judgment upon the question whether statutes embodying them conflict with the Constitution of the United States.

¹ *Thompson v. Thompson*, 218 U. S., 611.

² Industrial Accident Statistics, Bul. Whole No. 157, U. S. Bureau of Labor Statistics, 1915.

³ *Lochner v. N. Y.*, 198 U. S., 45.

This statute of the State of New York, which had been sustained by the courts of New York, was thus held unconstitutional, we are assured by the highest possible authority, on the economic theories of five judges, whose bias is clearly reflected in the majority opinion. By that action not only were the bakers of New York deprived of all legal relief from the hardships of working long hours in underground bakeries, but the entire movement for relieving the condition of other workmen in similarly unhealthful occupations throughout the country was effectually checked for a decade. Can these judges, the workers ask, absolve themselves from responsibility for the thousands of lives which have been shortened as a result of their decisions, the ill health and suffering of other thousands who contracted disease as a result of unduly long exposure to bad conditions and a lack of sufficient fresh air and leisure? The provision of the Constitution which was held to be violated by this act was the fourteenth amendment, designed solely to protect the emancipated negroes.

The wide range of the labor laws declared unconstitutional may be seen from the following list, which includes only those cases which may be clearly understood from their titles:

LABOR LAWS DECLARED UNCONSTITUTIONAL.

- Requiring statement of cause of discharge.¹
- Prohibiting blacklisting.²
- Protecting workmen as members of labor unions.³
- Restricting power of courts to grant injunctions, etc.⁴
- Protecting employees as voters (Federal).⁵
- Forbidding public employment office to furnish names of applicants to employers whose workmen were on strike.⁶
- Fixing rates of wages on public works.⁷
- Regulating weighing of coal at mines (four States).⁸
- Providing for small attorneys' fees in successful actions to recover wage claims.⁹
- Fixing the time of payment of wages.¹⁰
- Prohibiting use of "scrip."¹¹
- Prohibiting or regulating company stores.¹²
- Fixing hours of labor in private employment.¹³
- Defining liability of employers for injuries.¹⁴

It is difficult to find parallel cases to illustrate the difference in the point of view assumed by the courts upon the same constitutional question according to economic or social results of the decisions in

different cases. There are a few clear-cut cases, however, in which the contrast is plainly shown, as, for example, in the inconsistency between the decisions in the Debs case,¹ wherein it is held that the control of Congress over interstate commerce is so complete that it may regulate the conduct of the employees engaged therein to the extent of enjoining them from going on a sympathetic strike, and the decision in the Adair case,² wherein it is held that Congress has so little power over the conduct of those engaged in interstate commerce that it can not constitutionally forbid employers engaged therein discharging their employees merely because of membership in a labor union.

In this same connection it is proper to contrast the almost uniform prohibition by the State and Federal courts of secondary boycotts in labor cases even to the extent of enjoining the publication of "unfair lists," with the decision in the case of *Park Co. v. Druggists' Association* (175 N. Y.). In this case the Park Co. charged that the Druggists' Association fixed prices of proprietary medicines; that they refused to sell to anyone who did not abide by the prices thus fixed; that the druggists combined in this association refused to sell to the Park Co.; and that they used spies to ascertain with whom the Park Co. did business with intent to compel such customers to cease doing business with the Park Co. The facts were admitted on demurrer, but the court refused to issue an injunction, holding that the boycott was caused by plaintiff himself and could be removed whenever he saw fit to abide by the association's rules; and, further, that there was no conspiracy. If the same line of reasoning were followed in labor cases, it is difficult to imagine any kind of boycott which would be illegal.

Finally, reference should be made to the history of the fight for the enactment of eight-hour legislation in Colorado, which illustrates the grounds upon which the workers not only of that State, but throughout the Nation, distrust legislatures, courts, and executive officials.

Although the 8-hour day was established in Colorado gold mines by agreement among the operators after the Cripple Creek strike of 1894, in the coal-mining industry a 20-year struggle followed the miners' first attempt at legislation.

The eight-hour bill presented to the general assembly in 1895, though supported by the Western Federation of Miners, the United Mine Workers of America, and labor organizations in general, was, upon reference to the Supreme Court for an advance opinion, reported as unconstitutional and failed of enactment.

A bill brought successfully to enactment in 1899, and which was substantially a copy of the Utah law upheld by State and Federal Supreme Courts, was declared by the Colorado Supreme Court to be unconstitutional.³

In 1901 the people adopted by an overwhelming vote an amendment to the constitution which provided for eight-hour legislation. This was followed by the introduction in the next general assembly (1903) of several bills, and by the inauguration of active opposition thereto on the part of corporations. No fewer than 11 anonymous bulletins were attributed to one officer of a smelting company.

¹ 158 U. S., 564.

² 208 U. S., 161.

³ In re Morgan, 26 Colo., 415.

On account of disagreements in conference, none of the several bills passed; and so great was the public outcry that at the extra session in July, 1903, each house passed resolutions blaming the other for the failure.

In the session of 1904-5 a bill substantially the same as the present law, and favored by all political parties, was so amended by Mr. Guggenheim as to be "absolutely worthless." It remained on the statute books, a dead letter, until 1911.

In 1911, house bill No. 46 was passed. The operators succeeded in having it submitted to a referendum vote, and at the last moment they initiated a smelterman's eight-hour bill, the two came up on the same ballot, and in the succeeding confusion both were adopted by the people, because of their genuine interest in the passage of an eight-hour law.

The legislature of 1913 repealed both the laws so enacted in 1911, and reenacted house bill No. 46, the present law. By a decision of the Supreme Court, allowing a "safety clutch," this law may not be referred.

The essential injustice and stupidity of this long fight of the employers against eight-hour legislation is strikingly shown by a letter from Mr. L. M. Bowers, chairman of the board of directors of the Colorado Fuel & Iron Co., to Mr. J. D. Rockefeller, jr., stating that after they saw that such legislation was inevitable, they tried out the eight-hour day in their mines and found that it was economically profitable. The Colorado Fuel & Iron Co. thereby is shown to have stubbornly resisted by every conceivable device, for a period of 20 years, a just law which was not only necessary for the health and welfare of its 12,000 miners but was actually profitable for the company itself.

The reason for the effectiveness of the opposition of the Colorado Fuel & Iron Co. is also shown in the letter quoted on page 41 from Mr. Bowers to the secretary of Mr. Rockefeller, describing the complete and corrupt control which the company exercised over the State government during this period.

Third, it is alleged by the workers that in the administration of law, both common and statute, there is discrimination by the courts against the poor and in favor of the wealthy and powerful. It is further stated that this discrimination arises not only from the economic disabilities of the poor, which render them unable to employ equally skillful lawyers, to endure the law's delay, and to stand the expense of repeated appeals, but out of an actual bias on the part of the judges in favor of the wealthy and influential. It should arouse great concern if it be true that the courts do not resolve their doubts in favor of the poor and humble; how much graver then is the injustice if the judges do in fact lean toward the rich and mighty?

To establish this claim by the presentation of a sufficient number of cases would be a tedious task. Many such have been presented to the commission but can not be considered fully here. Instead, it would seem that in such cases we may safely rely upon the uncontradicted opinion of weighty authorities whose position removes from them any suspicion of bias.

Ex-President William H. Taft has said:

We must make it so that the poor man will have as nearly as possible an equal opportunity in litigating as the rich man; and under present conditions, ashamed as we may be of it, this is not the fact.

Prof. Henry R. Seager, of Columbia University, testified before the commission:

I don't see how any fair-minded person can question but what our judges have shown a decided bias in favor of the employers. I would not be inclined to ascribe this so much to a class bias, although I think this is a factor, as to the antecedent training of judges. Under our legal system the principal task of the lawyer is to protect property rights, and the property rights have come to be concentrated more and more into the hands of corporations, so that the successful lawyer of to-day, in a great majority of cases, is the corporation lawyer. His business is to protect the rights of employers and corporations. It is from the ranks of successful lawyers, for the most part, that our judges are selected, and from that results inevitably a certain angle on the part of a majority of our judges.

The bias of the courts is nowhere more clearly shown than in cases involving persons and organizations with whose economic and social views the court does not agree. An interesting example may be cited in the case of *Warren v. United States*, 183 Fed., 718, where the editor of *Appeal to Reason*, Fred D. Warren, was sentenced by the Federal district court to six months' imprisonment and a fine of \$1,500 for the circulation through the mails of matter offering a reward to anyone who would kidnap a certain governor for whom extradition had been refused.¹

The sentence was commuted by President Taft, against the protest of Warren, to a fine of \$100 to be collected in a civil suit. In commenting on the sentence, President Taft is reported to have said:

The district court evidently looked beyond the record of the evidence in this case and found that Warren was the editor and publisher of a newspaper engaged in a crusade against society and government.

Moreover, this is not a prosecution for criminal libel; it is a prosecution for what at best is the violation of a regulation as to the use of the mails. To visit such an offense with a severe punishment is likely to appear to the public to be an effort to punish the defendant for something that could not be charged in the indictment.

This obviously was not intended as a reflection upon the court, but the attitude of a large part of the workers is that if President Taft was justified in making such an assertion it was a case demanding impeachment of the judges involved rather than a commutation of sentence for Warren.

Fourth, it is charged by the representatives of labor not only that courts have neglected or refused to protect workers in the rights guaranteed by the Constitution of the United States and of the several States, but that sections of the Constitution framed primarily to protect human rights have been perverted to protect property rights only and to deprive workers of the protection of rights secured to them by statutes.

First, with regard to the Federal courts, it is startling and alarming to citizens generally, and particularly to workers, to learn that the concensus of Federal decisions is to the effect that the sections of the Constitution defining the rights of citizens to trial by jury,

¹ It was alleged by Warren that this was done to call attention to the gross discrimination in the case of Haywood and Moyer, who were kidnaped and transported from one State to another.

security from unwarranted arrest and search, free speech, free assembly, writ of habeas corpus, bearing of arms, and protection from excessive bail and cruel and unusual punishments, apply only to Federal jurisdiction and in reality protect the citizen only against the action of the Federal Government. The only sections protecting the personal rights of citizens under ordinary circumstances are the thirteenth amendment, prohibiting involuntary servitude, the fifteenth, protecting the right to vote, and the fourteenth, providing that "No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property, without due process of law, nor deny any person within its jurisdiction the equal protection of the laws."

We are, however, informed by counsel who has examined the cases involved that the fourteenth amendment has had no appreciable effect in protecting personal rights. According to the existing decisions, the due-process clause does not guarantee the right of trial by jury,¹ nor does it necessitate indictment by grand juries,² nor has it restrained arbitrary arrests and imprisonment on the part of State governments when men are kidnaped in one State and carried to another.³

Up to 1911 the United States Supreme Court intervened in 55 cases in which the fourteenth amendment was invoked. In 39 of these cases private corporations were the principal parties. Thirty-two statutes were affected by these decisions, and in only three, concerning the civil rights of negroes, were the personal rights of individual citizens involved. With the exceptions involving the rights of negroes in jury cases (e. g., *Strauder v. West Virginia*, 100 U. S., 303), the fourteenth amendment has not acted to secure or protect personal rights from State encroachment,⁴ but only to prevent encroachment on property rights.⁵ In all the other numerous cases in which the fourteenth amendment was invoked to protect personal rights, the attempt failed.

On the other hand there is abundant evidence of the great protection which it affords corporations and other forms of organized capital. On that point we may quote the statements of Mr. C. W. Collins, of the Alabama bar, who analyzed the decisions of the United States Supreme Court through the October, 1910, term.⁶

Private corporations are using it as a means to prevent the enforcement of State laws. Since 1891 a majority of cases under the amendment have involved a corporation as the principal party. * * * The increase of this kind of litigation runs parallel to the rise of the trust movement in America. At the 1909-10 term of the court, out of a total of 26 opinions rendered under the amendment 20 involved a corporation as the principal party.

* * * The fourteenth amendment is the easiest of all constitutional measures to invoke. In a country where economic activity is so intense and time so vital an element, it has been grasped as a sure measure of delay, with always the possibility of obtaining affirmative relief. The amendment, though intended primarily as a protection to the negro race, has in these latter days be-

⁶ *The Fourteenth Amendment and the States*, C. W. Collins.

come a constitutional guaranty to the corporations that no State action toward them can become effective until after years of litigation through the State and Federal courts to the Supreme Court of the United States. The course of the amendment is running away from its originally intended channel (p. 145).

The fourteenth amendment, although a humanitarian measure in origin and purpose, has been within recent years practically appropriated by the corporations. It was aimed at restraining and checking the powers of wealth and privilege. It was to be a charter of liberty for human rights against property rights. The transformation has been rapid and complete. It operates to-day to protect the rights of property to the detriment of the rights of man. It has become the Magna Charta of accumulated and organized capital (p. 137).

It is thus quite clear that the fourteenth amendment not only has failed to operate to protect personal rights but has operated almost wholly for the protection of the property rights of corporations. These facts taken in conjunction with the many decisions, such as the *Lochner* case,¹ in which the fourteenth amendment has been invoked to annul statutes designed to better conditions of life and work, must constitute just ground for grave concern not only to the workers but to every citizen who values his liberty.

With the "bills of rights" contained in the constitutions of the several States, the situation, as far as the workers are concerned, is somewhat different, since in many jurisdictions these have been used upon numerous occasions to afford substantial protection to them in their personal rights. The workers call attention particularly, however, to the long list of statutes, city ordinances, and military orders abridging freedom of speech and press, which not only have not been interfered with by the courts but whenever tested have almost uniformly been upheld by the State and Federal courts.² They point also to the grave injuries done to workers individually and collectively by the thousands of arrests which have been made without just cause in labor disputes, without relief from either the courts or the executive; to the denial of the right to the writ of habeas corpus upon numerous occasions; to the fact that where, as for example, in Los Angeles, San Diego, and Fresno (Cal.), Spokane (Wash.), Minot (N. Dak.), Paterson (N. J.), Little Falls (N. Y.), Lawrence (Mass.), Idaho, Colorado, and West Virginia, workers have been grievously injured, brutally treated, or interfered with in the pursuit of their guaranteed rights by other classes of citizens or by officials, the courts have not interfered and the perpetrators have gone unpunished.

On the general question of martial law and habeas corpus a member of the staff has made an elaborate comparison of the cases arising from nonlabor disturbances with the cases arising from labor disturbances. It is not necessary, and would require too much space, to recite these cases in full, but among the former may be mentioned the *Milligan* case, and other cases arising in the State courts of Indiana, Illinois, Kentucky, North Carolina, and Wisconsin³ (all during or immediately following the Civil War), and three cases in the courts of Kentucky, Ohio, and Oklahoma since that time;⁴ among

¹ *Lochner v. N. Y.*, 198 U. S., 45.

³ *In re Milligan*, 4 Wall. (U. S.), 2; *Skeen v. Monkeimer*, 21 Ind., 1; *Johnson v. Jones*, 44 Ill., 142; *Corbin v. Marsh*, 2 Dur., 193; *Ex parte Moore*, 64 N. C., 802; *In re Kemp*, 16 Wis., 382.

⁴ *Franks v. Smith*, 142 Ky., 232; *Ohio v. Coit*, 8 Ohio, 62; *Fluke v. Canton*, 31 Okla., 718.

the latter, i. e., those arising from labor disturbances, are included the cases from Colorado, Idaho, Montana, Pennsylvania, and West Virginia.¹ The results of such comparison are summarized in part as follows:

Although uniformly held that the writ of habeas corpus can only be suspended by the legislature, in these labor disturbances the executive has in fact suspended or disregarded the writ. In the labor cases the judiciary either disregards the fact that the writ has been suspended by the executive or evades the issue. In nonlabor cases the courts have protested emphatically when the executive attempted to interfere with the writ of habeas corpus.

In many instances in which the military has been in active operation because of nonlabor disturbances, the judiciary has almost without exception protested against the exercise of any arbitrary power and has almost uniformly attempted to limit that power.

In cases arising from labor agitations, the judiciary has uniformly upheld the power exercised by the military, and in no case has there been any protest against the use of such power or any attempt to curtail it, except in Montana, where the conviction of a civilian by military commission was annulled.

Finally, it is impossible to imagine a more complete mockery of justice and travesty upon every conception of fair dealing than the innumerable decisions holding unconstitutional wise and salutary laws for the protection of workers, upon the ground that they violate the right of contract, even while the workers, whose rights are supposed to be affected, clamor for the maintenance of the statute. The appeal for the protection of the workers' rights in such cases comes invariably from the employers, and is urged against the protest of the workers, yet in almost unbroken succession the judges solemnly nullify the wisest acts of legislatures on just such specious, self-serving pleas. There are notable cases in which the judges have unmasked the mummery, as, for example, in *Holden v. Hardy*,² where it was said:

Although the prosecution in this case was against the employer of labor, who, apparently, under the statute, is the only one liable, his defense is not so much that his right to contract has been infringed upon, but that the act works a peculiar hardship to his employees, whose right to labor as long as they please is alleged to be thereby violated. The argument would certainly come with better grace and greater cogency from the latter class.

There appear to be no reported cases in which the workers have urged that their rights are violated by such restrictive legislation, which in fact invariably originates with them; but the courts continue to hand down decisions "protecting the sacred right of contract of the worker," when the only person benefited is the employer, who is thus able to "turn the very Constitution itself into an instrument of inequality."

This entire situation is fraught with such grave dangers not only to the workers but to all citizens who value their individual liberty, that the Nation can not be entirely secure until those fundamental rights are affirmatively guaranteed to every citizen of the United States by the Federal Government. It is therefore earnestly recommended that Congress forthwith initiate an amendment to the Constitution securing these rights against encroachment by Federal, State, or local governments or by private persons and corporations.

Fifth. It is charged that the ordinary legal machinery provides no adequate means whereby laborers and other poor men can secure

¹ In re Moyer, 35 Colo., 159; in re Boyle, 6 Idaho, 609; In re McDonald, 49 Mont., 455; Com. v. Shortall, 206 Pa., 165; Mays and Nance v. Brown, 71 W. Va., 519; Ex parte Jones, 71 W. Va., 567.

² 169 U. S., 366.

redress for wrongs inflicted upon them through the nonpayment of wages, through overcharges at company stores, through exorbitant hospital and other fees, fines, and deductions through fraud on the part of private employment offices, loan offices, and installment houses, and through the "grafting" of foremen and superintendents. The losses to wage earners from these sources are stated to amount each year to millions of dollars and to work untold hardship on a class of men who can ill afford to lose even a penny of their hard-won earnings.

These charges were thoroughly investigated in all parts of the country by an experienced member of the commission's staff.

He cites, for example, that in California, where the situation has been more completely uncovered than elsewhere and where remedies are beginning to be applied, during the year ending June, 1914, 9,621 claims were presented to the commissioner of labor alone. Of these, 7,330 were for nonpayment of wages, of which 4,904 were successfully settled and \$110,912 of unpaid wages was collected. This is believed to have been only a small proportion of the total claims of laborers throughout the State, inasmuch as the number of claims was growing rapidly as the work of the bureau became better known, and because, during a period of only 10 months, over 2,200 claims were presented to the State commission on immigration and housing. The work of handling these claims and making its existence known to laborers throughout the State was just getting well under way, although with a small appropriation and inadequate force, when the collection of wage claims was suddenly checked by a decision of the State court of appeals¹ that the payment-of-wages law was unconstitutional on the ground that since it provided for fine or imprisonment where the wages of laborers were illegally retained, it was in effect a provision for imprisonment for debt.

The investigation in other States revealed equally bad or worse conditions, while in all except a few no efficient means existed by which these claims could be prosecuted. In conclusion, our investigator reported:

(a) The existing labor and life conditions of common laborers in this country produce immense numbers of justified labor complaints and claims, involving not only great sums of money in the aggregate but untold personal hardship and suffering.

(b) The existing public and private legal institutions are utterly inadequate to secure justice to the laborers in the matter of these complaints and claims.

(c) This situation has already created in the laborers distrust of the Government, of employers, and of the well-to-do classes generally, and is one of the contributory causes of the existing industrial unrest.

The measures recommended, which have to do largely with State and local administrations, are discussed on page 89. It is suggested, however, that the commission recommend to Congress that, inasmuch as the immigrant laborers, who suffer most largely from these injustices, are ethically and legally wards of the Nation until they become citizens, the Bureau of Immigration of the Federal Department of Labor should be given the authority and necessary

appropriations to establish, wherever it may seem necessary, in connection with its existing offices in all parts of the country, legal aid divisions which would freely and aggressively prosecute these claims and complaints on behalf of the immigrant laborers, and, if there are no constitutional or statutory barriers, on behalf also of American citizens.

Sixth. It is charged by the workers that the courts, by the unwarranted extension of their powers in the issuance of injunctions, have not only grievously injured the workers individually and collectively upon innumerable occasions but have, by the contempt procedure consequent upon disobedience to such injunctions, deprived the workers of the right, fundamental to Anglo-Saxon institutions, to be tried by jury.

This charge is not limited to members of trades-unions, nor to workers, but is voiced also by many who have no reason for partisanship. For example, Mr. S. S. Gregory, former president of the American Bar Association, testified before the commission:

These injunctions are based upon the theory that the man carrying on a business has a certain sort of property right in the good will or the successful conduct of that business; and that when several hundred or several thousand excited men gather around his premises where he carries his business on and threaten everybody that comes in there to work, and possibly use violence, that that is such an unlawful interference with property right as may be the subject of protection in equity. And that view of the law has been sustained by the courts of practically all the States.

But the great difficulty about this was this, that having enjoined defendants, namely, striking workmen, perhaps from unlawful interference with the business of the employer, where that unlawful interference consisted in an attack or an assault and battery upon another man, to wit, perhaps a strikebreaker so-called, or one who was hired to take the place of one of the striking workmen, that thereafter the judge who had ordered the injunction and whose authority had been thus defied, was permitted to put the person charged with the breach of that injunction upon trial upon a charge of contempt, really for having committed an unlawful and criminal act.

Now the Constitution has thrown around the prosecution of criminals (the Constitutions, State and Federal) a number of securities. They are entitled to trial by jury; they are entitled to be confronted by the witnesses who are to testify against them; they are entitled to be heard by counsel.

But none of those guaranties except perhaps the right to be heard by counsel is secured in contempt proceedings; and the obvious wisdom of permitting 12 men drawn from the body of the people to pass on questions of fact—men who are supposed to be prejudiced neither for nor against the parties, who know nothing about the case until they are sworn in the jury box—has so far commended itself to the wisdom of legislators and jurists to such a degree that it has become a permanent feature of our jurisprudence; and to provide that the court may proceed against parties for contempt, where the conduct charged against them is criminal, is really an evasion of the constitutional guaranties and a plain attempt to commit to equity jurisdiction over matters which it has been decided over and over again by all the courts that it has no jurisdiction with respect to, namely, the administration of the criminal law.

For instance, I might receive, as I leave the room of this tribunal to-day, a threatening letter from somebody saying they were going to kill me for something I had said, or had not said, before the commission. Now, that involves personal loss possibly to my wife or those dependent upon me; but no court of equity would listen for a moment to a bill I should file saying "A B" or some other blackhand gentleman had threatened to kill me, or if filed by anybody dependent upon me, and therefore there should be an injunction to prevent him from killing me. That would be an absurdity—a legal absurdity; and none the less is it so where a man is enjoined from committing acts of violence in a strike to try him for contempt, without a trial by jury. And that has been an injustice that has rankled in the minds of everybody that has been a victim of it, and justly so.

Sir Charles Napier says, "People talk about agitators, but the only real agitator is injustice; and the only way is to correct the injustice and allay the agitation."

Judge Walter Clark, chief justice of the Supreme Court of North Carolina, also testified before the commission as follows:

Chairman WALSH. Have you studied the effect of the use of injunctions in labor disputes generally in the United States, as a student of economics and the law?

Judge CLARK. I do not think they can be justified, sir, * * * [Their effect] has been, of course, to irritate the men, because they feel that in an Anglo-Saxon community every man has a right to a trial by jury, and that to take him up and compel him to be tried by a judge is not in accordance with the principles of equality, liberty, and justice.

Chairman WALSH. Do you think that has been one of the causes of social unrest in the United States?

Judge CLARK. Yes, sir; and undoubtedly will be more so, unless it is remedied.

It is not within the province of the commission to attempt to decide the question of whether or not the issuance of such injunctions is an unwarranted extension upon the part of the courts; but the weighty opinions cited above are very impressive and are convincing that the workers have great reason for their attitude. It is known, however, from the evidence of witnesses and from the information collected by the staff, that such injunctions have in many cases inflicted grievous injury upon workmen engaged in disputes with their employers, and that their interests have been seriously prejudiced by the denial of jury trial, which every criminal is afforded, and by trial before the judge against whom the contempt was alleged.

It is felt to be a duty, therefore, to register a solemn protest against this condition, being convinced of its injustice not only by reason of the evil effects which have resulted from this procedure, but by virtue of a conviction that no person's liberty can safely be decided by any one man, particularly when that man is the object of the alleged contempt.

The Clayton Act undoubtedly contains many features which will relieve this situation as far as the Federal courts are concerned, but it seems clear that it does not contain anything like a complete solution of the existing injustices, even for the limited field of Federal jurisdiction.

Seventh, it is charged by the representatives of labor that laws designed for the protection of labor in workshops and mines and on railroads are not effectively enforced, except in a few States. This is a matter of considerable moment to labor, but it is, after all, regarded by the workers, since it concerns chiefly only their safety and comfort, as ranking far below the other matters discussed, which involve primarily their liberty and rights as freemen and, secondarily, their only means of bettering their condition. Moreover, it is almost entirely a matter of administration, which is discussed in detail elsewhere in the report. With the great attention which the method of administration is now receiving, not only from labor organizations but from civic organizations, and lately even from employers' associations, it is likely to reach a satisfactory stage before very long.

Eighth, it is charged that in cases involving industrial questions, the workers are liable to great injustice by reason of the fact that in many localities they are excluded from juries either by the qualifications prescribed (usually payment of property tax) or by the method of selection.

In California, for example, it was testified that grave injustice had been done in many cases because the juries (composed only of property owners, for the most part employers) were greatly prejudiced against the defendants, whose program, if successful, would directly or indirectly affect the interests of the jurors.

Similarly, in Cook County, Ill., which includes Chicago, it was found by a committee of the Lawyers' Association of Illinois that although the system of selection by commissioners was intended to produce an impartial selection from all classes of the community, out of probably 1,000 different occupations in Cook County the commissioners confine the selection of the great bulk of the jurors to the following 10 occupations: Managers, superintendents, foremen, presidents and owners of companies, secretaries of companies, merchants, agents, salesmen, clerks, and bookkeepers.

To quote from the report:

There are 76,000 mechanics affiliated with the Building Trades Council in Chicago, yet in the 3,440 jurors investigated by your committee there are only 200 mechanics drawn from the 76,000 in the Building Trades Council.

There are about 200,000 mechanics belonging to the different labor organizations in Chicago, yet there are only about 350 mechanics drawn as jurors by the commissions in the 3,440 investigated, or about 10 per cent, when the percentage ought to be about 70 per cent.

The report of the committee adds:

Another comparison will show that out of these 3,440 jurors the commission took only 314 jurors from 130 different occupations, or an average of less than 3 jurors from each occupation, while from the 10 favored occupations mentioned above, 1,723 jurors were picked, or the grossly excessive average of 172 from each of said 10 occupations.¹

A similar situation was disclosed by the investigations of members of the staff in Paterson, N. J.

Finally, there is the very grave situation where, by putting aside the legal and customary methods, the jury is chosen by the sheriff or other officers, who may be unduly influenced by either party to the case. Such a situation, inimical in the extreme to the interests of the workers, has been conclusively proved to have existed in Colorado and in other mining districts.

In the belief that the right to trial by an impartial jury is necessary for the maintenance of justice, and that such impartiality can be secured only by including all classes of citizens, it is suggested that the commission recommend that Federal and States statutes should be passed providing for the creation of juries by drawing the names from a wheel, or other like device, which shall contain the name of every qualified voter in the district from which the jury is to be selected. The adoption of this method in Missouri and other States has resulted uniformly in securing impartial juries of much higher grade, and has also eliminated almost entirely the sources of corruption attending the selection of juries.

Ninth, it is charged by the workers that, during strikes, innocent men are in many cases arrested without just cause, charged with fictitious crimes, held under excessive bail, and treated frequently with unexampled brutality for the purpose of injuring the strikers and breaking the strike.

In support of this charge, the commission has been furnished with evidence showing that in a number of recent strikes large numbers

¹ Eternal Vigilance is the Price of Liberty. Report of committee to the Lawyers' Association of Illinois, 1914.

of strikers were arrested, but that only a small number were brought to trial and relatively few were convicted of any serious offense; that those arrested were, as a rule, required to give heavy bail, far beyond their means, or were detained without trial until their effectiveness as strikers was destroyed; and that in many cases strikers were brutally treated by the police or by special deputies in the pay of the companies. A number of these strikes have been investigated by public hearings of the commission, by members of its staff, or by other departments of the Federal Government. In each of the strikes investigated the charges as made were in essentials substantiated.

In Paterson, N. J., which was investigated with unusual thoroughness and which, because of its size and its location in the most densely populated section, might be considered likely to be free from such abuses, it was found that during the strike of the silk workers 2,238 arrests, charging unlawful assembly or disorderly conduct, were made, and that in all there were 300 convictions in the lower courts. Men arrested for unlawful assembly were held in bail of \$500 to \$5,000. The right of trial by jury was generally denied. Men were arrested for ridiculous reasons, as, for example, for standing on the opposite side of the street and beckoning to men in the mills to come out. This was the allegation on which the charge of unlawful assembly was placed against four men, and for which they were sent to jail in default of \$500 bail, and, although never indicted, the charges still stand against them as a bar to their rights as citizens and voters. Men were fined arbitrarily, as in the case of one who was fined \$10 for permitting strikers to sit on a bench in front of his house. Not more than \$25 worth of damage was done during the entire strike, involving 25,000 workers, and there was no actual violence or attempt at violence on the part of the strikers during the entire strike. Under such conditions the editor of a local paper was arrested, charged with criminal libel, for comparing the conditions in Paterson with the rule of Cossacks; and four men who sold the paper on the streets also were arrested. The editor was tried and convicted in the lower court, but the verdict was set aside by the Supreme Court, while the four men, after being held several days in default of bail, were released without trial.

It is impossible to summarize the activities of the police and authorities during this strike better than by referring to the testimony of two of the leading citizens of Paterson, who said that they had resolved to get rid of the "agitators" and were ready to go beyond the law to accomplish their purpose.¹ A full appreciation of the

¹ In a letter recently received from one of these witnesses his position is reiterated with a striking illustration of inability to comprehend the fundamental principles of American Government and the limitations imposed upon the power of one class to oppress another:

"Another point which is only partially covered in my testimony is in regard to what Chairman Walsh endeavored to get me and various other citizens to admit would be an infraction of free speech and personal liberty if the agitators were prevented from coming into Paterson or not permitted to hold their meetings here. The United States Government puts up the bars at Ellis Island against certain classes of 'undesirable citizens,' and as far as I have been able to learn the Government's action in debarring from this country the immoral and criminal class and those who would become a charge on the country meets with the approval of the Americans generally. If it is proper and right for the United States Government to say who shall and who shall not enter this country I think it is equally proper for the city of Paterson to debar undesirable citizens who are coming here to sow discontent and cause trouble in the city. New York City has had a dead line at Fulton Street for a great many years and the police authorities have prevented certain persons from crossing that line, and this has been considered a proper exercise of the police powers of the city. I can see no difference between this action on the part of the New York authorities and similar action which was desired by many of our citizens in Paterson in regard to the I. W. W. agitators."

injustice committed during this strike can be secured only by reading the testimony taken at Paterson and the reports of the commission's investigators based upon the records of the police and the courts.

In Los Angeles and Indianapolis essentially the same conditions were found by the commission, while in McKees Rocks, Bethlehem, and Westmoreland County, Pa., Lawrence, Mass., and Calumet, Mich., investigated by the Federal Department of Labor, essentially the same conditions of injustice were found to prevail. The conditions in West Virginia and Colorado, which were almost beyond belief and had the additional feature of military rule, will be discussed elsewhere.

An examination of the entire mass of evidence is convincing that such conditions are in fact typical of strikes which are serious enough to arouse the authorities, especially where the workers are unorganized before the strike and therefore lacking in influence in the community.

Tenth, it is asserted by the workers that in many localities during strikes not only is one of the greatest functions of the State, that of policing, virtually turned over to employers or arrogantly assumed by them, but criminals employed by detective agencies and strike-breaking agencies are clothed, by the process of deputization, with arbitrary power and relieved of criminal liability for their acts.

Only three such cases are cited here, though the commission has in its records evidence regarding a considerable number. At Roosevelt, N. J., it was found by the commission's investigators and later confirmed in court that the office of sheriff was virtually turned over to one Jerry O'Brien, the proprietor of a so-called detective agency; that he imported a number of men of bad reputation and clothed them with the authority of deputies; and that on January 19, 1915, these criminals, without provocation, wantonly shot and killed 2 men and wounded 17 others who were on strike against the American Agricultural Chemical Co., which paid and armed the deputies.

Similarly, during the Calumet, Mich., strike, about 230 men were imported from detective agencies in eastern cities, 52 under pay from the county board of supervisors, which was made up almost entirely of copper company officials. The actions of these men were so wantonly brutal that they were censured by the local judge, but they went unchecked in their career of arrogant brutality, which culminated in their shooting, without provocation, into a house in which women and children were, killing two persons and wounding two others.

The recent strike in Bayonne, N. J., threw more light on these armed guards. During this strike one of the New York detective agencies furnished for the protection of the Tidewater Oil Co.'s plant men who were so vicious and unreliable that the officials of the company themselves say that their presence was sufficient to incite a riot. These men shot without provocation at anyone or everyone who came within sight, and the killing of at least three strikers in Bayonne and the wounding of many more is directly chargeable to these guards.

The character of the men who make a specialty of this kind of employment has never been more frankly described than in the testimony of Mr. L. M. Bowers, chairman of the board of directors of

the Colorado Fuel & Iron Co., who repeatedly referred to those in the employ of that company as "cutthroats," against whose character, he stated, he had frequently protested.

According to the statement of Berghoff Bros. & Waddell, who style themselves "labor adjusters" and who do a business of strike breaking and strike policing, there are countless men who follow this business at all times. They say they can put 10,000 armed men into the field inside of 72 hours. The fact that these men may have a criminal record is no deterrent to their being employed, and no check can be made on the men sent out by these companies on hurry calls.

When the question of providing the bail for these men arose as a result of the killing of the strikers at Bayonne, the company attorney actually declined to furnish bail for them on the ground that they were thugs of whom the company knew nothing and that it would not be responsible for their appearance.

In view of the endless crimes¹ committed by the employees of the so-called detective agencies, who have been permitted to usurp a function that should belong only to the State, it is suggested that the commission recommend to Congress either that such of these agencies as may operate in more than one State, or may be employed by corporations engaged in interstate commerce, or may use the mails, shall be compelled to take out a Federal license, with regulations to insure the character of their employees and the limitation of their activities to the bona fide business of detecting crime, or that such agencies shall be utterly abolished through the operation of the taxing power or through denying them the use of the mails.

Eleventh. It is charged that in many localities the entire system of civil government is suspended during strikes and there is set up in its place a military despotism under so-called martial law.

In West Virginia, for example, during the strike of coal miners in 1912 martial law was declared and the writ of habeas corpus denied, in the face of a direct prohibition by the constitution of the State, in spite of the fact that the courts were open and unobstructed, and without reference to the protests of the strikers. Persons outside the military zone were arrested, dragged before military courts, tried and sentenced under so-called martial law. Upon appeal to the civil courts of the State the actions of the military authorities were upheld, in spite of the oath of the judges to support the constitution, which in terms provided "that no citizen, unless engaged in the military service of the State, shall be tried or punished by any military court for any offense that is cognizable by the civil courts of the State," and, further, "The privilege of the writ of habeas corpus shall not be suspended."

The decisions of the court stirred Hon. Edgar M. Cullen, a former chief judge of the Court of Appeals of New York—a witness before this commission and recognized as unusually conservative and careful in his utterances—to make the following statements:

Under these decisions the life and liberty of every man within the State would seem to be at the mercy of the governor. He may declare a state of war, whether the facts justify such a declaration or not, and that declaration is conclusive upon the courts.

¹ See the reports of congressional committees which investigated the Homestead strike, the Pullman strike, and the recent strikes in Colorado and West Virginia.

If he declares only a portion of the State to be in a state of war, under the decision in the second case a person in any other part of the State, however distant, may be arrested and delivered to the military authorities in the martial zone, and his fate, whether liberty or life, depends on the action of a military commission, for I know of no principle which authorizes a military commission to impose the punishment of imprisonment that would not equally authorize the imposition of the punishment of death. Under that doctrine, should armed resistance to the Federal authority justifying a suspension of the writ of habeas corpus occur in Arizona a citizen could, on a charge of aiding the insurrection, be dragged from his home in Maine and delivered to the military authorities in Arizona for trial and punishment.

The remedy suggested by the learned court, of impeachment by the legislature, would hardly seem of much efficacy. By impeachment the governor could only be removed from office. He could not be further punished, however flagrant his opposition may have been, except by a perversion of the criminal law, for if the doctrine of the courts is correct he would not have exceeded his legal power.

The governor might imprison or execute the members of the legislature, or even the learned judges of the supreme court themselves.¹

The attention of the commission has also been directed by witnesses to the repeated occurrence of similar or, if possible, more extreme conditions in Colorado and Idaho, which testimony has been confirmed either by the investigations and hearings of the commission or by the reports of responsible officials of the Federal Government. In Colorado martial law has been in effect ten times since 1894. Similarly in Idaho martial law has been in effect on several occasions. In both of these States not only have strikers been imprisoned by military courts, but thousands have been held for long periods in "bull pens," hundreds have been forcibly deported from the State, and so arrogant have the troops become upon occasions that they have refused to obey the mandates of the civil courts, although the constitutions of both States provide that the military shall always be in strict subordination to the civil power.² In fact, on one occasion at least, when orders of the court for the production of prisoners had been ignored and the military officers were summoned before the court, they surrounded the courthouse with infantry and cavalry, came into court accompanied by soldiers with fixed bayonets, and stationed a gatling gun in a position commanding the courthouse.² During the recent strike in Colorado the military was supreme and wielded its arbitrary power despotically and at times brutally.

Twelfth, it is charged by the workers that in some localities the control by the employers of the entire machinery of government is so great that lawless acts on the part of agents of the employers go unheeded and unpunished, while vindictive action against the leaders of the strike is accomplished by methods unparalleled in civilized countries. It is seldom that evidence sufficient to substantiate such sweeping charges can be secured, even if the charges are true; but in the testimony and documents which have been gathered by the commission there seems to be conclusive proof that in one State at least, Colorado, such a condition of complete domination of the State government has prevailed and, it would seem, does still prevail.

¹ Address before New York State Bar Association, 1914.

² Constitution of Colorado I, 33. Constitution of Idaho I, 12.

³ See report of U. S. Commissioner of Labor, Carroll D. Wright, on Labor Disturbances in Colorado for a detailed history of events up to and including 1904.

First, Hon. Frederick Farrar, attorney general of Colorado, testified in substance as follows:

As a result of a personal investigation into conditions in Las Animas and Huerfano Counties, Colo., in the summer of 1913, a very perfect political machine was found to exist. The head of this political machine is the sheriff, and it is conducted along lines very similar to those maintained by corrupt political organizations. It has a system of relief in case of need, and a system of giving rewards to its people. It was difficult to determine which was cause and which effect, but there was undoubtedly some relationship between the political machine and the coal companies. Witness believes the machine existed through its power as a machine over the coal companies, but has no knowledge of any money being used. His investigation did not lead into question of whether the machine controlled coroners' juries in cases of death from accidents in mines, etc., or of whether mining laws were obeyed.

Second, Hon. Thomas M. Patterson, formerly United States Senator, testified:

The men employed by the large mining companies have been used to gain political power. There is no doubt that it is the deliberate purpose of these companies to control the officials of the counties in which they are operating, and to have a great influence in the selection of judges and in the constitution of the courts. In this purpose they have been successful. Election returns from the two or three counties in which the large companies operate show that in the precincts in which the mining camps are located the returns are nearly unanimous in favor of the men or measures approved by the companies, regardless of party. The companies know whom they want elected, and do not hesitate, judging from the results, to make it known.

Third, State Senator Helen Ring Robinson testified in substance as follows:

As a member of the committee of privileges and elections, which investigated conditions in Las Animas County, she listened for three weeks to the story of political conditions there. Long before the strike was ordered she realized that the industrial situation was hopeless because the political situation appeared hopeless.

"I found that while the counties of Las Animas and Huerfano are geographically a part of Colorado, yet industrially and politically they are a barony or a principality of the Colorado Fuel & Iron Co. Such situations, of course, must mean a knitting together of the industrial and political situation, and I don't wish to say that the Colorado Fuel & Iron Co. have limited their efforts to Las Animas and Huerfano Counties. If that were so, the situation in the State itself would not be so seriously affected by them; but they have in time past reached out beyond the boundaries of their principality and made and unmade governors; men who desire positions of high place in Colorado would be very loath to antagonize them whether they lived in Las Animas or Routt County, or in Denver, and it would not matter in that case to which political party they belonged."

Attention should be called to another aspect of the control of the machinery of government by one class for the oppression of another. The scales of justice have in the past swung far in one direction—legislatures, courts, and administrative officers under the domination of corporations have grievously wronged the workers. There is grave danger that, if the workers assert their collective power and secure the control of government by the massing of their numbers, the scales may swing equally far in the other direction and every act of injustice, every drop of blood, every moment of anguish, be repaid in full, not upon some obscure and humble worker, but upon those who now glory in the sense of boundless power and security.

In the few cases in which the workers have momentarily secured control of local situations, they have followed the examples that

have been set and have in many instances used their power unjustly and oppressively. In Colorado, for example, during the strikes in the metal mines, where the Western Federation of Miners controlled a camp, they followed the example of the operators and deported persons whom they deemed to be obnoxious. Similarly, during the fight between two factions of the Western Federation of Miners in Butte, Mont., the dominant faction forced several persons to leave the city and set aside the ordinary processes of law. It is inevitable that this should be the case, and it is remarkable only that the masses of workers, even when acting as mobs, show greater self-restraint than do organizations made up of business men ordinarily regarded as upright, respectable, and admirable citizens.

For the security and honor of the Nation the scales of justice must be brought to a stable equilibrium. This can be accomplished only by a realization by every citizen that every act of injustice, whether done in far-off States or at one's very door, whether affecting a friend or an enemy, is in its consequences an invasion of one's own security and a menace to one's liberty.

There is reason, however, to expect that no sober and well-considered action for the removal of these abuses will be taken, and one may, without being an alarmist, share the fears expressed by Judge Seymour D. Thompson:¹

The dangerous tendencies and extravagant pretensions of the courts which I have pointed out ought not to be minimized, but ought to be resisted. Their resistance ought not to take place as advised by Jefferson, by "meeting the invaders foot to foot," but it ought to take place under the wise and moderate guidance of the legal profession, but the danger is that the people do not always so act. In popular governments evils are often borne with stolid patience until a culminating point is reached, when the people burst into sudden frenzy and redress their grievances by violent and extreme measures, and even tear down the fabric of government itself. There is danger, real danger, that the people will see at one sweeping glance that all the powers of their Government, Federal and State, lie at the feet of us lawyers, that is to say, at the feet of a judicial oligarchy; that those powers are being steadily exercised in behalf of the wealthy and powerful classes, and to the prejudice of the scattered and segregated people; that the power thus seized includes the power of amending the Constitution; the power of superintending the action, not merely of Congress, but also of the State legislatures; the power of degrading the powers of the two Houses of Congress, in making those investigations which they may deem accessory to wise legislation, to the powers which an English court has ascribed to British colonial legislatures; * * * holding that a venal legislature, temporarily vested with power, may corruptly bargain away those essential attributes of sovereignty and for all time; that corporate franchises bought from corrupt legislatures are sanctified and placed forever beyond recall by the people; that great trusts and combinations may place their yokes upon the necks of the people of the United States, who must groan forever under the weight, without remedy and without hope; that trial by jury and the ordinary criminal justice of the States, which ought to be kept near the people, are to be set aside, and Federal court injunctions substituted therefor; that those injunctions extend to preventing laboring men quitting their employment, although they are liable to be discharged by their employers at any time, thus creating and perpetuating a state of slavery. There is danger that the people will see these things all at once; see their enrobed judges doing their thinking on the side of the rich and powerful; see them look with solemn cynicism upon the sufferings of the masses, nor heed the earthquake when it begins to rock beneath their feet; see them present a spectacle not unlike that of Nero fiddling while Rome burns. There is danger that the people will see all this at one sudden glance, and that the furies will then break loose and that all hell will ride on their wings.

¹ Address before State Bar Association of Texas, 1896.

It is true that Judge Thompson spoke 19 years ago, but the real danger lies in the fact that during that period we have done little to remove the evils cited by him, and that there is even reason to fear that we have simply moved nearer to the danger line instead of away from it.

In considering the action which needs to be taken it has been urged by some that the end to be achieved is to place personal rights on a parity with property rights. It is necessary to render a firm protest and warning against the acceptance of such an ideal. The establishment of property rights and personal rights on the same level can leave only a constant and ever-growing menace to our popular institutions. With the acceptance of such an ideal our democracy is doomed to ultimate destruction. Personal rights must be recognized as supreme and of unalterable ascendancy over property rights.

Relief from these grave evils can not be secured by petty reforms. The action must be drastic and directed at the roots from which these evils spring.

With full recognition of the gravity of the suggestions, it seems necessary to urge the commission to make the following recommendations:

1. That Congress forthwith initiate an amendment to the Constitution providing in specific terms for the protection of the personal rights of every person in the United States from encroachment by the Federal and State Governments and by private individuals, associations, and corporations. The principal rights which should be thus specifically protected by the power of the Federal Government are the privilege of the writ of habeas corpus, the right to jury trial, to free speech, to peaceful assemblage, to keep and bear arms, to be free from unreasonable searches and seizures, to speedy public trial, and to freedom from excessive bail and from cruel and unusual punishments.

2. That Congress immediately enact a statute or, if deemed necessary, initiate a constitutional amendment, specifically prohibiting the courts from declaring legislative acts unconstitutional.

3. That Congress enact that in all Federal cases where the trial is by jury, all qualified voters in the district shall be included in the list from which jurors are selected, and that they shall be drawn by the use of a wheel or other device designed to promote absolute impartiality.

4. That Congress drastically regulate or prohibit private detective agencies doing business in more than one State, employed by a company doing an interstate business, or using the mails in connection with their business. Such regulation, if it is feasible, should include particularly the limitation of their activities to the bona fide functions of detecting crime, and adequate provision should be made for the rigid supervision of their organization and personnel.

4. DENIAL OF THE RIGHT OF ORGANIZATION.

The previous discussion of the causes of industrial unrest has dealt with the denial of certain fundamentals to which the workers believe they have natural and inalienable rights, namely, a fair distribution of the products of industry, the opportunity to earn a living, free access to unused land and natural resources, and just treatment by

legislators, courts, and executive officials. A more serious and fundamental charge is, however, contained in the allegation by the workers that in spite of the nominal legal right which has been established by a century-long struggle, almost insurmountable obstacles are placed in the way of their using the only means by which economic and political justice can be secured, namely, combined action through voluntary organization. The workers insist that this right of organization is fundamental and necessary for their freedom, and that it is inherent in the general rights guaranteed every citizen of a democracy. They insist that "people can free themselves from oppression only by organized force. No people could gain or maintain their rights or liberties acting singly, and any class of citizens in the State subject to unjust burdens or oppression can gain relief only by combined action."

The demand for organization and collective action has been misunderstood, it is claimed, because of the belief among a large number of citizens that its purpose was simply to secure better wages and better physical conditions. It has been urged, however, by a large number of witnesses before the commission that this is a complete misconception of the purposes for which workers desire to form organizations. It has been pointed out with great force and logic that the struggle of labor for organization is not merely an attempt to secure an increased measure of the material comforts of life, but is a part of the age-long struggle for liberty; that this struggle is sharpened by the pinch of hunger and the exhaustion of body and mind by long hours and improper working conditions; but that even if men were well fed they would still struggle to be free. It is not denied that the exceptional individual can secure an economic sufficiency either by the sale of his unusual ability or talent or by sycophantic subservience to some person in authority, but it is insisted that no individual can achieve freedom by his own efforts. Similarly, while it is admitted that in some cases exceptional employers treat their employees with the greatest justice and liberality, it is held to be a social axiom that no group of workers can become free except by combined action, nor can the mass hope to achieve any material advance in their condition except by collective effort.

Furthermore, it is urged by the representatives of labor that the efforts of individuals who are bent upon bettering their own condition without reference to their health or to the interests of others directly injure each of their fellow workers and indirectly weaken the whole fabric of society.

It is also pointed out that the evolution of modern industry has greatly increased the necessity for organization on the part of wage earners. While it is not admitted that the employer who has only one employee is on an economic equality with the person who is employed by him, because of the fact that the employer controls the means of livelihood, which gives him an almost incalculable advantage in any bargain, nevertheless this condition of inequality is held to have been enormously increased by the development of corporations controlling the livelihood of hundreds of thousands of employees and by the growth of employers' associations whose members act as a unit in questions affecting their relations with employees.

There have been many able and convincing expositions of this belief by witnesses before the commission, but there is no other which

seems to have so completely covered the entire field as the testimony of Mr. Louis D. Brandeis, who, as he stated, has studied this problem from the standpoint both of employers and of employees:

My observation leads me to believe that while there are many single things—single causes—contributing causes to unrest, that there is one cause which is fundamental, and it is the necessary conflict between—the contrast between—our political liberty and the industrial absolutism.

We are as free politically, perhaps, as it is possible for us to be. Every man has his voice and his vote, and the law has endeavored to enable, and has succeeded practically in enabling, him to exercise his political franchise without fear. He, therefore, has his part, and he certainly can secure an adequate part of the government of the country in all of its political relations—in all relations which are determined by legislation or governmental administration. On the other hand, in dealing with industrial problems the position of the ordinary worker is exactly the reverse. And the main objection, as I see it, to the large corporation is that it makes possible—and in many cases makes inevitable—the exercise of industrial absolutism. It is not merely the case of the individual worker against employer, which, even if he is a reasonably sized employer, presents a serious situation calling for the interposition of a union to protect the individual. But we have the situation of an employer so potent, so well organized, with such concentrated forces and with such extraordinary powers of reserve and the ability to endure against strikes and other efforts of a union, that the relatively loosely organized masses of even strong unions are unable to cope with the situation.

We are dealing here with a question not of motive, but of condition. Now, the large corporations and the managers of the large corporations—of the powerful corporations—are probably, in a large part, actuated by motives just the same as an employer of one-tenth of their size. Neither of them, as a rule, wishes to have his liberty abridged; but the smaller concern usually comes to the conclusion that it is necessary that it should be where there is an important union found. But when you have created a great power, when there exist these powerful organizations who can afford—not only can successfully summon forces from all parts of the country—to use tremendous amounts of money in any conflict to carry out what they deem to be their business principles, you have necessarily a condition of inequality between the two contending forces. The result is that contests, doubtless undertaken with the best of motives and with strong convictions of what is for the best interests not only of the company but of the community, leads to absolutism. In all cases of these large corporations the result has been to develop a benevolent absolutism—an absolutism all the same; and it is that which makes the great corporation so dangerous. It is because you have created within the State a state so powerful that the ordinary forces existing are insufficient to meet it.

Now, to my mind the situation of the worker that is involved—and I noted, Mr. Chairman, that when you put the question you put the question of physical condition—unrest, in my mind, never can be removed, and, fortunately never can be removed by the mere improvement of the physical and material conditions of the working man. If it were we should run great risk of improving their material conditions and reducing their manhood. We must bear in mind all the time that however much we may desire material improvement and must desire it for the comfort of the individual, we are a democracy; and that we must have above all things men; and it is the development of manhood to which any industrial and social system must be directed. We are committed not only to social justice in the sense of avoiding things which bring suffering and harm and unequal distribution of wealth, but we are committed primarily to democracy, and the social justice to which we are headed is an incident of our democracy, not an end itself. It is the result of democracy, but democracy we must have. And, therefore, the end to which we must move is a recognition of industrial democracy as the end to which we are to work, and that means this: It means that the problems are not any longer, or to be any longer, the problems of the employer. The problems of his business—it is not the employer's business. The union can not shift upon the employer the responsibility for the conditions, nor can the employer insist upon solving, according to his will, the conditions which shall exist; but the problems which exist are the problems of the trade; they are the problems of the employer and the employee. No possible degree of profit sharing, however liberal, can meet

the situation. That would be again merely dividing the proceeds of business. That might do harm or it might do good, dependent on how it is applied.

No mere liberality in the division of the proceeds of industry can meet this situation. There must be a division not only of the profits, but a division of the responsibilities; and the men must have the opportunity of deciding, in part, what shall be their condition and how the business shall be run. They also, as a part of that responsibility, must learn that they must bear the results, the fatal results, of grave mistakes, just as the employer. But the right to assist in producing the results, the right, if need be, the privilege of making mistakes, is a privilege which can not be denied to labor, just as we must insist on their sharing the responsibilities for the result of the business.

Now, to a certain extent we get that result—are gradually getting it—in smaller businesses. The grave objection to the large business is that almost inevitably, from its organization, through its absentee stockholdership, through its remote directorship, through the creation practically of stewards to take charge of the details of the operation of the business and coming into direct relation with labor, we lose that necessary cooperation which our own aspirations—American aspirations—of democracy demand. And it is in that, in my opinion, that we will find the very foundation of the unrest; and no matter what is done with the superstructure, no matter how it may be improved one way or the other, unless we reach that fundamental difficulty, the unrest will not only continue, but in my opinion will grow worse.

It is very significant that out of 230 representatives of the interests of employers, chosen largely on the recommendations of their own organizations, less than half a dozen have denied the propriety of collective action on the part of employees. A considerable number of these witnesses have, however, testified that they denied in practice what they admitted to be right in theory. A majority of such witnesses were employers who in the operation of their business maintained what they, in accordance with common terminology, called the "open shop." The theory of the "open shop," according to these witnesses, is that workers are employed without any reference to their membership or nonmembership in trade unions; while, as a matter of fact, it was found upon investigation that these employers did not, as a rule, willingly or knowingly employ union men. Nevertheless, this is deemed by the commission to be a minor point. The "open shop," even if union men are not discriminated against, is as much a denial of the right of collective action as is the "antiunion shop." In neither is the collective action of employees permitted for the purpose of negotiating with reference to labor conditions. Both in theory and in practice, in the absence of legislative regulation, the working conditions are fixed by the employer.

It is evident, therefore, that there can be at best only a benevolent despotism where collective action on the part of the employees does not exist.

A great deal of testimony has been introduced to show that employers who refuse to deal collectively with their workmen do in fact grant audiences at which the grievances of their workmen may be presented. One is repelled rather than impressed by the insistence with which this idea has been presented. Every tyrant in history has on stated days granted audiences to which his faithful subjects might bring their complaints against his officers and agents. At these audiences, in theory at least, even the poorest widow might be heard by her sovereign in her search for justice. That justice was never secured under such conditions, except at the whim of the tyrant, is sure. It is equally sure that in industry justice can never be attained by such a method.

The last point which needs to be considered in this connection is the attitude frequently assumed by employers that they are perfectly willing to deal with their own employees collectively, but will resist to the end dealing with any national organization, and resent the intrusion of any persons acting for their employees who are not members of their own labor force. In practice these statements have been generally found to be specious. Such employers as a rule oppose any effective form of organization among their own employees as bitterly as they fight the national unions. The underlying motive of such statements seems to be that as long as organizations are unsupported from outside they are ineffective and capable of being crushed with ease and impunity by discharging the ringleaders. Similarly, the opposition to the representation of their employees by persons outside their labor force seems to arise wholly from the knowledge that as long as the workers' representatives are on the pay roll they can be controlled, or, if they prove intractable they can be effectually disposed of by summary dismissal.

To suggest that labor unions can be effective if organized on less than a national scale seems to ignore entirely the facts and trend of present-day American business. There is no line of organized industry in which individual establishments can act independently. Ignoring for the time the centralization of control and ownership, and also the almost universal existence of employers' associations, the mere fact of competition would render totally ineffective any organization of employees which was limited to a single establishment. Advance in labor conditions must proceed with a fair degree of uniformity throughout any line of industry. This does not indeed require that all employees in an industry must belong to a national organization, for experience has shown that wherever even a considerable part are union members, the advances which they secure are almost invariably granted by competitors, even if they do not employ union men, in order to prevent their own employees from organizing.

The conclusions upon this question, however, are not based upon theory, but upon a thorough investigation of typical situations in which the contrast between organization and the denial of the right of organization could best be studied. The commission has held public hearings and has made thorough investigations in such industrial communities as Paterson, N. J., Los Angeles, Cal., Lead, S. Dak., and Colorado, where the right of collective action on the part of employees is denied. These investigations have shown that under the best possible conditions, and granting the most excellent motives on the part of employers, freedom does not exist either politically, industrially, or socially, and that the fiber of manhood will inevitably be destroyed by the continuance of the existing situation. Investigations have proved that although the physical and material conditions may be unusually good, as, for example, in Lead, S. Dak., they are the price paid for the absolute submission of the employees to the will of the employing corporation. Such conditions are, moreover, shown by the hearings of the commission and by the investigations of its staff to be unusual. Los Angeles, for example, although exceptionally endowed in location, climate, and natural resources, was sharply criticized for the labor conditions

which had developed during its "open shop" régime even by Mr. Walter Drew, representing several of the largest associations which contend for the "open shop." It is significant that the only claim ordinarily made for the conditions in such establishments or localities is that "they are as good as are secured by the union." As a matter of fact, there are few establishments which make this boast, and in the majority the conditions were found to be far below any acceptable standards.

The commission has also, through public hearings and the investigations of its staff, made a thorough and searching investigation of the conditions in those industries and establishments where collective action, through the medium of trade unions and joint agreements, exists. It has not been found that the conditions in such industries are ideal, nor that friction between employers and the unions is unknown; nor has it been found that the employees in such industries have entirely achieved economic, political, and industrial freedom, for these ideals can not be gained until the fundamental changes in our political and economic structure, which have already been referred to, have in some way been accomplished. It has been found, however, that the material conditions of the workers in such industries and establishments are on a generally higher plane than where workers are unorganized; that important improvements in such conditions have been achieved as the direct result of organization; that the friction which exists in such industries and establishments has been reduced rather than increased by organization; and that the workers at least have secured a basis upon which their political and economic freedom may ultimately be established.

The evils of graft, "machine politics," factional fights, and false leadership, which have been found sometimes to exist in such organized industries, are those which are inevitable in any democratic form of organization. They are the same evils which have accompanied the development of the American Nation, and of its States and municipalities. Such evils as we have found to exist are indeed to be condemned, but a study of the history of these organizations seems to show clearly that there is a tendency to eradicate them as the organizations become stronger and as the membership becomes more familiar with the responsibilities and methods of democratic action. Furthermore, there is a fundamental principle which applies in this field as in all other lines of human activity. This principle is contained in the following contrast: In democratic organizations such evils and excesses as may arise tend to disrupt and destroy the organization and are therefore self-eradicating; while in an autocracy, evils and excesses tend inevitably to strengthen the existing autocrat and can be eradicated only in the event of a revolt on the part of those who suffer from such evils. This is the history not only of every form of artificial association, but of nations.

The fundamental question for the Nation to decide, for in the end public opinion will control here as elsewhere, is whether the workers shall have an effective means of adjusting their grievances, improving their condition, and securing their liberty, through negotiation with their employers, or whether they shall be driven by necessity and oppression to the extreme of revolt. Where men are well organized, and the power of employers and employees is fairly well balanced, agreements are nearly always reached by negotiation; but,

even if this fails, the strikes or lockouts which follow are as a rule merely cessations of work until economic necessity forces the parties together again to adopt some form of compromise. With the unorganized there is no hope of achieving anything except by spontaneous revolt. Too often has it been found that during the delay of attempted negotiations the leaders are discharged and new men are found ready to take the place of those who protest against conditions. Without strike funds or other financial support the unorganized must achieve results at once; they can not afford to wait for reason and compromise to come into play. Lacking strong leaders and definite organization, such revolts can only be expected to change to mob action on the slightest provocation.

Looking back over the industrial history of the last quarter century, the industrial disputes which have attracted the attention of the country and which have been accompanied by bloodshed and violence have been revolutions against industrial oppression, and not mere strikes for the improvement of working conditions. Such revolutions in fact were the railway strikes of the late eighties, the Homestead strike, the bituminous coal strike of 1897, the anthracite strikes of 1900 and 1903, the strike at McKees Rocks in 1909, the Bethlehem strike of 1910, the strikes in the textile mills at Lawrence, Paterson, and Little Falls, many of the strikes in the mining camps of Idaho and Colorado, the garment workers' strikes in New York and other cities, and the recent strikes in the mining districts of West Virginia, Westmoreland County, Pa., and Calumet, Mich.

As a result, therefore, not only of fundamental considerations but of practical investigations, the results of which are described in detail hereinafter, it would appear that every means should be used to extend and strengthen organizations throughout the entire industrial field. Much attention has been devoted to the means by which this can best be accomplished, and a large number of suggestions have been received. As a result of careful consideration, it is suggested that the commission recommend the following action:

1. Incorporation among the rights guaranteed by the Constitution of the unlimited right of individuals to form associations, not for the sake of profit but for the advancement of their individual and collective interests.

2. Enactment of statutes specifically protecting this right and prohibiting the discharge of any person because of his membership in a labor organization.

3. Enactment of a statute providing that action on the part of an association of individuals not organized for profit shall not be held to be unlawful where such action would not be unlawful in the case of an individual.

4. That the Federal Trade Commission be specifically empowered and directed by Congress, in determining unfair methods of competition to take into account and specially investigate the unfair treatment of labor in all respects, with particular reference to the following points:

- (a) Refusal to permit employees to become members of labor organizations.

- (b) Refusal to meet or confer with the authorized representatives of employees.

5. That the Department of Labor, through the Secretary of Labor or any other authorized official, be empowered and directed to present to the Federal Trade Commission, and to prosecute before that body all cases of unfair competition arising out of the treatment of labor which may come to its attention.

6. That such cases, affecting as they do the lives of citizens in the humblest circumstances, as well as the profits of competitors and the peace of the community, be directed by Congress to have precedence over all other cases before the Federal Trade Commission.

CONCLUSIONS AND RECOMMENDATIONS.

The remainder of the report is devoted largely to the conclusions and recommendations with respect to specific questions propounded by Congress. The facts upon which these conclusions and recommendations are based are contained in the testimony taken by the commission and in the reports of its investigators. The complete corrected testimony is transmitted to Congress, as well as a carefully prepared digest of the evidence. The reports of the investigators have likewise been placed in the possession of Congress.¹

I. INDUSTRIAL CONDITIONS OF ADULT WORKMEN IN GENERAL INDUSTRIES.

In this section only the conditions of adult workmen are considered, leaving the questions affecting women and children for separate consideration later. The problems involved are essentially different, and the position of women and children in relation to the State may be clearly distinguished from the position of adult workmen.

WAGES.

As a result of the investigations which have been made the following conclusions are justified:

1. The welfare of the State demands that the useful labor of every able-bodied workman should, as a minimum, be compensated by sufficient income to support in comfort himself, a wife, and at least three minor children, and in addition to provide for sickness, old age, and disability. Under no other conditions can a strong, contented, and efficient citizenship be developed.

2. Under existing conditions such an income is not received by fully one-half of the wage earners employed in industry.

3. The natural resources of the United States are such that an industrial population properly educated and efficiently organized can produce enough to achieve this standard of living.

4. It is probable that even at present the national agricultural and industrial output is sufficient to permit the establishment of such a standard.

5. The problem is therefore essentially one of distribution.

6. The fixing of the wages of adult workmen by legal enactment is not practicable nor desirable as a general policy, except for public employees.

7. A just standard of wages in any industry or occupation can best be reached by collective bargaining between employers and employees

¹ These reports have not been printed with this document, on the recommendation of Chairman Frank P. Walsh, as stated in his letter in Senate Report No. 143, Sixty-fourth Congress.

for the purpose of forming voluntary joint agreements. The success and justice of such joint agreements is, however, dependent upon the essential equality of the two parties and can not be attained unless effective organization exists.

It is suggested that the commission make the following recommendations:

1. In order that the public may be kept fully informed with regard to labor conditions, and that a proper basis of facts should exist for negotiation and arbitration, the Federal Government should enact the necessary legislation to provide for the collection, through the Bureau of Labor Statistics or otherwise, of the full and exact facts regarding wages, hours of labor, and extent of unemployment for every industry. Every employer should be required by law to file with the proper authority a sworn statement of these facts according to a prescribed form. These statistics should be published annually, and the full data regarding any industry or plant should be accessible to any mediator or any other responsible citizen.

2. Uniform statutes should be passed by the legislatures of all States requiring that wages be paid at least semimonthly and in cash, except where by joint agreement other methods are agreed upon.

HOURS OF LABOR.

As a result of investigation the following conclusions are justified:

1. The physical well-being, mental development, and recreational needs of every class of population demand that under normal circumstances the working day should not exceed eight hours.

2. A very large percentage of the workmen in manufactures, transportation, and mining work more than eight hours per day.

3. This is in marked contrast to the condition of those whose economic position enables them to define the length of their own working day.

4. Practical experience has shown that the reduction of working hours is in the interest not only of the worker and the community generally, but of the employer.

5. The regulation by legal enactment of working hours of adult workmen is not generally practicable nor desirable, except for public employees.

It is suggested that the commission recommend:

1. That in the so-called continuous occupations, other than the movement of trains, requiring work during both the day and the night for six or seven days per week, the State and Federal Governments should directly intervene, so that the working hours should not exceed eight per day nor extend to more than six days per week.

SAFETY AND SANITATION.

The investigations which have been made warrant the following conclusions:

1. Great progress has been made during recent years in promoting safety and sanitation in manufacturing, mining, and transportation.

2. The progress has been most rapid in the direction of safeguarding workers from industrial accidents.

3. Progress in safety has been in part the result of continued agitation and education, but has proceeded most rapidly and satisfactorily since the enactment of workmen's compensation laws, which render unsafe working conditions expensive to the employer.

4. The movement has also been largely promoted by the formation of safety committees composed of officials and workmen, and by the creation of joint conferences of employers and employees to assist and advise State officials in the administration of the law and in the formulation of safety rules.

5. The campaign for safety needs, however, to be greatly extended as rapidly as possible. The annual list of accidents, approximately 35,000 fatalities and 700,000 injuries involving disability of over four weeks, can not be regarded complacently. From one-third to one-half of these accidents have been estimated by competent authorities to be preventable by proper safeguards, inspection, and control.

6. The advance in the sanitation of workshops has been less rapid, because not only are the dangers less obvious, but there is no financial liability for diseases or deaths occurring as the result of improper sanitation. Future progress in sanitation demands attention not only to cleanliness and ventilation but to occupational diseases.

7. The most direct incentive for the promotion of sanitation would be the adoption of a proper system of sickness insurance.

It is suggested that the commission recommend:

1. The creation of a bureau of industrial safety (except that the section providing a museum of safety is not indorsed). Proper steps should be taken to provide for the coordination of the work of all Federal bureaus whose work is concerned with industrial safety.

2. The appropriations of the Public Health Service for the investigation and promotion of industrial sanitation should be increased.

HOUSING.

It has been found in the course of the commission's investigations:

1. The present provisions for the housing of workmen are generally bad, not only in the large cities but in industrial communities of every size and in rural districts.

2. Not only are the houses and tenements which are available for workers largely insanitary and unfit for habitation but they are inadequate, resulting in high rents, overcrowding, and congestion.

3. Such conditions make not only for discomfort and unhappiness, but for disease and degeneration.

4. The ordinary method of supplying houses through their erection by private capitalists for investment and speculation has rarely, if ever, been adequate.

5. Excellent plans for the housing of workmen have been put into effect by a number of firms and corporations, but such measures have not at all affected the general situation, and being dependent upon the volition of individuals can not be regarded as likely to greatly influence progress.

6. The tenement-house acts, as well as the health ordinances and building regulations of municipalities, while generally productive of good effects, are at best surface remedies and can never cure the evils of the present housing situation.

7. In every important European country Government aid and direct intervention to curb speculation have proved to be necessary for the promotion of any real progress.

8. Governmental action in Europe has chiefly taken the following forms:

(a) Extension of credit to voluntary nonprofit-making associations.

(b) Construction by the Government of buildings which are leased for long periods on easy terms.

(c) Exemption from taxation and other subsidies for homes constructed for occupancy by their owners.

(d) Legislation designed to prevent the holding of land out of use and to secure for the Government a part of the "unearned increment."

It is suggested that the commission recommend:

1. The Federal and State Governments should institute investigations directed not so much to ascertaining existing housing conditions as to formulating constructive methods by which direct support and encouragement to the promotion of improved housing can be given. Actual experiment in the promotion of housing should proceed as rapidly as proper plans can be drafted.

2. Special attention should be given to taxation, in order that land should as far as possible be forced into use and the burden of taxation be removed from home owners.

3. The municipalities should be relieved from all State restrictions which now prevent them from undertaking the operation of adequate housing schemes and from engaging in other necessary municipal enterprises.

II. WOMEN AND CHILDREN IN INDUSTRY.

The investigations and hearings of the commission justify the conclusions:

1. As a result of their unprotected condition, women and children are exploited in industry, trade, domestic service, and agriculture to an extent which threatens their health and welfare and menaces the well-being of future generations.

2. The competition of women and children is a direct menace to the wage and salary standards of men.

3. Under present conditions, children are permitted by their parents to go to work largely because their earnings are necessary for the support of the rest of the family. The restrictive legislation of the past quarter century, although admirable in purpose and ultimate results, has thrown a heavy burden upon the fathers and mothers, who, at existing wages, have been barely able to support their families. The evidence shows that the burden of child-labor legislation has rested upon the wage earners rather than upon employers. It is the testimony of enlightened employers that the employment of children is unprofitable, and that the effect of excluding children from factories has been to increase rather than decrease profits. In the interests of society as a whole, further restrictions on the employment of immature children are necessary, but it is important that they should be made with an understanding that the burden will rest primarily upon the wage earners, whose self-sacrifice should be fully recognized.

4. The increasing employment of women has been due to two primary causes: First, the low wages of men, which have made the earnings of women necessary for the support of the family, and, second, the inducement to employers to substitute women for men because they will accept lower wages and are less likely to protest against conditions. The substitution of women for men has been greatly assisted by the introduction of improved machinery, which makes strength and technical skill unnecessary.

5. The increased employment of women under present working conditions is a serious menace to their own health and well-being, to the wages of their husbands and brothers, and to the ideals of family life upon which American civilization has been established.

6. The conditions under which women are employed in domestic service and in agriculture merit the attention of the Nation no less than does their employment in manufacturing and trade. Not only is the economic condition of women employed in agriculture and domestic service a matter of grave concern, but they are subject to overwork, unreasonable hours, and personal abuse of various kinds, from which they have been largely relieved in factories and stores through agitation and legislation.

7. The position of women in industry has been rendered doubly hard by reason of their lack of training for industrial work, by the oversupply of such labor and the consequent competition, by their traditional position of dependence, and by their disfranchisement.

8. A very thorough investigation in the New England States failed to show a single manufacturer who had left a State as a result of restrictive factory legislation. On the contrary, the majority of manufacturers expressed the opinion that the legislation regulating conditions for women and children had been advantageous to the industry as a whole, particularly because it placed all competitors upon the same footing. Similarly an investigation of the effects of minimum-wage legislation failed to show any calculable effects upon the cost of production or upon the employment of women after a sufficient period had elapsed to allow the necessary readjustments to be made.

9. Nevertheless, there is a strong and increasing demand on the part of manufacturers in the more progressive States that regulation of factory conditions should be undertaken by the Federal Government, in order that competitors in all parts of the country should be placed upon an equal footing in this respect. The same demand comes also from the representatives of labor not only because the argument of "interstate competition" is creating strong opposition to progressive legislation, but because of the great economy of effort which would result from having to make the fight for better legislation only at the National Capital instead of in 45 States.

It is suggested that the commission recommend:

1. The recognition both by public opinion and in such legislation as may be enacted of the principle that women should receive the same compensation as men for the same terms.

2. Until this principle is recognized and women are accorded equal political rights, the extension of State protection of women, through legislation regulating working conditions, hours of service, and minimum wages, is highly desirable.

3. The increased organization of working women for self-protection and the improvement of their industrial conditions.

4. The inclusion of all women working for wages, whether in industry, trade, domestic service, or agriculture, under future legislation regulating their wages, hours, or working conditions.

5. The extension of the principle of State protection of children and the rapid increase of facilities for their education as outlined elsewhere.

6. The enactment by Congress of legislation embodying the principles contained in the so-called Palmer-Owen bill, which was before Congress at the last session.

III. INDUSTRIAL CONDITIONS AND RELATIONS ON PUBLIC UTILITIES.

GENERAL.

The investigations of the commission show:

1. The scope of the Newlands Act, which applies only to employees engaged in the operation of interstate railroads, is too narrow and leaves the public service in the transmission of intelligence and in the handling of interstate commerce likely to be interrupted by labor disputes without any adequate legal provision either for mediation and conciliation or for making the facts involved in the dispute known to the public.

2. Even as applied to train-service employees, the Newlands Act provides no means of bringing the facts before the public, except when both sides agree to arbitration.

3. The selection of impartial members of arbitration boards has almost without exception devolved upon the Board of Mediation and Conciliation, owing to the inability of the parties to agree. This not only imposes an unpleasant and burdensome task upon the Board of Mediation and Conciliation, but tends greatly to weaken its influence. The experience in Great Britain shows that agreement can be reached by joint conference of employers and employees during a period of industrial peace for the selection of a panel of impartial persons from which arbitrators can be selected when they are needed, and seems to indicate that in the United States the inability of the parties to agree upon impartial arbitrators is due in part at least to the fact that they are always selected during the heat of the conflict.

It is suggested that the commission recommend:

1. The extension of the Newlands Act to cover not only all classes of railroad employees, but all employees of public-service corporations which are engaged in interstate commerce.

2. The functions of the Board of Mediation and Conciliation under the Newlands Act should be extended to provide for the creation of boards of investigation, to be formed only by consent of both parties and to make a report of facts and recommendations which will not be binding upon either side.

3. The Board of Mediation and Conciliation should be authorized by Congress to create an advisory council, composed of equal numbers of employers and employees, for the purpose of creating a panel of names from which impartial arbitrators may be chosen by the Board of Mediation and Conciliation.

TELEGRAPH.

The investigations and hearings of the commission justify the following conclusions:

1. The workers employed by the two principal telegraph companies (the Western Union Telegraph and the Postal Telegraph-Cable) are not only underpaid, as admitted by the highest officials in their testimony before the commission, but subject to many abuses, such as the denial of proper periods of relief while on duty; the establishment of arbitrary speed rates, which frequently result in overstrain; the arbitrary discharge of employees without notice for any cause or no cause; the employment of young boys for messenger service under conditions which can result only in their moral corruption; and the employment of women for telegraph service at night.

2. Such conditions have existed practically without change at least since 1884, in spite of the facts having been made public by three Government investigations.

3. The workers are practically unable to improve their condition because these two companies, which control practically the entire industry, deny them the right of organization. The suppression of organization is effectively carried out by the discharge of all known to be union men or union sympathizers, by the use of spies who fraudulently secure the confidence of employees and report all known to be union members or sympathizers, by the use of an effective system of blacklisting, and by the control even of the personnel of the operators upon leased wires in the offices of brokers and other private individuals.

4. The two companies have a monopoly of the transmission of telegrams, and no effective competition exists between them. These companies are performing a service in the transmission of intelligence which has been held by the Federal Supreme Court to have been reserved by the Constitution specifically to the Federal Government.

5. The telegraph companies are enormously overcapitalized, and their rates, which are graded to pay dividends upon large amounts of stock which do not represent the investment of cash, are very much higher than the cost of service warrants.

6. Owing to the duplication of offices on the part of the two companies and the maintenance of branch offices which are idle for a large part of the time, this service is being performed inefficiently and at an unusually high cost in spite of the low wages paid the operators.

It is suggested that the commission recommend:

1. The property of the telegraph companies or such part of their equipment as may be necessary for the efficient operation of a national telegraph system should be purchased by the Federal Government after proper valuation and placed under the general jurisdiction of the Post Office Department for operation.¹ In transferring the service to the Federal Government all employees, including officials and other persons, necessary for successful operation should be retained, and those whom the elimination of the duplicate service of the two companies renders unnecessary for the national system

¹The economic argument for the postalization of telegraphs and telephones is presented in the testimony of Hon. David J. Lewis before the commission.

should be absorbed into other branches of the Federal service as far as practicable.

2. At the time of the transfer to the Federal service a special commission should be appointed to revise the salary ratings and other working conditions and place them upon a proper basis.

TELEPHONE.

The investigations of the commission are the basis for the following statements:

1. The condition of the telephone operators in both interstate and local service is subject to grave criticism. The wages paid even in the cities having the highest standards are insufficient to provide decently for women who have no other means of support. The requirements and nervous strain incident to the service are so very severe that experienced physicians have testified that operators should work not more than five hours per day, whereas the regular working hours are from seven to nine per day. The operators, who are principally girls and young women, are required to work at night, going to and returning from their work at hours when they are subject to grave menace. The policy of the companies in general provides for sanitary and reasonably comfortable working places and for attention to the recreation and physical needs of the operators, but in a number of cities the conditions even in these respects are subject to severe criticism.

2. The telephone operators are unable to secure reasonable conditions for themselves because of their youth and the fact that they ordinarily remain in the service only a short time.

3. The organization of employees for their own protection is effectively resisted by the employing companies.

4. The American Telephone & Telegraph Co., with its subsidiary and affiliated corporations, controls more than 70 per cent of the total telephone business of the country. The American Telephone & Telegraph Co. has been enormously profitable and is well able to afford the necessary improvements in working conditions. The American Telephone & Telegraph Co. has increased its capitalization enormously without the investment of new capital.

5. The transaction by which the American Telephone & Telegraph Co., which had been a subsidiary of the American Bell Telephone Co., absorbed the parent company in 1899 was not only designed to evade the legal limitations contained in the Massachusetts charter of the American Bell Telephone Co., but resulted in the increase of the capitalization of the combination from \$25,886,300 to \$75,276,600 without the addition of any new capital.

6. The transmission of intelligence is a function which is specifically reserved by the Constitution to the Federal Government, but which in the telephone field has been permitted to become the practical monopoly of a single corporation.

It is suggested that the commission recommend:

1. The purchase by the Federal Government, after proper valuation, of the property of the interstate and local telephone companies, or such part of their equipment as may be necessary for the efficient operation of a national telephone system.

2. The transfer of all employees, including officials, necessary for the efficient operation of the national telephone system to the Federal service, as far as possible, and the absorption, as far as practicable, of all employees who are not necessary for the telephone system into other branches of the Federal service.

3. When such employees are transferred to the Federal service, the creation of a special commission to establish salary ratings and other working conditions on a proper basis.

4. In the meantime provision should be made by Congress for the creation of a minimum wage board to fix minimum wage standards for women employees who are engaged in the transmission of messages in interstate commerce. The board should be authorized to differentiate between localities in fixing minima, if on due consideration such differential rates should be deemed advisable.

5. The creation of minimum wage boards in the several States to fix minimum wages for all women employees engaged in service within the State.

THE PULLMAN CO.

The investigations and hearings of the commission developed the following facts:

1. The conductors and porters employed in the car service of the Pullman Co. are employed under conditions which seem to require radical readjustment. Both classes of employees are admitted by officials of the company to be underpaid.

The standard salary of the porters (\$27.50 per month) is such that the porters are obliged to secure tips from the public in order to live. The Pullman Co. is admitted by the chairman of the board of directors to be the direct beneficiary of the tips from the public to the extent of the difference between a fair wage and that which is now paid.

The hours of service are extremely long, the regulations of the company allowing porters and conductors when in service only four hours' sleep per night and penalizing them severely if they sleep while on duty. Employees of the Pullman Co. are subject to many other abuses, among which may be mentioned the arbitrary deduction from their salaries for such time as they may not be needed for the actual service of the company, although they are required to report at the office each morning and are sometimes compelled to wait the greater part of the day without compensation; the requirement that porters shall furnish blacking, although they are not permitted to charge passengers for the service of shoe cleaning; the system of arbitrary penalties for the infraction of multitudinous rules; the requirement that all employees shall purchase their uniforms from one mercantile establishment, the owners of which are largely interested in the Pullman Co.; and the lack of proper provision of sleeping quarters for employees when away from their home stations.

2. The Pullman Co. has a bonus system by which employees who have a "clean record" for the year receive an extra month's salary. This system serves to increase the earnings of those who receive the bonus, and is unquestionably appreciated by them. Nevertheless it is inequitable in penalizing with extra severity any infractions of

rules which occur during the latter half of the year, and puts into the hands of officials and inspectors a means of discrimination which can be arbitrarily exercised.

3. The effect of the tipping system is not only to degrade those who are obliged by their economic conditions to accept tips but to promote discrimination in the service of the public.

4. The employees of the Pullman Co. are unable to improve their condition through organization, as employees known to be members of labor unions are discharged, and through the means of an effective system of espionage employees are deterred from affiliating with labor unions.

5. The company is tremendously overcapitalized, having increased its capitalization from \$36,000,000 in 1893 to \$120,000,000 in 1915, without the investment of a single dollar on the part of the stockholders. Upon the basis of actual cash paid in, the annual dividends of the company are not less than 29 per cent. During the history of the company the stockholders have received cash dividends amounting to at least \$167,000,000 and special stock dividends of \$64,000,000, making a total of \$231,000,000 on an actual investment of \$32,601,238.

6. The company enjoys a practical monopoly of the sleeping-car service.

It is suggested that the commission recommend:

1. The enactment by Congress of a statute prohibiting the tipping of any employee of a public-service corporation engaged in interstate commerce and providing a proper fine for both the giver and the recipient of the tip.

2. The amendment of the existing law regulating the hours of service of train employees to include the employees engaged in the Pullman service.

3. The extension of the Newlands Act, as already suggested, to cover the Pullman Co.

RAILROADS.

The investigations of the commission with regard to railroads have been too limited to permit of general findings or recommendations. Enough evidence has, however, come before the commission with regard to three points to warrant attention.

1. The railroad construction camps are largely insanitary, overcrowded, and improperly equipped for the health and comfort of the employees. In addition, there are many abuses, such as overcharging at the commissary and grafting by foremen.

2. The so-called voluntary benefit associations of a number of the railroads constitute, under the present system of management, a great injustice to employees. These funds, which are contributed almost entirely by the employees, the management as a rule paying only the cost of administration, until recently were generally used to relieve the companies from liability for accident, employees being required to sign a release in favor of the company at the time that they became members of the benefit association. In some cases, even, the membership is compulsory. Nevertheless, the employees have no voice in the management and receive no equity when they are discharged. Finally, such associations, under their present management, serve to

exert an undue influence over employees, since the members, if they quit the service for any period or for any cause, sacrifice to the company all that has been paid in.

3. Under the authority granted by the several States the railroads maintain a force of police, and some, at least, have established large arsenals of arms and ammunition. This armed force, when augmented by recruits from detective agencies and employment agencies, as seems to be the general practice during industrial disputes, constitutes a private army clothed with a degree of authority which should be exercised only by public officials; these armed bodies, usurping the supreme functions of the State and oftentimes encroaching on the rights of the citizens, are a distinct menace to public welfare.

It is suggested that the commission recommend:

1. Thorough investigation by the Public Health Service of railroad construction camps as well as other labor camps, and the preparation of definite plans for such camps and a standard code of sanitary regulations.

2. The enactment by Congress of a statute expressly prohibiting corporations engaged in interstate commerce from inducing or compelling their employees to sign releases of liability for accidents.

3. Congress should enact a statute prohibiting interstate employers from requiring their employees to contribute to benefit funds, and providing for the participation of employees engaged in interstate commerce in the management of all benefit funds and other funds to which they contribute.

4. The regulation by Federal statute of the employment of police on interstate railroads. The statute should not only provide for the organization, personnel, and powers of such police, but should definitely provide that during labor disputes such police should be subject to the proper civil authorities and paid out of the public treasury. The statute should also provide that such corporations should be permitted to have firearms only under license, requiring that a definite record be maintained showing the character of each firearm and to whom it is issued.

5. The assumption by the States of full responsibility and definite provision not only for protecting the property of railroads, but for preventing trespass upon their property.

IV. INDUSTRIAL CONDITIONS IN ISOLATED COMMUNITIES.

The investigations and hearings of the commission are the basis for the following statements:

1. The conditions existing in typical industrial communities which are either wholly or in large part owned or controlled by a single corporation or individual employer, present every aspect of a state of feudalism except the recognition of specific duties on the part of the employer. The employees in such communities are dependent on a single corporation, or employer, for their livelihood. Furthermore, the employer in many cases controls the social and political life of such communities, either by the complete absorption of local political powers or by domination of the local authorities.

2. The fundamental rights of citizens in such communities are, as a general rule, seriously abridged, if not actually denied. Among

the rights most seriously violated are the right of free speech and assemblage and the right of public highways.

In some cases, as, for example, in Colorado, employers in such communities have assumed to usurp the functions of the Federal Government itself in the issuance of money orders, and have not only denied employees access to the post office when located in their company stores but have opened and otherwise interfered with the mail directed to the employees.

Such feudalistic conditions tend to develop principally in connection with the private exploitation of natural resources, being most frequently found in mining camps, lumber camps (including turpentine camps), and large plantations. There are, however, striking examples even in the case of manufactures, as, for examples, the textile towns and steel towns.

3. The most extreme form of domination and control exists in what are known as "closed camps," where the employer owns all the land upon which such camps are located and, because of this private ownership, not only exercises control over the local government but dictates arbitrarily who shall be permitted to come into or pass through such communities. It has frequently been argued that such communities are simply the inevitable accompaniment of the development of new country and will be eliminated with time. This is not true, however, as the commission's investigations have disclosed a large number of "closed camps" which have been in existence for more than a generation.

It is suggested that the commission recommend:

1. The enactment of appropriate State legislation providing that where communities develop, even upon privately owned land, the powers of the civil government shall not be interfered with, nor shall the rights of access to the residence of any person be restricted, nor shall the rights of persons to come and go unmolested, to speak freely and to assemble peacefully, be interfered with or considered to stand upon a different basis from the rights of persons in other communities.

2. In the case of public lands containing timber or minerals, which are now or may hereafter come into the possession of the Federal Government, it should be provided by statute that neither the lands nor the mineral rights should under any circumstances be sold, but should be used only upon lease for a limited term, such lease to contain as a part of the contract the conditions with regard to the rights of inhabitants as recited above and such lease to be forfeitable without recourse in case of the infraction of said conditions.

3. The Post Office Department should be directed to report to Congress all communities in which the post office is in any company's store or other building operated by an employer or in which the postmaster is a private employer or the agent of an employer. The report should show the facts separately for those communities in which the employer or corporation operates an industry upon which any large number of inhabitants are dependent.

4. Congress and the State legislatures should enact statutes providing that any attempt on the part of an employer to influence his employees, either directly or indirectly, in connection with any Federal election, either for or against any particular candidate, shall

constitute intimidation; and further specifying that it shall constitute intimidation for any employer to give notice to his workmen that in the event of the election of any particular candidate the establishment will not be operated.

V. THE CONCENTRATION OF WEALTH AND INFLUENCE.

The evidence developed by the hearings and investigations of the commission is the basis for the following statements:

1. The control of manufacturing, mining, and transportation industries is to an increasing degree passing into the hands of great corporations through stock ownership, and control of credit is centralized in a comparatively small number of enormously powerful financial institutions. These financial institutions are in turn dominated by a very small number of powerful financiers.

2. The final control of American industry rests, therefore, in the hands of a small number of wealthy and powerful financiers.

3. The concentration of ownership and control is greatest in the basic industries upon which the welfare of the country must finally rest.

4. With few exceptions each of the great basic industries is dominated by a single large corporation, and where this is not true the control of the industry through stock ownership in supposedly independent corporations and through credit is almost, if not quite, as potent.

5. In such corporations, in spite of the large number of stockholders, the control through actual stock ownership rests with a very small number of persons. For example, in the United States Steel Corporation, which had in 1911 approximately 100,000 shareholders, 1.5 per cent of the stockholders held 57 per cent of the stock, while the final control rested with a single private banking house.

Similarly, in the American Tobacco Co., before the dissolution, 10 stockholders owned 60 per cent of the stock.

6. Almost without exception the employees of the large corporations are unorganized, as a result of the active and aggressive "nonunion" policy of the corporation managements.

Furthermore, the labor policy of the large corporations almost inevitably determines the labor policy of the entire industry.

7. A careful and conservative study shows that the corporations controlled by six financial groups and affiliated interests employ 2,651,684 wage earners and have a total capitalization of \$19,875,200,000. These six financial groups control 28 per cent of the total number of wage earners engaged in the industries covered by the report of our investigation. The Morgan-First National Bank group alone controls corporations employing 785,499 wage earners. That this control is effective is shown by the following telegram from J. P. Morgan to E. H. Gary:

AIX LES BAINS.

E. H. GARY, *New York:*

Have received your cable of yesterday. My own views are in accordance with those of the financial committee in New York. Certainly until question of wages has been settled by the coal and railroads, which still in abeyance, but settlement seems imminent. Whole question wages should be settled simultaneously by all interests if possible. Going Paris Wednesday. Will see there

H. C. F., P. A. B. W.,¹ and will cable you result of interview. If possible and meets your approval, think better wait until after interview. Perfectly delightful here. Weather superb.

J. P. M.²

8. The lives of millions of wage earners are therefore subject to the dictation of a relatively small number of men.

9. These industrial dictators for the most part are totally ignorant of every aspect of the industries which they control except the finances, and are totally unconcerned with regard to the working and living conditions of the employees in those industries. Even if they were deeply concerned, the position of the employees would be merely that of the subjects of benevolent industrial despots.

10. Except, perhaps, for improvements in safety and sanitation, the labor conditions of these corporation-controlled industries are subject to grave criticism and are a menace to the welfare of the Nation.

11. In order to prevent the organization of employees for the improvement of working conditions, elaborate systems of espionage are maintained by the large corporations which refuse to deal with labor unions, and employees suspected of union affiliation are discharged.

12. The domination by the men in whose hands the final control of a large part of American industry rests is not limited to their employees, but is being rapidly extended to control the education and "social service" of the Nation.

13. This control is being extended largely through the creation of enormous privately managed funds for indefinite purposes, hereinafter designated "foundations," by the endowment of colleges and universities, by the creation of funds for the pensioning of teachers, by contributions to private charities, as well as through controlling or influencing the public press.

14. Two groups of the "foundations," namely, the Rockefeller and Carnegie foundations, together have funds amounting to at least \$250,000,000, yielding an annual revenue of at least \$13,500,000, which is at least twice as great as the appropriations of the Federal Government for similar purposes, namely, education and social service.

15. The funds of these foundations are exempt from taxation, yet during the lives of the founders are subject to their dictation for any purpose other than commercial profit. In the case of the Rockefeller group of foundations, the absolute control of the funds and of the activities of the institutions now and in perpetuity rests with Mr. Rockefeller, his son, and whomsoever they may appoint as their successors.

16. The control of these funds has been widely published as being in the hands of eminent educators and public-spirited citizens. In the case of the Rockefeller foundations, however, not only is the control in the hands of Mr. John D. Rockefeller, jr., and two of the members of the personal staff of Mr. John D. Rockefeller, sr., who constitute the finance committee, but the majority of the trustees of the funds are salaried employees of Mr. Rockefeller or the founda-

¹ H. C. Frick and P. A. B. Widener.

² Read at meeting of finance committee, United States Steel Corporation, April 27, 1909.

tions, who are subject to personal dictation and may be removed at any moment.

17. The funds of these foundations are largely invested in securities of corporations dominant in American industry, whose position has been analyzed under the early headings of this section. The policies of these foundations must inevitably be colored, if not controlled, to conform to the policies of such corporations.

18. The funds of the foundations represent largely the results either of the exploitation of American workers through the payment of low wages or of the exploitation of the American public through the exaction of high prices. The funds, therefore, by every right belong to the American people.

19. The powers of these foundations are practically unlimited, except that they may not directly engage in business for profit. In the words of President Schurman, of Cornell, himself a trustee of the Carnegie foundation.

Under the terms of this broad charter there is scarcely anything which concerns the life and work of individuals or nations in which the Rockefeller foundation would not be authorized to participate. As the safety of the State is the supreme condition of national civilization the foundation might in time of war use its income or its entire principal for the defense of the Republic. In time of peace it might use its funds to effect economic and political reforms which the trustees deem essential to the vitality and efficiency of the Republic. The foundation might become the champion of free trade or protection, of trusts, or of the competing concerns out of which they grow, of socialism or individualism, of the program of the Republican Party or the program of the Democratic Party. It might endow the clergy of all religious denominations, or it might subsidize any existing or any new religious denomination. To-morrow it might be the champion of the Christian religion, and a hundred years hence furnish an endowment for the introduction of Buddhism into the United States. It might build tenement houses for the poor in New York City, or carry the results of science to enrich the exhausted soils of the East or the arid tracts of the West. It might set up an art gallery in every State of the United States or endow universities which would rival the great State universities of the West. With the consent of the legislature it might relieve any State of the care of its insane, pauper, and dependent classes or construct roads for the benefit of farmers and motorists. These may not be likely objects for the application of the funds of the Rockefeller foundation. I am not, however, attempting to forecast its work but to understand its charter.

And, so far as I can see, the proposed charter would authorize all these and a multitude of similar activities. If the object of the Rockefeller Foundation is to be coextensive with human civilization, then it may do anything and everything which its trustees think likely to effect reform or improvement in the material, economic, intellectual, artistic, religious, moral, and political conditions of the American people or of mankind.

20. The charters of these foundations, with their almost unlimited powers, were granted under conditions of such laxity that it has been testified by an eminent legal authority who made an extensive investigation that those granted by New York State are legally defective

and unconstitutional. Furthermore, evidence developed by the hearings of the commission showed that in increasing the number of its trustees without complying with the requirements of the law governing corporations the Rockefeller Foundation has already been guilty of a breach of the law.

21. These foundations are subject to no public control, and their powers can be curbed only by the difficult process of amending or revoking their charters. Past experience, as, for example, in the case of the insurance companies, indicates that the public can be aroused only when the abuses have become so great as to constitute a scandal.

22. The entrance of the foundations into the field of industrial relations, through the creation of a special division by the Rockefeller Foundation, constitutes a menace to the national welfare to which the attention not only of Congress but of the entire country should be directed. Backed by the \$100,000,000 of the Rockefeller Foundation, this movement has the power to influence the entire country in the determination of its most vital policy.

23. The documentary evidence in the possession of the commission indicates:

(a) That the so-called "investigation of industrial relations" has not, as is claimed, either a scientific or a social basis, but originated to promote the industrial interests of Mr. Rockefeller. The original letter inviting Mr. W. L. Mackenzie King to associate himself with the Rockefellers stated that Mr. Rockefeller and Mr. Greene in "their purely corporate capacity as owners and directors of large industries" desired his aid.

(b) That the investigation forms part of what Mr. Rockefeller, in a letter to Mr. Ivy L. Lee (the press agent of the Colorado operators), called the "union educational campaign," which is referred to by Mr. Bowers as "the fight for the open shop," the results of which are clearly manifested in the conditions existing in the camps of the Colorado Fuel & Iron Co., conducted on the "open-shop" principle.

(c) That Mr. Rockefeller planned to utilize in this campaign literature containing statements which were known to him at the time to be untrue and misleading (as, for example, the numerous misstatements in the "Sermon to young men" of Dr. Newall Dwight Hillis, including the statement that the Colorado operators offered to recognize the miners' union), and also literature containing statements which constituted a malicious libel upon a large body of American citizens—for example, the following statement of Prof. John J. Stevenson:

Labor unions defy the law, but are ever ready to demand its protection; their principles are no better than those of the India thugs, who practiced robbery and murder in the name of the goddess Cali.

(d) That the investigation of industrial relations is not being made in good faith, inasmuch as its director states that he will not now nor hereafter make public his findings regarding a most important part of his investigation, namely, the investigation in Colorado.

24. The purpose of Mr. Rockefeller to influence the public press is clearly shown by the employment of an experienced publicity expert as a member of his personal staff, and is indicated by his evident interest in the ownership or control of a number of publications, of which we have records dating from the inquiry of his

secretary regarding the Pueblo Star Journal in May, 1913, to the extensive conferences regarding a loan of \$125,000 to finance the Nation's Business, the organ of the National Chamber of Commerce, which was established and given a semiofficial status through the instrumentalities of the Secretary of Commerce and Labor, with the sanction of a former President of the United States.

25. The extent of the possible influence of these foundations and private endowments of institutions for education and public service is shown by a large amount of evidence in the possession of the commission. The following examples may be cited:

(a) The adoption of a definite line of policy by the Bureau of Municipal Research of New York to meet the conditions imposed by Mr. Rockefeller in connection with proposed contributions.

(b) The abandonment by several colleges and universities of sectarian affiliations and charter clauses relating to religion in order to secure endowments from the Carnegie Corporation and pensions for professors from the Carnegie Foundation for the Advancement of Teaching. It would seem conclusive that if an institution will willingly abandon its religious affiliations through the influence of these foundations, it will even more easily conform to their will any other part of its organization or teaching.

26. Apart from these foundations there is developing a degree of control over the teachings of professors in our colleges and universities which constitutes a most serious menace. In June of this year two professors, known throughout their professions as men of great talent and high character, were dropped from the positions they had occupied and no valid reason for such action was made public. Both were witnesses before the commission, and made statements based upon their own expert knowledge and experience which were given wide publicity. One was a professor of law in a State university, who had acted as counsel for the strikers in Colorado; the other a professor of economics, who had not only been active in fights in behalf of child-labor legislation and other progressive measures, but had recently published a work comparing the income paid for property ownership with the income paid for all classes of service.

In the case of the State university we know that the coal operators in conjunction with other business interests had gained the ascendancy and exercised a great degree of control over the former governor of the State, that the coal operators were bitterly opposed to the professor in question, and that the dismissal of the professor had been publicly urged by the operators upon numerous occasions, and we have the uncontroverted statement of the professor that he had been warned that if he testified before the commission he would not be reappointed. In the case of the professor in the other university (which, though privately endowed, receives large appropriations from the State) we know that its trustees are interested in corporations which have bitterly opposed progressive legislation, and are men whose incomes are derived from property ownership and not from service.

In the face of such an enormous problem one can only frankly confess inability to suggest measures which will protect the Nation from the grave dangers described. It is believed, however, that if Congress will enact the measures already recommended, providing for a heavy tax on large inheritances with a rigid limitation on the

total amount of the bequest, for the reclamation by the Federal Government of all parts of the public domain (including mineral rights) which have been secured by fraud, and for a tax on non-productive land and natural resources, a great step in the right direction will have been taken.

As regards the "foundations" created for unlimited general purposes and endowed with enormous resources, their ultimate possibilities are so grave a menace, not only as regards their own activities and influence but also the benumbing effect¹ which they have on private citizens and public bodies, that if they could be clearly differentiated from other forms of voluntary altruistic effort it would be desirable to recommend their abolition. It is not possible, however, at this time to devise any clear-cut definition upon which they can be differentiated.

As the basis for effective action, it is suggested that the commission recommend:

1. The enactment by Congress of a statute providing that all incorporated nonprofit-making bodies whose present charters empower them to perform more than a single specific function and whose funds exceed \$1,000,000 shall be required to secure a Federal charter.

The Federal charter should contain the following provisions:

(a) Definite limitation of the funds to be held by any organization, at least not to exceed the largest amount held by any at the time of the passage of the act.

(b) Definite and exact specifications of the powers and functions which the organization is empowered to exercise, with provision for heavy penalties if its corporate powers are exceeded.

(c) Specific provision against the accumulation of funds by the compounding of unexpended income and against the expenditure in any one year of more than 10 per cent of the principal.

(d) Rigid inspection of the finances as regards both investment and expenditure of funds.

(e) Complete publicity through open reports to the proper Government officials.

(f) Provision that no line of work which is not specifically and directly mentioned in the articles of incorporation shall be entered upon without the unanimous consent and approval of the board of trustees, nor unless Congress is directly informed of such intention through communication to the Clerk of the House and the Clerk of the Senate, which shall be duly published in the Congressional Record, nor until six months after such intention has been declared.

2. Provision by Congress for the thorough investigation, by a special committee or commission, of all endowed institutions, both secular and religious, whose property holdings or income exceeds a moderate amount. The committee or commission should be given full power to compel the production of books and papers and the attendance and testimony of witnesses. It should be authorized and directed to investigate not only the finances of such institutions but all their activities and affiliations.

¹ A striking illustration of the benumbing effect of such foundations was revealed by the almost complete cessation of private activity for the relief of the Belgians as soon as the Rockefeller Foundation issued to the press a statement of its intention to undertake such relief.

3. As the only effective means of counteracting the influence of the foundations, as long as they are permitted to exist, consists in the activities of governmental agencies along similar lines, the appropriations of the Federal Government for education and social service should be correspondingly increased.

VI. THE LAND QUESTION AND THE CONDITION OF AGRICULTURAL LABOR.

It was obviously impossible for the commission to attempt a detailed investigation of agricultural condition, but because of the very immediate bearing of the land question on industrial unrest, it was felt necessary to make as thorough investigation as possible of the phases which seemed to have the most direct bearing on our general problem. The phases selected for discussion were, first, the concentration of land ownership as shown by existing statistics; second, the problem of seasonal and casual agricultural labor; third, the increase and change in the character of farm tenancy; and, fourth, the introduction of industrial methods into agriculture through the development of corporations operating large tracts of land. The findings and recommendations with reference to the concentration of ownership and the problems of seasonal labor are set forth elsewhere. At this point it is desired to present the results of the investigations of tenancy and agricultural corporations.

The investigation of these problems was confined practically to the Southwest, because it is in this region that the systems have become most fully developed and their results in the form of the acute unrest of a militant tenant movement are most easily studied. The investigations in this region, however, were very thorough, consisting of detailed studies and reports by field investigators, which were later confirmed by a public hearing.

As a result of these investigations the following conclusions are fully justified:

1. Tenancy in the Southwestern States is already the prevailing method of cultivation and is increasing at a very rapid rate. In 1880 Texas had 65,468 tenant families, comprising 37.6 per cent of all farms in the State. In 1910 tenant farmers had increased to 219,571 and operated 53 per cent of all farms in the State. Reckoning on the same ratio of increase that was maintained between 1900 and 1910, there should be in Texas in the present year (1915) at least 236,000 tenant farmers. A more intensive study of the field, however, shows that in the 82 counties of the State where tenancy is highest the average percentage of tenants will approximate 60.

For Oklahoma we have not adequate census figures so far back, but at the present time the percentage of farm tenancy in the State is 54.8, and for the 47 counties where the tenancy is highest the percentage of tenancy is 68.13.

2. Tenancy, while inferior in every way to farm ownership from a social standpoint, is not necessarily an evil if conducted under a system which protects the tenants and assures cultivation of the soil under proper and economical methods, but where tenancy exists under such conditions as are prevalent in the Southwest, its increase can be regarded only as a menace to the Nation.

3. The prevailing system of tenancy in the Southwest is share tenancy, under which the tenant furnishes his own seed, tools, and

teams and pays the landlord one-third of the grain and one-fourth of the cotton. There is, however, a constant tendency to increase the landlord's share through the payment either of cash bonuses or of a higher percentage of the product. Under this system tenants as a class earn only a bare living through the work of themselves and their entire families. Few of the tenants ever succeed in laying by a surplus. On the contrary, their experiences are so discouraging that they seldom remain on the same farm for more than a year, and they move from one farm to the next, in the constant hope of being able to better their condition. Without the labor of the entire family the tenant farmer is helpless. As a result, not only is his wife prematurely broken down, but the children remain uneducated and without the hope of any condition better than that of their parents. The tenants having no interest in the results beyond the crops of a single year, the soil is being rapidly exhausted and the conditions, therefore, tend to become steadily worse. Even at present a very large proportion of the tenants' families are insufficiently clothed, badly housed, and underfed. Practically all of the white tenants are native born. As a result of these conditions, however, they are deteriorating rapidly, each generation being less efficient and more hopeless than the one proceeding.

4. A very large proportion of the tenants are hopelessly in debt and are charged exorbitant rates of interest. Over 95 per cent of the tenants borrow from some source, and about 75 per cent borrow regularly year after year. The average interest rate on all farm loans is 10 per cent, while small tenants in Texas pay 15 per cent or more. In Oklahoma the conditions are even worse, in spite of the enactment of laws against usury. Furthermore, over 80 per cent of the tenants are regularly in debt to the stores from which they secure their supplies, and pay exorbitantly for this credit. The average rate of interest on store credit is conservatively put at 20 per cent and in many cases ranges as high as 60 per cent.

5. The leases are largely in the form of oral contracts which run for only one year and which make no provision for compensation to the tenant for any improvements which may be made upon the property. As a result, tenants are restrained from making improvements, and in many cases do not properly provide for the upkeep of the property.

6. Furthermore, the tenants are in some instances the victims of oppression on the part of landlords. This oppression takes the form of dictation of character and amount of crops, eviction without due notice, and discrimination because of personal and political convictions. The existing law provides no recourse against such abuses.

7. As a result both of the evils inherent in the tenant system and of the occasional oppression by landlords, a state of acute unrest is developing among the tenants and there are clear indications of the beginning of organized resistance which may result in civil disturbances of a serious character.

8. The situation is being accentuated by the increasing tendency of the landlords to move to the towns and cities, relieving themselves not only from all productive labor, but from direct responsibility for the conditions which develop. Furthermore, as a result of the increasing expenses incident to urban life there is a marked tendency

to demand from the tenant a greater share of the products of his labor.

9. The responsibility for the existing conditions rests not upon the landlords, but upon the system itself. The principal causes are to be found in the system of short leases, the system of private credit at exorbitant rates, the lack of a proper system of marketing, the absence of educational facilities, and last but not least the prevalence of land speculation.

10. A new factor is being introduced into the agricultural situation through the development of huge estates owned by corporations and operated by salaried managers upon a purely industrial system. The labor conditions on such estates are subject to grave criticism. The wages are extremely low, 80 cents per day being the prevailing rate on one large estate which was thoroughly investigated; arbitrary deductions from wages are made for various purposes; and a considerable part of the wages themselves are paid in the form of coupons, which are in all essential particulars the same as the "scrip" which has been the source of such great abuse. Furthermore, the communities existing on these large estates are subject to the complete control of the land-owning corporation, which may regulate the lives of citizens to almost any extent. There is an apparent tendency toward the increase of these large estates, and the greatest abuses may be expected if they are allowed to develop unchecked.

11. Prompt and effective action on the part of the States and Nation is necessary if any alleviation of the conditions which have been described is to be achieved.

It is suggested that the commission recommend:

1. The development through legislation of longer time farm leases that will make for fair rents, security of tenure, and protection of the interests of the tenant in the matter of such improvements as he may make on a leasehold in his possession. Such legislation should look forward to leasing systems that will increase tillage, improve the yielding powers of the soil and maintain a greater population.

In order to secure this desired end it is suggested that the commission further recommend the creation of:

2. National and State land commissions with powers—

(a) To act as land courts with powers to hear evidence given by landlord and tenants as to questions that have to do with fair rents, fixity of tenure and improvements made by tenants on landlords' property; to gather evidence, independently of both parties, that will the better enable such land courts to arrive at the true facts in each case; and to render judgment that will be mandatory for such time as the contractual relationship may be determined to hold.

(b) To operate farm bureaus for the following purposes:

First. To act as an agent between landlords and tenants in the distribution of tenant labor.

Second. To act as an agent between landlords and tenants in the preparation of equitable contracts.

Third. To act as an information agency to assist home-seeking farmers.

Fourth. To assist in the distribution of seasonal labor.

3. The development of better credit facilities through the assistance of the Government and cooperative organization of farmers and tenants. No single measure can be recommended; the results must be achieved through the development of a sound rural-credit system, the development of land banks, mortgage associations and credit unions. Foreign experience shows that through these means the rate of interest can be greatly reduced and the security of both the borrower and the lender can be increased.

4. The general introduction of modernized rural schools and compulsory education of children. The functions of the school system should extend beyond education to the social service of the entire rural community, assisting in the organization of farmers and tenants for cooperative purposes, and promoting other measures looking to the community's welfare.

5. The revision of the taxation system so as to exempt from taxation all improvements and tax unused land at its full rental value.

VII. JUDICIAL SETTLEMENT OF LABOR CLAIMS AND COMPLAINTS.

The investigations of the commission are the basis for the following statements:

1. Among workers of every class there are constantly arising various questions for judicial settlement which under present conditions can not be speedily or satisfactorily adjusted.

2. These claims are of a very diverse character and include not only cases of actual injustice through the retention of wages, but questions of interpretation of contract and the establishment of justice in cases in which contracts are lacking.

3. The ordinary courts are unfitted to decide such questions, not only because of the method of procedure but because of the unfamiliarity of ordinary magistrates and judges with the conditions involved in such claims.

It is suggested that the commission recommend:

1. The establishment either by the States or by municipalities of industrial courts similar to those which have proved to be successful in European countries. The organization and method of procedure of such courts are described in detail in Bulletin No. 98 of the United States Bureau of Labor and need not be discussed here.

2. The Commissioners of Labor or the industrial commissions of the several States should be authorized and directed, where such powers do not now exist, to receive the legal complaints of all classes of workmen, and, where they are found to have a proper basis, to prosecute such claims vigorously, with a view to securing either a voluntary settlement or the award of adequate recompense by the proper tribunal. The commissioners of labor or the industrial commissions should be given adequate legal assistance to enable them to prosecute such claims promptly and vigorously. Proper steps should be taken to provide for cooperation with the Federal Immigration Bureau, if the recommendation on page 51 is adopted.

3. The States and municipalities should consider the desirability of creating an office similar to that of the public defender in Los Angeles to act in civil claims of small size.

VIII. THE LAW RELATING TO TRADE-UNIONS AND INDUSTRIAL DISPUTES.

The commission has conducted through its agents extensive investigations and has held hearings at which the persons who have devoted great study to the question of trade-union law testified at length. The investigations were directed both to establishing the present status of the law governing trade-unions and industrial disputes and to ascertaining the practical effects of certain classes of laws and court decisions. The results of the investigations are largely embodied in the reports of Mr. J. Wallace Bryan, of the Maryland bar, and Mr. Edwin E. Witte.

Because of the necessity for exactness in dealing with questions which are so involved and which have to so large an extent been clouded by contradictory court decisions, it is impossible to present a satisfactory summary of the conclusions which have been reached upon this subject. It may, however, be said that in substance the situation revealed by these investigations is as follows:

1. The greatest uncertainty exists regarding the legal status of almost every act which may be done in connection with an industrial dispute. In fact, it may be said that it depends almost entirely upon the personal opinion and social ideas of the court in whose jurisdiction the acts may occur.

2. The general effect of the decisions of American courts, however, has been to restrict the activities of labor organizations and deprive them of their most effective weapons, namely, the boycott and the power of picketing, while, on the other hand, the weapons of employers, namely, the power of arbitrary discharge, of blacklisting, and of bringing in strike breakers, have been maintained, and legislative attempts to restrict the employers' powers have generally been declared unconstitutional by the courts. Furthermore, an additional weapon has been placed in the hands of the employers by many courts in the form of sweeping injunctions, which render punishable acts which would otherwise be legal, and also result in effect in depriving the workers of the right to jury trial.

3. Important steps have been taken to deal with this situation by the enactment of the Clayton Act, applying to the Federal jurisdiction, and by the passage of laws in Massachusetts and New York which define the rights of parties engaged in industrial disputes. The actual effect of the Clayton Act can not be ascertained until it has been tested in the courts, but eminent legal authorities have expressed grave doubts that it will accomplish the desired results. At any rate, it does not seem to remove the root of the existing injustice, and, furthermore, in all the States except New York and Massachusetts the grave and uncertain situation already described exists. This situation must be corrected.

4. There are, apparently, only two lines of action possible: First, to restrict the rights and powers of the employers to correspond in substance to the powers and rights now allowed to trade-unions, and second, to remove all restrictions which now prevent the freedom of action of both parties to industrial disputes, retaining only the ordinary civil and criminal restraints for the preservation of life, property, and the public peace. The first method has been tried repeatedly and has failed absolutely, not only because of the interven-

tion of the courts but because the very nature of the acts complained of on the part of employers (blacklisting and arbitrary discharge) makes it impossible to prevent them effectively by any form of legislation or administration. The only method, therefore, seems to be the removal of all restrictions upon both parties, thus legalizing the strike, the lockout, the boycott, the blacklist, the bringing in of strike breakers, and peaceful picketing. This has been most successfully accomplished by the British trades disputes act, which is the result of 50 years of legal evolution, and in its present form seems to work as successfully as could possibly be expected.

It is suggested, therefore, that the commission recommend:

1. The enactment by Congress and the States of legislation embodying the principles contained in the British trades disputes act, the text of which is as follows:

An agreement or combination of two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy if such an act committed by one person would not be punishable as a crime. An act done in pursuance of an agreement or combination by two or more persons shall, if done in contemplation or furtherance of a trade dispute, not be actionable unless the act, if done without any such agreement or combination, would be actionable.

An action against a trade-union, whether of workmen or masters, or against any members or officials thereof on behalf of themselves and all other members of the trade-union in respect of any tortious act alleged to have been committed by or on behalf of the trade-union, shall not be entertained by any court.

An act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment or that it is an interference with the trade, business, or employment of some other person, or with the right of some other person to dispose of his capital or his labor as he wills.

It shall be lawful for one or more persons, acting either on their own behalf or on behalf of a trade-union, or of an individual employer or firm in contemplation or furtherance of a trade dispute to attend at or near a house or place where a person resides or works or carries on business or happens to be, if they so attend merely for the purpose of peacefully obtaining or communicating information, or of peacefully persuading any person to work or abstain from working.

Every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority—

1. Uses violence to or intimidates such other person or his wife or children, or injures his property; or

2. Persistently follows such other person about from place to place; or

3. Hides any tools, clothes, or other property owned or used by the other person, or deprives him of or hinders him in the use thereof; or

4. Watches or besets the house or other place where such other person resides or works or carries on business or happens to be, or the approach to such a house or place; or

5. Follows such other person with two or more other persons in a disorderly manner in or through any street or road, shall on conviction thereof by a court of summary jurisdiction, or an indictment as hereinafter mentioned, be liable either to pay a penalty not exceeding £20, or to be imprisoned for a term not exceeding three months, with or without hard labor.

IX. THE POLICING OF INDUSTRY.

The commission has made extensive investigations and has heard many witnesses upon this subject, and as a result the following conclusions are justified:

1. The problem of policing industry is generally conceived to lie in the suppression of violence and the protection of life and property; but in reality consists in the more fundamental problem of protecting the rights of employers and employees as well as preserving the peace.

THE ORIGIN OF INDUSTRIAL VIOLENCE.

2. Violence is seldom, if ever, spontaneous, but arises from a conviction that fundamental rights are denied and that peaceful methods of adjustment can not be used. The sole exception seems to lie in the situation where, intoxicated with power, the stronger party to the dispute relies upon force to suppress the weaker.

3. The arbitrary suppression of violence by force produces only resentment, which will rekindle into greater violence when opportunity offers. Violence can be prevented only by removing the causes of violence; industrial peace can rest only upon industrial justice.

4. The origin of violence in connection with industrial disputes can usually be traced to the conditions prevailing in the particular industry in times of peace or to arbitrary action on the part of governmental officials which infringes on what are conceived to be fundamental rights. Violence and disorder during actual outbreaks usually result from oppressive conditions that have obtained in a particular shop or factory or in a particular industry. Throughout history where a people or a group have been arbitrarily denied rights which they conceived to be theirs, reaction has been inevitable. Violence is a natural form of protest against injustice.

5. Violence in industrial disputes is not immediately the product of industrial conditions, but of the attitude of the parties to the dispute after grievances or demands have been presented. The principal sources of an attitude leading to violence are:

(a) Arrogance on the part of the stronger party. This may result immediately in violence through the use of force for the suppression of the weaker party. The force used may be physical or industrial. Physical force may be and is used by both employers and employees, through intimidation, assaults, or attacks on property. Such physical aggression is seldom used by employees, as they are strategically the weaker party and the results are negative; only

under exceptional circumstances can an employer be coerced by the use of force or intimidation. The exceptions seem to lie in the use of secret means, such as dynamite, with the object of weakening the employer's resistance.

The use of force by workers is normally directed not against the person or property of the employer, but against strike breakers and guards. Many instances of the use of physical force by the agents of employers have, however, come before the commission, indicating a relatively wide use, particularly in isolated communities. Such acts of violence usually take the form of assaults upon the leaders of the workers or upon organizers.

The instruments of industrial force belong chiefly to the employer, because of his control of the job of the worker. Their use is more common and more effective than any other form of violence at the command of the employer. The most powerful weapon is the power of discharge, which may be used indiscriminately upon mere suspicion, which under certain conditions may be almost as potent, either in use or threat, as the power of life and death. It is the avowed policy of many employers to discharge any man who gives any sign of dissatisfaction on the theory that he may become a trouble maker or agitator.

The only corresponding weapon in the hands of the workers is sabotage, in the form either of malicious destruction of property or of interference with production. The field of its use is much more restricted in practice than in theory, and its results at best are negative and produce in the employer only a blind resentment and indiscriminating hate. Sabotage as a policy shows no signs of developing in American industry.

(b) Equally productive of an attitude leading to violence is the denial of the use of peaceful methods of adjusting grievances, or the creation of a situation in which their use becomes impossible.

On the part of the employer the arbitrary acts which may be classed under this general head are: Denial of the right to organize; refusal to consider the complaints of workers; refusal to meet the authorized representatives of workers.

Under modern industrial conditions any one of these acts makes peaceful negotiation and settlement impossible. Without organization of the workers their collective claims can not be considered; without the right to appoint such representatives as they choose, workers are at the mercy of the employer's power of discharge, and are usually unequal to the task of presenting and arguing their claims; while the refusal to consider grievances leaves only the alternative of the strike.

On the part of the workers, the possibility of peaceful settlement may be destroyed by refusal to discuss claims, by internal dissensions which render collective and definite action looking to a settlement impossible, and by the issuance of ultimata which allow no time for consideration and negotiaton. In any one of these situations the employer has only the choice between tame submission or absolute resistance to the demands of the workers.

(c) The immediate cause of violence in connection with industrial disputes is almost without exception the attempt to introduce strike breakers to take the place of the workers who have struck or who are

locked out. The entire problem of policing industrial disputes grows out of the problem of the strike breaker and the attitude of the State toward him.

All experience shows that if no attempt is made to operate the plant, violence and disturbances requiring the police are practically unknown, whereas the attempt of strike breakers to reach the plant, particularly where strikers are enjoined or prevented from using reasonable means to inform them of the existence of the strike and to use persuasive methods to keep them from entering the plant, is invariably accompanied by disorder and sometimes by active violence.

The existing attitude of the courts and of governmental officials generally is that the entire machinery of the State should be put behind the strike breaker. This attitude is based upon the theory that two important rights are involved—first, “the right of the strike breaker to work,” and, second, “the right of the employer to do business.” During earlier years, the right of the strike breaker was stressed by the courts, but since the decision of Vice Chancellor Stevenson in 1902 (*Jersey City Ptg. Co. v. Cassidy*, 53 Atl., 230), in which the doctrine was announced as “recently recognized,” the right of the employer to do business has been in favor apparently because of its wider application and the fact that being denominated a property right, injunctions could regularly be issued for its protection. Regardless, however, of their origin, both of these so-called rights seem to have been based upon misconceptions by the courts. The “right to work” guaranteed to the strike breaker seems to be based upon the conception that the strike breaker is normally a workingman, who seeks work and desires to take the place of the striker. The fact is, practically without exception, either that the strike breaker is not a genuine workingman but is a professional who merely fills the place of the worker and is unable or unwilling to do steady work, or, if he is a bona fide workingman, that he is ignorant of conditions or compelled to work under duress. The nonworking character of the strike breaker is shown by the fact that very few are ever retained as workers after the termination of a strike, while the attitude of genuine workingmen toward strike breaking is shown by the significant fact that in the bids of employment agencies and detective agencies to furnish strike breakers it is provided that guards will be furnished with each car “to prevent escape in transit,” and by the fact that when men are candidly informed in the public employment offices of the existence of a strike, workers practically never apply for such positions, even though they may be in dire want.

The second misconception is contained in the idea that the “right to do business” is an absolute right. Besides the fact that it has only been insisted upon by the courts within the past 20 years and has no express legislative or constitutional sanction whatever, this right is subject to the most severe limitation and infringement even without due process of law. Not only can the legislature limit the right to do business in almost every conceivable way, but health authorities are given power to suspend it entirely if the public safety demands, as in the case of either a human or an animal epidemic. Furthermore, the courts can not and will not guarantee in any way the “good will” which is supposed to be the property aspect of the right to

do business, nor will they assess damages on account of any alleged injury based upon the "probable expectancy" of the business.

The right to do business is in fact permitted only so far as its exercise is in the public interest, and it may be restricted or prohibited through the police power whenever it is dangerous or in any way deleterious to the public. This is the reason underlying not only quarantine but every form of regulation and prohibition.

The plea of the workers for the assumption of a new attitude in relation to strike breakers is, however, based not only upon the negative character of the rights of the employer and the strike breaker, but upon a positive though somewhat undefinable demand for recognition that strikers have a right to the jobs which they have left until their grievances are in some way adjusted. The argument is not only that when workers are willing to strike and sacrifice their livelihood, the conditions against which they protest must be assumed to be socially injurious, but, even more, that the worker who has struck in support of his demand for better conditions has not abandoned his job, but, in fact, has a keener interest in it than when quietly submitting to distasteful conditions.

At the very basis of the workers' contentions, however, lies the realization that working conditions can be improved only by strikes and that no strike can be won if the employer can operate his plant without difficulty. This is becoming increasingly true with every step in the Nation's industrial development. During more primitive periods, if workers struck their places could not be filled except through the existence of a surplus of qualified labor in the community or by enticing workers from other employers. Now, the development of transportation, the establishment of specialized agencies for supplying strikebreakers, and the growth of large corporations, which can shift employees from one plant to another, have given each employer a command of the labor market of the entire country. There are agencies in every large city which will contract to supply any kind of labor on short notice, while almost any of the large industrial corporations can either supply the normal demand with one-half or three-quarters of their plants, or recruit from the surplus labor around their various plants a skeleton organization which can resume operations in a short time.

The respective rights of employer, striker, and strikebreaker are matters which can not be solved by any method of cold reasoning, and should not be solved except by the force of public opinion acting either directly or through the medium of their representatives. In such matters we feel that our action can extend no further than the analysis of the issues, the presentation of the pertinent facts, and the expression of such general opinions as we may have reached.

We are convinced, however, that a modification of the legislative and judicial attitude on this question is necessary, and also that in the minds of the public a more general appreciation of the contentions of the workers is already taking place.

A general exception to this may perhaps exist in the case of public utilities, including not only the services which are commonly included, but the supply of milk, ice, and other similar necessities. The absolute dependence of the population of modern cities upon the noninterruption of such services has created a widespread public

demand for action which will insure them under all conditions. The public may good-humoredly walk during a street-car strike, but the interruption of the supply of food, fuel, and ice produces an attitude of public desperation. We confess that, under present conditions, no absolute insurance against its interruption by industrial disputes seems practicable. As long, certainly, as these services are performed by private corporations, the right of employees to strike should not and can not constitutionally be abrogated or abridged. Even under Government ownership and operation the problem is only slightly altered by the removal of the incentive of private profit for the maintenance of improper labor conditions, while cooperative operation is too vague even for analysis. At present proper action seems to consist in providing, first, for the most effective possible means for conciliation, investigation, and arbitration; second, for the use of all the leverage of public opinion to promote reasonableness on the part of those involved in the dispute; and, finally, for the plan as outlined elsewhere for defining clearly the rights of the parties to the dispute and the impartial but firm enforcement of such rights.

(d) The greatest disorders and most acute outbreaks of violence in connection with industrial disputes arise from the violation of what are considered to be fundamental rights, and from the perversion or subversion of governmental institutions.

This source of acute unrest has been discussed at length in a preceding section, so that at this point it is necessary only to summarize briefly its commonest manifestations, and to state that even the limited investigations which the commission has been able to make show that practically every industrial State has at some relatively recent time permitted its institutions to be used by one party or the other to an industrial dispute (almost without exception the employers) in such a way that the rights of the other party were either nullified or seriously transgressed.

It may be said that every governmental institution and function has been at some time utilized by the stronger industrial factor for the oppression and suppression of the weaker, but those which are most commonly utilized are, first, the police, including not only the municipal police, the sheriffs and deputies, the State police and constabulary, and the militia, but the private guards, detectives, and vigilante organizations, which usurp and exercise the functions of the police. The biased action of the State and municipal police seldom extends beyond the making of unwarranted arrests, the enforcement of unreasonable rules regarding such matters as picketing and public assemblage, and the use of excessive brutality. The State and municipal police are uniformly paid by the public and such control over their action as exists is generally indirect. In the case of the other bodies mentioned the control is frequently direct and their action frankly and bitterly partisan. The sheriffs in many counties deputize guards in the employment and pay of corporations, without any qualifications and sometimes even without knowing their names. Similarly the militia are at times recruited from the guards and other employees of corporations. The private guards, detectives, and vigilantes are openly partisan and can have no other purpose in connection with a strike than to break it with such means as they can command.

The police would, however, be much less effective if their control in a given locality did not usually imply also control of all or part of the local courts to give a legal sanction to lawlessness, to protect those who are criminally liable, and to exercise their full rigor in the prosecution of the strikers. Such controlled courts have not only found it possible through the use of blanket injunctions to make illegal acts which would otherwise be legal, but, resting upon their protection, the police, the deputies, the militia, and the private guards have in many cases felt free to go to unbelievable lengths in order to carry out their plans.

The subserviency of the courts in many parts of the country can not be more clearly shown than by the fact that they have time and again permitted the militia, under color of so-called martial law, to usurp their functions and to defy their associations who resisted the encroachment. The situation is accentuated also by the fact that the decisions of such corrupt and subservient courts become the basis upon which later honest "record worshipping" judges form their own opinions.¹

When governmental institutions are thus corrupted and used as instruments of oppression men can only resist with such power as they have, not alone for the protection of themselves and their families but for the preservation of the fundamental rights of themselves and their fellow citizens. Resistance to the usurpers of governmental power and to those who pervert to base uses the official power with which they are clothed was made the keystone of the American Nation, and Abraham Lincoln, on a most solemn occasion, said:

If by the mere force of numbers a majority should deprive a minority of any clearly written constitutional right, it might, in a moral point of view, justify revolution—certainly would if such a right were a vital one.²

The grave danger in the United States is that on account of the enormous area and the sense of isolation of each section as regards the others, the encroachment upon fundamental rights and the subversion of local governments will be permitted to gain ground without the effective protest of the entire Nation until the liberties of all citizens are hanging in the balance.

STATE CONSTABULARY.

6. The commission devoted a great deal of attention to the question of a State constabulary as a method of policing industry. Extensive investigations of the organization, personnel, and activities of the Pennsylvania State Constabulary were made and a number of witnesses were heard at length. The findings with regard to this particular police organization may be briefly stated: It is an extremely efficient force for crushing strikes, but it is not successful in preventing violence in connection with strikes, in maintaining the legal and civil rights of the parties to the dispute, nor in protecting the public. On the contrary, violence seems to increase rather than diminish when the constabulary is brought into an industrial dis-

¹ See report of B. F. Moore: Application of Writ of Habeas Corpus in Labor and Nonlabor Cases.

² Inaugural address, Mar. 4, 1861.

pute; the legal and civil rights of the workers have on numerous occasions been violated by the constabulary; and citizens not in any way connected with the dispute and innocent of any interference with the constabulary have been brutally treated, and in one case shot down by members of the constabulary, who have escaped punishment for their acts. Organized upon a strictly military basis, it appears to assume in taking the field in connection with a strike that the strikers are its enemies and the enemies of the State, and that a campaign should be waged against them as such.

There are certain features of the State police system, however, which seem to be preferable to the present haphazard methods of policing strikes. It is desirable, first, that all kinds of police should receive their entire compensation from the State; second, an organized force, whose records are known, is preferable both to the private police of corporations and to the deputies ordinarily sworn in by sheriffs; third, it is desirable that the force should be strictly disciplined and subject to definite orders; fourth, it is desirable that those in command of any police force should have a reasonable secure tenure of office and should have had previous experience under similar circumstances, as an inexperienced person is likely to become panic stricken by the mere presence of crowds, regardless of their actions.

If these desirable features could be combined with other features which would insure their impartiality during industrial disputes, and raise their ideals from the present militaristic basis to the police basis of preserving the peace and protecting the rights of both parties and the public, the establishment of State police systems for use in connection with industrial disputes might be recommended. But under present conditions, it seems desirable rather to leave the State policing of industrial disputes to the sheriffs and the militia if the restrictions hereinafter suggested are rigidly enforced so as to protect both the organization and the personnel from partisanship.

FREE SPEECH.

7. One of the greatest sources of social unrest and bitterness has been the attitude of the police toward public speaking. On numerous occasions in every part of the country the police of cities and towns have, either arbitrarily or under the cloak of a traffic ordinance, interfered with or prohibited public speaking, both in the open and in halls, by persons connected with organizations of which the police or those from whom they receive their orders did not approve. In many instances such interference has been carried out with a degree of brutality which would be incredible if it were not vouched for by reliable witnesses. Bloody riots frequently have accompanied such interference, and large numbers of persons have been arrested for acts of which they were innocent or which were committed under the extreme provocation of brutal treatment of police or private citizens.

In some cases this suppression of free speech seems to have been the result of sheer brutality and wanton mischief, but in the majority of cases it undoubtedly is the result of a belief by the police or their superiors that they were "supporting and defending the Govern-

ment" by such an invasion of personal rights. There could be no greater error. Such action strikes at the very foundation of government. It is axiomatic that a government which can be maintained only by the suppression of criticism should not be maintained. Furthermore, it is the lesson of history that attempts to suppress ideas result only in their more rapid propagation.

Not only should every barrier to the freedom of speech be removed, as long as it is kept within the bounds of decency and as long as the penalties for libel can be invoked, but every reasonable opportunity should be afforded for the expression of ideas and the public criticism of social institutions. The experience of Police Commissioner Woods, of New York City, as contained in his testimony before this commission, is convincing evidence of the good results which follow such a policy. Mr. Woods testified that when he became commissioner of police he found in force a policy of rigid suppression of radical street meetings, with the result that riots were frequent and bitter hatred of the police was widespread. He adopted a policy of not only permitting public meetings at all places where traffic and the public convenience would not be interfered with, but instructing the police to protect speakers from molestation; as a result, the rioting entirely ceased, the street meetings became more orderly, and the speakers were more restrained in their utterances.

It is suggested that the commission recommend as measures designed not only to remove the causes which lead to violence but to promote the impartial and effective action of police during disputes:

1. The enactment by Congress of a statute prohibiting, under severe penalties, the transportation of men from State to State, either under arms or for the purpose of arming them, as guards or as agents either of employers or of employees.

2. The enactment by Congress of a statute prohibiting the shipment in interstate commerce of cannon, gatling guns, and other guns of similar character, which are not capable of personal use, when consigned to anyone except military agencies of the State or Federal Governments.

3. The regulation or prohibition of private detective agencies and private employment agencies as hereinbefore suggested.

4. The strict enforcement in all public and private employment offices of the rules requiring full notice of the existence of a strike.

5. The complete assumption by the States and municipalities of the responsibility for policing, and the prohibition of the maintenance of any private police (except a limited number of watchmen without police power except on premises).

6. The definition by statute, by the States, of the conditions under which sheriffs may deputize, such regulations to include provisions that a deputy must be a bona fide resident of the State, that a sworn statement of the complete activities of each deputy covering a period of 10 years immediately preceding his deputation shall be filed with the secretary of state, that no person who shall have been convicted of any misdemeanor or who shall have been imprisoned in any State shall be deputized, and that no deputy shall receive any money or any other thing of value from any person connected with an industrial dispute during his period of service or in connection therewith.

7. The enactment of statutes, by the States, providing a uniform code governing the militia and embodying the following principles:

(a) A proclamation of martial law or a state of war, insurrection, or rebellion, by the governor of a State, as the result of an industrial dispute, shall have no effect upon the continuance of constitutional guaranties of the State and Federal Constitutions, nor upon the law and statutes, nor upon the jurisdiction of the courts, nor upon other civil authorities.

(b) The writ of habeas corpus or other process of the courts can not be suspended, interfered with, nor disregarded by the military. It is part of the duty of the military to assist in enforcing the process and decrees of the civil courts.

(c) The ordinary courts shall have exclusive jurisdiction for the punishment of crime, and in all cases where the same act constitutes an indictable offense under both military and criminal law, court-martials shall have no jurisdiction nor authority to try officers or soldiers accused thereof, but the offender shall be turned over to the civil magistrate for trial.

(d) The military may not hold, detain, nor imprison persons arrested by them any longer than is necessary to hand them over to the civil authorities. No person arrested by the militia shall be detained after noon of the following day without being brought before a committing magistrate.

(e) The military may not forcibly enter nor search a private house in order to seize arms or other property concealed therein without a search warrant.

(f) The military shall have no authority to establish a censorship over the press nor to interfere with the publication of newspapers, pamphlets, handbills, or the exercise of the right of free speech, except under process of the courts.

(g) The military shall not limit, restrict, nor interfere with the freedom of movement of peaceable citizens or the rights of public meeting, assemblage, or parades in streets and public highways or elsewhere, except under due process of law.

(h) Every military officer under whose orders a civilian is arrested shall within 24 hours thereafter report in writing to the commanding officer the name of the prisoner, the offense with which he is charged, and what disposition has been made of him. Failing, he shall be liable to such punishment as a court-martial may direct.

(i) In times of industrial disputes no private guards, detectives, nor employees of either of the contending parties shall be enlisted or employed as members of the militia, and all persons found by the commanding officer to be in the employment of either party to a dispute or actuated by animosity or personal ill will toward either of the contending parties shall be forthwith released from active service.

(j) The governor may, in times of disturbance, by proclamation forbid the sale or transportation of firearms, ammunition, and intoxicating liquors, and may require all firearms and other weapons to be deposited with the military at certain places, receipts being given therefor. Proper search warrants may be issued to discover concealed weapons.

8. That the States and municipalities should provide by law for the fullest use of schools and other public buildings for public meetings and lectures and for other similar purposes.

X. THE CONDITIONS AND PROBLEMS OF MIGRATORY LABORERS.

It has been found as a result of the commission's investigations, which were made chiefly by Mr. P. A. Speek:

1. There are large numbers of American workers, in all probability several millions, who are not definitely attached either to any particular locality or to any line of industry. These migratory workers are continually moving from one part of the country to another as opportunity for employment is presented.

The great movements of these workers are seasonal in character, as, for example, the movement of harvest hands during the summer and autumn, the movement to the lumber and ice camps in the winter, and the movement to the construction camps in the spring and summer. In addition there are large, irregular movements of laborers which are produced by the depression in different trades and localities, and movements due to false rumors about opportunities and to the men's acquired habits of migration.

2. The number of these migratory workers seems to be increasing not only absolutely but relatively. There are no available figures to show this conclusively, but it is the general opinion of students of the subject and of the migratory workers themselves that a rapid increase in their number is taking place.

3. A considerable proportion of these migratory workers are, unquestionably, led to adopt this kind of a life by reason of personal characteristics or weaknesses, and these personal weaknesses are accentuated rather than diminished by the conditions under which they live and work. Nevertheless, even if the migratory workers were all men of the highest character and reliability, there would still be a demand from our industries for the movement of the population in almost as great numbers as at present, in order to supply seasonal demands and to take care of the fluctuations of business.

4. An increasingly large number of laborers go downward instead of upward. Young men, full of ambition and high hopes for the future, start their life as workers, but meeting failure after failure in establishing themselves in some trade or calling, their ambitions and hopes go to pieces, and they gradually sink into the ranks of migratory and casual workers. Continuing their existence in these ranks, they begin to lose self-respect and become "hoboes." Afterwards, acquiring certain negative habits, as those of drinking and begging, and losing all self-control, self-respect, and desire to work, they become "down-and-outs"—tramps, bums, vagabonds, gamblers, pick-pockets, yeggmen, and other petty criminals—in short, public parasites, the number of whom seems to be growing faster than the general population.

5. The movement of these migratory workers, at the present time, is practically unorganized and unregulated. Workmen in large numbers go long distances in the hope of finding employment on the basis of a mere rumor, and frequently find that there is either no work or work for only a few. At the same time the demand for labor in a given locality or industry remains unfilled, because the workers have failed to hear of the opportunity. In fact, a large part of the movement of migratory workers at present is determined not by the demands of industry for labor, but by the necessity to search for work.

To illustrate: A man finds himself out of work in a given locality because of the termination of the busy season, because of business depression, or because of his personal discharge; he is unable to secure employment in the locality, and he has no information regarding opportunity for work elsewhere. If he remains in the locality he is almost certain to be arrested as a vagrant. His only recourse is to start moving, and the direction of the movement is usually determined by chance.

6. The attempts to regulate the movements of migratory workers by local organizations have, without exception, proved failures. This must necessarily be true no matter how well planned or well managed such local organizations may be.

7. The problem can not be handled except on a national scale and by methods and machinery which are proportioned to the enormous size and complexity of the problem.

The basic industries of the country, including agriculture and railroad construction work, are absolutely dependent upon these migratory workers.

8. The conditions under which migratory workers live, both in the cities and at their places of employment, are such as to inevitably weaken their character and physique, to make them carriers of disease, and to create in them a habit of unsteadiness and migration.

The provisions for housing and feeding workers in the labor camps are subject to severe criticism, while the lodging houses in the large cities are even worse, especially from the viewpoint of morals. One season spent in a city lodging house is generally sufficient to weaken the physique and destroy the moral fiber of even the strongest man. Numerous instances of the spread of dangerous diseases by migratory workers also have been brought to the notice of the commission.

9. The available information indicates clearly that even the most perfect distribution of workers, in accordance with the opportunities afforded at present by American industries, will still leave enormous numbers unemployed during certain seasons of the year and during periods of industrial depression.

10. The congregation of large numbers of migratory workers in large cities during the winter should be avoided, if possible, not only because they are an unjust burden upon the cities but because of the degenerating effects of city life during long periods of idleness.

11. The movement of migratory and seasonal workers is caused chiefly by the seasonal demand of industries and by the men's search for work, and, to a degree, by their aimless desire to move about. The conditions of their transportation have become grave. Millions of men annually have to, and are allowed to, resort to such a method of movement as stealing rides on the railways. This method of transportation results in the demoralization and casualization of workers, in their congestion in industrial and railway centers, in waste of their time and energy, in frequent bodily injuries and numerous fatal accidents and homicides annually, while, at the same time, it serves but poorly the industrial demand for help.

12. When the workers return to the city, from labor camps, for instance, either to rest or to spend the time between seasons, they not only meet the unhealthy and demoralizing influence of cheap lodging

houses, saloons, houses of prostitution, and other similar establishments in the slums, but they fall easy prey to gamblers, small private bankers, and all sorts of parasites. As a result, what earnings they have left after deduction of their living expenses at work places rapidly disappear, no matter how large these earnings may be.

The principal recommendations for dealing with the problem of migratory workers are outlined under the head of unemployment. In this immediate connection, however, it seems desirable to suggest three necessary measures:

1. The Interstate Commerce Commission should be directed by Congress to investigate and report the most feasible plan of providing for the transportation of workers at the lowest reasonable rates and, at the same time, measures necessary to eliminate the stealing of rides on railways.

If special transportation rates for workers are provided, tickets may be issued only to those who secure employment through public employment exchanges.

2. The establishment by States, municipalities and, through the Department of Labor, the Federal Government, of sanitary workingmen's hotels in which the prices for accommodation shall be adjusted to the cost of operation. If such workingmen's hotels are established, the Post Office Department should establish branch postal savings banks in connection therewith.

3. The establishment by the municipal, State, and Federal Governments of colonies or farms for "down and outs," in order to rehabilitate them by means of proper food, regular habits of living, and regular work that will train them for lives of usefulness. Such colonies should provide for hospital treatment of cases which require it.

XI. UNEMPLOYMENT.

The extent and character of unemployment has been briefly presented in a previous section, but the discussion there dealt only with the larger aspects of the situation in general terms. It remains to present at this point, in summary fashion, the findings which have resulted from the extensive investigations which have been conducted for the commission, principally under the direction of Dr. William M. Leiserson, together with certain specific recommendations relating to the organization of the labor market and the regularization of employment.

EXTENT AND CHARACTER OF UNEMPLOYMENT.

1. Wage earners in the principal manufacturing and mining industries in the United States lose on the average from one-fifth to one-fourth of the working time during the normal year.

This is the conclusion indicated by an examination of practically all of the published material, and of the hearings of the commission, relating to loss of time, irregularity of employment, and unemployment.

2. Excluding the extremely seasonal industries, such as canning, harvesting, lumber cutting and logging, which operate normally only a part of the year, the amount of lost working time varies

greatly for workers in different industries and in different occupations and trades. Loss of time appears to be greatest in bituminous coal mining, iron and steel manufacturing, leather, woolen and worsted clothing, slaughtering and meat packing, and in other industries where the proportion of unskilled labor is large.

3. It has been found that the lowest-paid worker is subject to the greatest loss in working time, not simply because he is unskilled but also because he is poorly nourished and weakened by the effects of unfavorable conditions of living and, in many instances, by unbearably severe conditions of work.

The tendency in the evolution of modern industry toward the employment of a larger proportion of unskilled labor, as well as the fact that many industries have come into existence because of the availability of a supply of casual laborers and of woman and child workers who are willing to work for less than subsistence wages, points to a greater degree of irregularity of employment, unemployment, and loss of working time, than ever before.

4. The actual number or proportion of workers at any given time who are unable to work can not be estimated, because of the lack of adequate data in this country. Recent investigations by Federal authorities and the statements of competent authorities before the commission, however, prove beyond doubt that the number of unemployed persons even in normal times is appallingly great. The statistics of highly organized trades show that even in times of greatest industrial activity there is a considerable percentage, ranging from 7 to 15 per cent of all of the members of unions in different trades and industries, of workers who are unemployed during the year. In any year the unemployed who congregate in the large cities alone during the winter months number several hundred thousand, while in years of industrial depression the number of unemployed in the entire country is at least three million.

5. The loss in working time is of two principal classes: Lack of work and sickness. Lack of work, which may mean the inability of the worker to find employment as well as the absence of a demand for labor of any particular kind or even of all kinds, either in a locality or section or in the country as a whole, accounts for approximately two-thirds of the average worker's loss of time at work, according to the available data on this point; ill health, according to several intensive investigations of wage workers and their families and the examination of the sick records of nearly a million wage earners in this country, accounts for approximately one-fourth of the loss in working time. Strikes appear to be the cause of less than two per cent of the loss in working time, and accidents are the cause in about the same proportion.

6. In addition to the two basic causes of unemployment—unjust distribution of income and land monopolization—which were analyzed in detail in an earlier section of the report, the following causes demand attention:

(a) Evolutionary changes in industry and in social habits and movements which affect the character and the extent of the demand for labor as well as the character and the quantity of the supply of labor. These include changes in industrial structure and methods—such as the increase or decrease in the demand for labor in certain industries and localities, the introduction of machinery and new

processes, and the changes in the character of the demand for labor—and changes in the organization of industry. The character and quantity of the supply of labor have been affected by immigration and by the entrance into industry of women workers, both of which factors have caused an increase in the supply of cheap and unskilled labor. To some extent, however, the labor supply is fluid because of the ease with which considerable proportions of immigrants can withdraw from the labor market by returning to their homes in times of industrial inactivity.

(b) Variations in the demand for labor due to fluctuations and irregularities in industry. Industrial fluctuations may be classed as cyclical and seasonal. Cyclical fluctuations result from business depressions and at times double the amount of loss of time during a year, which is illustrated by the fact that the railroads employed 236,000 fewer men in 1908 than in 1907. Seasonal fluctuations may either be inappreciable, as in municipal utilities, or may displace nearly the entire labor force. The seasonal fluctuations in the canning industry in California, for example, involve nearly nine-tenths of all the workers; in logging camps, which depend upon the snow, operations are practically suspended in summer; while in the brick and tile industry only 36.5 per cent of the total number of employees are retained during the dull season. Irregularities in the conduct of industry and in the method of employing labor are evident in dock work, in the unskilled work in iron and steel, and in slaughtering and meat packing; in the competitive conditions in industries which force employers to cut labor cost down to the utmost and to close down in order to save operating expenses; in speculative practices which result in the piling up of orders and alternate periods of rush production and inactivity; in loss of time due to inefficient management within plants. In some cases it has been charged although without definite proof, that irregularity of employment is due to a deliberate policy of employers in order to lessen the chance of organized movement, as well as to keep the level of wages down in unskilled occupations by continually hiring new individuals.

(c) Conditions determining the worker's ability to grasp or retain the opportunity to be employed which industry offers. Among these conditions are ill health, old age, deficiencies in industrial training, lack of facilities by which the worker and the job can be brought together, factors causing immobility in the labor supply and its inability to adjust itself to changes in the character of the demand for labor, and those personal factors, such as dishonesty, laziness, intemperance, irregularity, shiftlessness and stupidity, which are commonly included under the term "deficiencies of character." By no means are all of these conditions under the control of the worker; in fact, the further investigation goes the greater appears the responsibility which society and the employer bear for the conditions that determine the worker's ability to retain whatever employment industry is able to offer regularly.

7. The effects of the loss in working time and the attendant irregularity of employment may be summed up in the term "the workers' economic insecurity." Specifically the effects, as shown by a study of the results of various investigations and by testimony before the commission, may be summarized as follows:

(a) Actual loss of earnings, which in turn results in the necessity for the supplementing of family income by the earnings of women and children, and by payments from boarders and lodgers whose presence is inimical to family life.

(b) The depression of the wage level, in some instances, and the preventing of higher wages.

(c) Waste in expenditure, due to irregularity of family income.

(d) Deleterious effects upon the worker, such as demoralization, worry, loss of skill, irregularity of habits, etc.

(e) The gradual loss of economic status by workers who are thrown out of employment and the inevitable drift of a large proportion into the class ordinarily known as "casual laborers," the constant recruiting of the large army of dependents and delinquents who compose the unemployables, and the general loss of national efficiency that so great a number of incapable citizens must entail.

(f) The existence of a supply of casual laborers and irregularly employed women and children, upon which parasitic industries, unable to exist unless they pay wages below the standard of decent subsistence, are called into being.

EXISTING CONDITIONS OF EMPLOYMENT.

8. In addition to the large variations which affect entire industries, there is an ever present and equally difficult problem in the unsteadiness of employment. The existing methods of hiring and discharging employees, and the constant changing of positions by the workers themselves, divide the work among a much larger number of employees than are actually needed. Instead of one person being employed where there is work for but one, several are hired during the course of the year to occupy the same position. Thus an investigation of the cloak and suit industry of New York showed that the maximum number of employees in 16 occupations during any week of the year was 1,952. Actually, however, the pay rolls showed that 4,000 people were employed in these occupations. This "turnover" of the labor force, the constant shifting from job to job, the dropping and hiring of men, is peculiar to no industry. It is found everywhere, among women as well as men, and it is a kind of irregularity of employment that is a constant factor. A large mail-order house which began the year with about 10,500 employees and ended with about the same number, engaged during that year 8,841 people in order to maintain their force. A manufacturing establishment employing in 1913 an average of 7,200 people, hired 6,980 during that year. An automobile factory was reported in 1912 to have hired 21,000 employees in order to maintain an operating force of 10,000. A large steel plant employing about 15,000 men hires normally an equal number to maintain that force. During the years when it wanted to increase the force three and one-half times as many were hired as were actually needed to make up the increase. In some lumber camps and sawmills on the Pacific coast all men are discharged twice a year, in July and December, and complete new forces are hired when work is resumed. In the logging camps it is customary to hire five men in the course of the season to keep one job filled.

A manager of a large electrical works made a study of a group of representative factories (large, small, and medium) in the mechanical industries and found that to increase their working force by 8,128 people in the year 1912, they actually hired 44,365 people; that is to say, five and one-half times the number actually needed to make up the increase were hired and 36,237 were dropped from the rolls for one reason or another.

9. Detailed investigations show that a majority of the employees dropped from the pay rolls leave of their own accord. But there is no doubt that many of them leave because they were hired to do work for which they were unfitted; and many others, without actually being discharged, leave because work is slack or threatens to become slack. In the lower paid and more disagreeable jobs there is almost a constant shifting of employees because no one works at these jobs except during those periods when he is helpless and can get no other work. Whatever the reason is for the men quitting, there is no doubt that conditions of employment and methods of hiring and discharging employees have very much to do with causing a large "turnover" of the labor forces. Those employers who have given attention to this question of hiring and discharge have been able to reduce the "turnover" very greatly, and thus make employment more steady.

10. The problem of unemployment has never received adequate attention, apparently because it has been believed generally that it affected only a small part of the working population. Such a belief is absolutely false. Not only is practically every wage earner in constant dread of unemployment, but there are few who do not suffer bitterly many times in their career because they are unable to get work. Every year from 15,000 to 18,000 business enterprises fail and turn their employees out; every year new machinery and improved processes displace thousands; cold weather and wet weather and hot weather stop operations and force wage-earners into idleness; and where there are not these natural causes there are the customs and habits and holiday rushes which result in overwork followed by underemployment. Employers change the locations of their plants and conditions of credit and currency cause depressions and shut-downs and short-time and part-time work. Constantly the methods of hiring and discharging employees are causing people to be dropped from the pay rolls. All these facts in connection with the conservative figures of fluctuation in the amount of employment prove that "the unemployed" eventually include practically every wage-earner, and not alone a surplus portion.

11. Practically all wage-earners are affected by the fluctuations of industry. To count the number of the unemployed at any given time becomes almost impossible, since the number is changing from day to day. The unemployed of to-day are the workers of to-morrow, and vice versa.

The permanently unemployed are really people who have dropped out of the ranks of industry, broken down by the unsteadiness of employment or other causes. Some are mentally defective or physically incapable or both. Others are "down and outs," who have lost the habit of working. Still others live by their wits, by begging, or by crime. During the most prosperous times, when labor is in great demand, these same people do not work. They are "unem-

ployed" in the same sense that young children, the old, and the sick, and those who live on incomes from investments, are unemployed. No amount of work that might be provided by public or private enterprise would have any appreciable effect on these unemployables. They need hospital or corrective treatment. In prosperous times they are considered the subjects of such treatment, but in every period of industrial depression they stand out as the most conspicuous element in the "army of the unemployed."

The failure to distinguish these unemployables from those who are temporarily out of work on account of a slack season or the failure of a firm and those casual workers who are employed for part of every week or month, leads to hopeless confusion.

12. The fluctuations in business affect capital as well as labor, but the result is entirely different. Capital suffers the same fluctuations and every industry has its "peak loads." The essential differences are, first, that a fair return on investments is estimated by the year, while for labor it has become more and more customary to hire and pay and discharge by the week, day, or hour, or by the piece, and, second, that while capital can offset the fat years against the lean, the human beings who are unemployed can not, but must starve or suffer a rapid physical and moral deterioration. The result is that unless the wage earners are very strongly organized—and the vast majority are not—they must bear the whole burden of the waiting period when they must act as a reserve force ready to meet the maximum demand of the busy season. We do not consider policemen unemployed when they are not arresting violators of the peace, and we do not consider firemen out of work when they sit in the fire-houses prepared to do their duty. But for most working people industry is still conducted on a sort of volunteer fire department basis. In the busy seasons and prosperous years all are desirable and useful citizens. At other times they are useless and worthless, so far as our industries are concerned. They are turned adrift to take care of themselves and those dependent on them as best they can.

EXISTING AGENCIES FOR EMPLOYMENT.

13. The first step in any intelligent attempt to deal with the problem is the organization of the labor market on a systematic business-like and efficient basis.

14. Labor exchanges can not create work nor make the existing irregular demand for labor steady the year through, but they can, if properly managed, remove the unnecessary loss of time which workers now suffer in passing from one job to the next; they can eliminate the numberless evils which now characterize private employment offices; and they can provide the information and administrative machinery which is essential to every other step in dealing with the problem.

15. The absurdity and waste which characterizes the existing system of marketing labor can best be appreciated by imagining the condition which would be produced if every manufacturer who needed lathes, drill presses, planers, and milling machines advertised for them in the papers, and many machines were sent to him, out of which he could pick the few he wanted. Yet that is exactly what happens when machine hands, human beings, are wanted;

when the calls go out for harvest hands or when any other class of labor is advertised for. No one knows how many will answer the advertisement. Many more than the number needed respond to the calls. The waste of time, energy, car fare, and railroad fare to get to the places is enormous. Often men quit positions in the hope of getting the alluringly advertised work. Many employers do not even advertise. They simply hang the "Help wanted" sign at the door and depend on people to walk the streets and watch for these signs.

16. Wherever systematic methods and intelligent organization and direction are lacking, there evils creep in to add to the chaos. That is exactly what we find has happened in the labor market. The saloon becomes one of the most important places in the country to get information about jobs. Pool rooms, cafés, grocery stores, lodging houses, even street corners and public parks become improvised labor markets. In these places many and strange abuses are met with. Groundless rumors send people scurrying over the city and the country on a wild-goose chase. One job seeker sells information to another, and quite often it is false or misleading. Foremen sell real or bogus jobs under their control. Fees for jobs are paid by buying drinks, and "man catchers" pick up victims to rob or abuse.

17. Of all the evils, the wild rumors regarding available jobs are the greatest. These evils are increased by fake "want ads" in the newspapers, untruthful or innocently misleading advertisements for help, and new stories intended to boost towns or industries or to attract large supplies of labor. Investigators and men who were sent to answer "want ads" found many of these inserted by employment agents who had no jobs to offer but who wanted to collect registration fees. Other advertisements were pure fakes, inserted by "white slavers," bogus real estate and stock brokers, selling agents of "new propositions," padrones, and other swindlers. A study of newspaper want advertisements made a few years ago revealed that when times are good one-fourth or more are "fake ads," while in hard times more than one-half are in this class.

18. Private enterprise has attempted to deal with the situation through the establishment of employment agencies which gather information regarding opportunities for employment and sell the information to work seekers and, under certain conditions, collect fees also from employers. The number of private employment agents varies greatly from year to year, but there must be from 3,000 to 5,000 of these labor middlemen in the country.

Investigations show, however, that instead of relieving unemployment and reducing irregularity, these employment agencies actually serve to congest the labor market and to increase idleness and irregularity of employment. They are interested primarily in the fees they can earn, and if they can earn more by bringing workers to an already overcrowded city, they do so. Again, it is an almost universal custom among private employment agents to fill vacancies by putting in them people who are working at other places. In this way new vacancies are created and more fees can be earned.

19. They also fail to meet the problem because they are so numerous and are necessarily competitive. With few exceptions, there is no cooperation among them. This difficulty is further emphasized by the necessity of paying the registration fees required by many

agencies; obviously the laborer can not apply to very many if he has to pay a dollar at each one.

20. The fees which private employment offices must charge are barriers which prevent the proper flow of labor into the channels where it is needed and are a direct influence in keeping men idle. In the summer, when employment is plentiful, the fees are as low as 25 cents, and men are even referred to work free of charge. But this must necessarily be made up in the winter, when work is scarce. At such times, when men need work most badly, the private employment offices put up their fees and keep the unemployed from going to work until they can pay \$2, \$3, \$5, and even \$10 and more for their jobs. This necessity of paying for the privilege of going to work, and paying more the more urgently the job is needed, not only keeps people unnecessarily unemployed, but seems foreign to the spirit of American freedom and opportunity.

21. An additional injustice inevitably connected with labor agencies which charge fees is that they must place the entire cost of the service upon those least able to bear it. Employment agents say that employers will not pay the fees; hence they must charge the employees. Among the wage earners, too, however, those who are least in need and can wait for work, pay the least for jobs and even get them free, while those who are most in need make up for all the rest and pay the highest fees. The weakest and poorest classes of wage earners are therefore made to pay the largest share for a service rendered to employers, to workers, and to the public as well.

22. The fees paid private employment agents in California in the license year ending March 31, 1912, amounted to \$403,000. Using these figures as a rough basis, the fees for the country as a whole amount annually to \$15,000,000. This enormous sum of money, which is being paid chiefly out of the meager earnings of domestic servants, clerks, and unskilled laborers, would be enough to support a system of public exchanges which would bring order out of the existing chaos.

23. There are many private employment agents who try to conduct their business honestly, but they are the exception rather than the rule. The business as a whole reeks with fraud, extortion, and flagrant abuses of every kind. The most common evils are as follows:

Fees are often charged out of all proportion to the service rendered. We know of cases where \$5, \$9, \$10, and even \$16 apiece has been paid for jobs at common labor. In one city the fees paid by scrubwomen is at the rate of \$24 a year for their poorly paid work. Then there is discrimination in the charges made for the same jobs. Often, too, men are sent a long distance, made to pay fees and transportation, only to find that no one at that place ordered men from the employment agent. A most pernicious practice is the collusion with foremen or superintendents by which the employment agent "splits fees" with them. That is, the foreman agrees to hire men of a certain employment agent on condition that one-fourth or one-half of every fee collected from men whom he hires be given to him. This leads the foreman to discharge men constantly in order to have more men hired through the agent and more fees collected. It develops the "three-gang" method so universally complained of by railroad and construction laborers,

namely, one gang working, another coming to work from the employment agent, and a third going back to the city.

Finally, there is the most frequent abuse—misrepresentation of terms and condition of employment. Men are told that they will get more wages than are actually paid, or that the work will last longer than it actually will, or that there is a boarding house when there really is an insanitary camp, or that the cost of transportation will be paid, when it is to be deducted from the wages. They are not told of other deductions that will be made from wages; they are not informed about strikes that may be on at the places to which they are sent, nor about other important facts which they ought to know. These misrepresentations, it must be said, are often as much the fault of the employer as of the labor agent. Also the employer will place his call for help with several agents, and each will send enough to fill the whole order, causing many to find no jobs. Labor agents and laborers alike are guilty of the misuse of free transportation furnished by employers to prospective help. And it is true also that many applicants perpetrate frauds on the labor agents themselves, as, for example, causing them to return fees when positions actually were secured. This is the result of the general feeling that the whole system of paying fees for jobs is unjust; and if they must pay in order to get work, then any attempt to get the fee back is justifiable.

24. Attempts to remove these abuses by regulation have been made in 31 States, but with few exceptions they have proved futile, and at most they have served only to promote a higher standard of honesty in the business and have not removed the other abuses which are inherent in the system. Where the States and cities have spent much money for inspectors and complaint adjusters there has been considerable improvement in the methods of private employment agencies, but most of the officers in charge of this regulation testify that the abuses are in "the nature of the business" and never can be entirely eliminated. They therefore favor the total abolition of private labor agencies. This is also the common opinion among working people, and in several States attempts have already been made to accomplish this by law.

25. It is significant that trade union members are practically never found among the applicants for charity during periods of unemployment. They may be unemployed, but they are in some way cared for, either by having work found for them or by systematic or voluntary relief. Within each strongly organized trade, it may be said, the problem of connecting man and job is cared for fairly well. The union headquarters is the most common labor market for organized workers. Ordinarily, no systematic employment business is done, but many unions have out-of-work books in which the unemployed write their names, and it is part of the duties of the business agent of every union to be on the lookout for vacancies and to notify members seeking employment of the opportunities. Many unions also have traveling benefits to assist members in going from place to place. But when it comes to placing men outside of their own trades the unions are not successful as employment offices.

Partly for this reason and partly for the reason that only a small part of the wage earners are in strongly organized trades, the trade unions occupy a minor place in the general labor market.

26. Within recent years associations of employers have established employment offices in all the important cities of the country. The movement is spreading very rapidly, and there is hardly an important industrial center in the country that has not a bureau of this kind. These offices are supported out of the funds of the employers' associations, and their services are free to working people. Most of them, however, do a very small employment business.

Almost all of these offices owe their origin to the movement among employers to establish and maintain the so-called "open shop" or the "antiunion shop." Since their establishment, employers have discovered that such offices are very useful also in creating central clearing houses for labor, "constituting the shortest cut between supply and demand." This, however, is not their primary purpose, for nowhere have they extended their operations to include common laborers, who suffer most from disorganization of the labor market. These bureaus are merely divisions of the regular business of the employers' associations, and one of the main purposes of these associations is to prevent the organization of their shops by trade-unions. The employment bureaus are established and maintained to further this purpose.

The employment bureaus maintained by employers' associations, therefore, not only are of no practical value as a means of solving the problem of unemployment, but, on the contrary, because they are organized primarily to prevent the employment of skilled workmen who are distasteful to their members, are actual barriers to the free movement of labor.

27. In every city there are religious and charitable organizations which attempt to find work for destitute persons. In connection with the charity societies of the larger cities, regular employment agencies are maintained, but very little business, comparatively, is done by these officers. Working people do not go to them, and employers do not call for employees at such offices, except occasionally for men to do odd jobs, or when they agree to place someone as a favor to the charity workers. The main work of the charitable employment offices is to find odd jobs for the unemployed who can not hold ordinary positions. They also help people handicapped by age, illness, or other physical or mental defect. Their primary purpose is charity. They may be said to have no effect whatever on employment conditions for able-bodied workers.

Until the State is ready and able to take proper care of its handicapped, diseased, and subnormal members, the charitable employment agencies and institutions will continue to be necessary, because labor exchanges properly organized on a business basis, whether by public or by private enterprise, can not deal with the handicapped classes of labor. Those who are physically or mentally unfit to hold positions should be sent to the places where they will get the relief they need and not to work which they would quit or from which they would be dismissed in a few days.

PUBLIC EMPLOYMENT AGENCIES.

28. In 1890 Ohio created the first public employment offices in this country. Since that time, such offices have been established in 23 other States, and they are now in operation in about 80 cities. Most

of them were created by State laws; a few are municipal enterprises. They represent an expense to the States and cities of about \$300,000 annually, and, according to their reports, they fill about 500,000 positions a year.

29. As a result of a very extensive investigation it has been found that the public employment offices of the United States, as a whole, are issuing inaccurate statistics. They are slipshod in recording information about employers and employees. They cater too much to casual laborers and "down-and-outs," thus driving away the better class of workers. Too many are poorly housed, with insufficient lighting and ventilation. They fail to supplant private agencies or to lessen their exploitation of workers. They do not exchange information even when closely located. They fail to bring themselves to public attention, either by advertising or otherwise, and they have failed to arouse public interest in their work. This is true of public employment offices taken as a whole, but there are some very bright exceptions. During the last few years, also, the labor departments have been devoting more attention to the work of public employment offices, and many improvements have resulted which show that the principles underlying the offices are sound, but that they have not been properly carried out.

30. The reasons for the failure of most of the public employment offices are:

First. The inefficiency and lack of training of the officials and clerks who operate the agencies. A public employment office must build up its work by soliciting business and giving service that is felt to be valuable; otherwise little attention will be paid to it. For this purpose men of judgment and experience are necessary to carry on the work. It is a technical business requiring not a mere shuffling of applications but careful selection of applicants and thorough understanding of the requirements of positions to which they are to be sent.

Second. The offices have generally been regarded as political spoils, with a consequent change of personnel after each election.

Third. The salaries have been inadequate to attract competent men.

Fourth. The public employment offices have been the objects of suspicion, if not of actual opposition, by employers and organized labor as well. Union men have feared that the offices might be used as strike-breaking agencies, or to lower wage rates. Employers, on the other hand, have feared that the offices might be used to fill their shops with union men and labor agitators.

The activities of the Federal Department of Labor in connection with unemployment have been chiefly attempts to utilize the existing machinery of the Bureau of Immigration and the Post Office Department for receiving the applications of men out of work, collecting information regarding opportunities for employment, and as far as possible referring idle men to opportunities for work. For this purpose the country has been divided into 18 zones, with a central office in each, which is in charge of an immigrant inspector. Applications from employers and employees are received either directly or through a special arrangement with the Post Office Department.

The statutory authority for the establishment of the system is contained in the act of 1907, creating a division of information in the Bureau of Immigration, broadened in scope by the act creating

the Department of Labor. The opportunity to establish the system arose through the great decrease in immigration, which left a large part of the resources of the Bureau of Immigration available for this purpose. The system was established only in March, 1915, and it can not properly be judged on the results of this very limited experience. The most promising feature of the entire system is the arrangement which has been made for close cooperation with the National Farm Labor Exchange, which has been organized by the labor commissioners of the States in the wheat belt. No such close cooperation has yet been established with any other public employment system and no effort has been made to regulate the abuses of the private exchanges which do business in two or more States.

The following observations regarding the present scheme of the Department of Labor seem to be proper:

(a) The system of zones and central offices is sound and affords a suitable framework for the development of the system.

(b) The operation of the system directly by the Bureau of Immigration is likely to deter a great many workmen from utilizing it, through a belief that it is intended only for immigrants.

(c) The employers have generally assumed an attitude of suspicion toward the Department of Labor, which forms a great handicap.

(d) The system does not yet provide for sufficiently close cooperation with the State and municipal employment offices.

(e) The system of registering applications does not provide for the close personal contact which is necessary to ascertain the requirements of the employer or to select the workman who is capable of filling such requirements. The success of every employment office depends upon this personal contact.

(f) The qualifications demanded in the examination of immigrant inspectors are not designed to secure men who are properly qualified to operate public employment offices.

(g) A national employment system should not have to depend upon the exigencies of the general immigration service.

(h) The system can not attain efficiency until provision is made for the regulation of private agencies which operate in two or more States.

(i) The successful operation of a national employment system can not be attained until provision is made for some form of cheap transportation, which will assure the prompt arrival of workers at points where they are needed and eliminate the present wasteful, dangerous, and demoralizing practice of workers riding on freight trains.

(j) In order to secure the confidence of both capital and labor, the creation of national and local advisory committees consisting of employers and employees is advisable. Such committees would also be of great assistance through their knowledge of the local industrial conditions.

It is suggested that the commission recommend:

1. The enactment of appropriate legislation modifying the title of the Bureau of Immigration to "Bureau of Immigration and Employment" and providing the statutory authority and appropriations necessary for—

(a) The establishment of a national employment system, under the Department of Labor, with a staff of well paid and specially qualified officials in the main offices at least.

(b) The licensing, regulation, and supervision of all private employment agencies doing an interstate business.

(c) The investigation and preparation of plans for the regularization of employment, the decasualization of labor, the utilization of public work to fill in periods of business depression, insurance against unemployment in such trades and industries as may seem desirable, and other measures designed to promote regularity and steadiness of employment.

2. The immediate creation of a special board made up of the properly qualified officials from the Departments of Agriculture, Commerce, Interior, and Labor and from the Board of Army Engineers to prepare plans for performing the largest possible amount of public work during the winter, and to devise a program for the future for performing during periods of depression such public work as road building, construction of public buildings, reforestation, irrigation, and drainage of swamps. The success attending the construction of the Panama Canal indicates the enormous national construction works which might be done to the advantage of the entire Nation during such periods of depression. Similar boards or commissions should be established in the various States and municipalities.

XII. ORGANIZATION, METHODS, AND POLICIES OF TRADE UNIONS.

The investigations of the commission conducted under the direction of Dr. George E. Barnett, are the basis of the following conclusions:

1. The number of trade unionists relative to the working population is steadily increasing, although in certain industries, on account of the opposition of the great corporations and hostile employers' associations, trade unionism is practically nonexistent. At present it may be roughly estimated that in manufacturing, mining, transportation, and the building industries, if the proprietary, supervisory, official, and clerical classes are excluded, 25 per cent of the workers 21 years of age and over are trade unionists.

2. The effects of trade unionism on wages are undoubted. Without some form of combination the wageworkers can not bargain on equal terms with their employers. During the past 15 years, a period of rapidly rising prices, wages in well-organized trades have kept pace with the rising cost of living, in contrast to the relative decline of the purchasing power of the wages received by labor generally.

3. In the well-organized trades the hours of labor have been steadily reduced until at present eight hours is the normal working day for at least one-half of American trade unionists. It is significant of the influence of trade unionism on the length of the working day that it is exactly in those trades in which the trade unionists are a relatively small part of the total working force that they work long hours relatively to other trade unionists.

4. As the unit of industry grows larger and the natural relation which exists between the small employer and his workmen disappears, the opportunity for unjustifiable discharges and petty tyrannies enlarges. The result is distrust and enmity among the employees. The effective remedy is the organization of the workers and the

establishment of a system of trade boards in which the workers are equally represented with power to deal with such questions.

5. By means of mutual insurance in case of death, sickness, accident, old age, and unemployment many trade unions have greatly improved the conditions of their members. The extension of such systems appears to be highly desirable.

6. The trade union is a democratic institution and faces the same problems in securing efficient government that other democratic institutions face. The theory of government which the American trade unions have adopted is the centralization of power in the national trade union as against the local unions. The successful carrying out of this plan of organization will eliminate the chief defects in trade union government. The control by the national union over strikes and the system of mutual insurance is already thoroughly established in the more important unions; it should be established in all other unions.

7. Unwarranted sympathetic strikes have undoubtedly been the cause of great annoyance and considerable economic loss to employers. The annoyance in such cases is particularly great, because no direct action by the employer can be taken; at best he can only use his influence with his associates or competitors. With the increasing control of the national officers over the local unions, this kind of strike seems to be decreasing both in extent and frequency. Such sympathetic action is deep-rooted in the sense of brotherhood which to a greater or less degree pervades and will not be completely eliminated until substantial justice exists throughout industry.

8. A few trade unions exclude qualified persons from membership by high initiation fees or other devices. This policy is condemned by the more important unions and is prohibited by their rules. The evidence presented to the commission shows clearly that the policy of exclusion is antisocial and monopolistic and should be given up by those unions which practice it.

9. In many trades the efficiency of the union depends upon the maintenance of the rule that all those working at the trade shall become members of the union. Where the union admits all qualified workers to membership, under reasonable conditions, such a rule can not become the basis of monopoly, and neither the rights of the individual nor the public interest are infringed by its enforcement.

10. In some trades there are a considerable number of union rules which restrict the productivity of the worker. Some of these rules can be justified on the ground that they are necessary to the protection of the health of the worker. There are some, however, which can not be defended; these rules are antisocial and should be given up. Experience has shown that where industry is regulated by well-organized systems of joint agreements, such rules either disappear or greatly decrease in number and importance. These limitations of output should not, however, be considered as standing alone. The limitations of output by associations of employers and by individual corporations are equally antisocial and have far greater consequence.

11. Jurisdictional disputes are the occasion of frequent and costly strikes. The disputes of this character which have caused most injury are in the building trades. Up to the present, the efforts to lessen these disputes by action of the national unions involved have

largely failed. It is suggested that the commission recommend to the American Federation of Labor and to the national unions that renewed and more effective efforts be made to prevent such disputes.

12. The essential condition for trade-union graft is the placing of the authority to call strikes or to levy boycotts in the hands of one person without adequate provision for supervision. This condition does not exist in many unions. There is abundant evidence to show that in very many cases it originates with employers who desire to secure an advantage over their competitors. The reason that graft is more prevalent in the building trades is that power is conferred on the business agent to call strikes without reference either to the rank and file or to the national officers. It has been testified by employers who have given much attention to this problem that any well-organized association of employers can eliminate graft whenever its members desire to do so. As far as the unions are concerned the solution seems to lie in the increased participation of the rank and file in the activities of the organization and increased provisions for fixing responsibility upon their business agents.

XIII. ORGANIZATION, METHODS, AND POLICIES OF EMPLOYERS' ASSOCIATIONS.

1. The commission finds that in the past 10 years there has been a rapid growth in employers' associations. These associations, excluding those general associations which have been formed for the purpose of advancing the political, commercial, or legal interests of the employers, may be divided into two classes, bargaining associations and hostile associations. The bargaining associations deal with the unions; the hostile associations oppose collective bargaining.

2. The formation of bargaining associations is essential to the existence of a satisfactory system of joint agreements. A considerable number of employers, although accepting the results of the joint conferences in their trades, do not belong to the associations of employers. It is highly desirable that all employers whose establishments are run in accordance with the terms of a joint agreement should be represented in making that agreement. In many bargaining associations the control over the members is very weak. The association has no power of discipline except expulsion, and where participation in the making of the agreement is regarded as of little importance expulsion is an inadequate remedy.

3. The hostile employers' association is a comparatively recent development. In many cases these associations were formed for the purpose of negotiating joint agreements with the unions, but after the failure of negotiations or the breakdown of an agreement they assumed their present form. In some cases associations which have been hostile have resumed relations with the unions. There is a strong tendency, however, for a hostile association after a few years to develop principles and policies which make any agreement with the unions impossible. The hostile association may be regarded, therefore, as a distinct species with definitely fixed characteristics.

4. In the majority of hostile employers' associations, the basic principle is that the conditions of employment shall be determined solely by the individual employer and the individual workman, but in actual practice this results uniformly in the dictation of conditions

solely by the employer. The "declarations of principles" adopted by these associations declare, for example, that the "number of apprentices, helpers, and handy men to be employed will be determined solely by the employer;" "employees will be paid by the hourly rate, by premium system, by piecework, or contract, as the employers may elect;" "since we, as employers, are responsible for the work turned out by our workmen, we must have full power to designate the men we consider competent to perform the work and to determine the conditions under which that work will be prosecuted." Even as to wages these associations are unwilling to bargain collectively, since they refuse to recognize a minimum wage or any other standard form of wage, without which a collective agreement is impossible.

5. In a few of the more highly centralized employers' associations wage rates are set by the association, although other conditions may be left to the individual employer. In these associations the principle of individual bargaining is modified to the extent that certain minimum conditions of employment are set by the association.

6. The prime function of the hostile associations is to aid their members in opposing the introduction of collective bargaining. The most important device used by the members of the associations in resisting the attempts of the union to replace individual bargaining by joint agreement is discrimination against members of the union. Many of the associations have in their "declarations of principles" the statement that no discrimination will be made against any man because of his membership in any organization, but this rule is not enforced. Ordinarily members of the union are not discriminated against, but if the number of unionists increases in any shop until it becomes large, the employer is advised or decides on his own volition to hire no more members of the union. Moreover, any workman who is prominent in urging the others to form a union is likely to be dismissed. The aim of the association is to prevent in ordinary times such an increase in the number of unionists as will lead to a collective demand. The proposition is effective against collective action, as membership of an individual workman in a union constitutes no menace to the employer's power to control his business unless the individual can persuade others to act with him.

7. Nearly all of the important associations maintain employment agencies. These bureaus enable the members of the association to select nonunionists for employment.

8. Practically all of the associations maintain a secret-service department through which they are able to ascertain the increase in the number of the trade unionists and the feeling of the men. Through this information the association is able to forestall threatened strikes and any other attempt to secure collective action on the part of the workers.

9. In some of the associations an attempt is made to induce the individual employer to change conditions when there is evidence that dissatisfaction exists among his workmen. Similarly some of the associations have been active in promoting safety systems and welfare systems.

10. Inasmuch as the right of workers to organize in any manner that they see fit is fully recognized by society and has repeatedly

been given a legal status in the decisions of even the most conservative courts, there is strong reason for holding that these hostile employers' associations, which are organized primarily for the prevention of organization, are not only antisocial but even perhaps illegal.

It is suggested that the commission strongly recommend:

1. The formation of strong and stable associations of employers for the purpose of negotiating joint agreements and otherwise determining, upon a democratic and equitable basis, the fundamental problems of the trade.

XIV. JOINT AGREEMENTS.

The investigations of the commission, conducted under the direction of Dr. George E. Barnett, as well as the evidence presented at the public hearings, warrant the following conclusions:

1. The conditions of employment can be most satisfactorily fixed by joint agreements between associations of employers and trade unions.

2. Where the association of employers and the union participating in the joint agreement cover the entire competitive district, it becomes possible to regulate the trade or the industry, not merely with reference to wages and hours, but with reference to unemployment, the recruiting of the trade, and the introduction of machinery and new processes. The method of regulation by joint agreement is superior to the method of legislative enactment, since it is more comprehensive, is more elastic, and more nearly achieves the ideal of fundamental democracy that government should to the greatest possible extent consist of agreements and understandings voluntarily made. The method of legislative enactment is inapplicable to many trade problems, and even where it is supplemented by administrative regulation it is cumbersome.

3. The essential element in a system of joint agreements is that all action shall be preceded by discussion and deliberation. If either party through lack of organization is unable to participate effectively in the discussion and deliberation, to that extent the system falls short of the ideal. Where a union or an employers' association delivers its demands in the form of an ultimatum and denies the other party an opportunity collectively to discuss the demands, a fundamental condition of the joint agreement is lacking.

4. The thorough and effective organization of the employers is lacking in many trades in which the workmen are well organized. It is highly desirable that such organization should be brought about.

5. In a few trades agreements have been made which provide that the members of the union will not be allowed to work for any employers who are not members of the employers' association. The usual result is that the employers' association restricts its membership or in some other manner artificially raises prices to the consumer. Such agreements are against the public interest and should not be tolerated.

6. Joint agreements, on the whole, are well kept. There is a constant increase in the sense of moral obligation on the part of both employers and unions. Violations of agreements on the part of a

small number of men or of a single employer occasionally occur. It is found that the unions tend more and more to punish by fines or other disciplinary measure such infraction on the part of their members. The great difficulty in the rapid solution of this problem is that even graver evils than contract breaking are apt to result from giving officials the power which they must have in order to punish properly individuals or local unions for illegal strikes. The employers' associations, from the nature of the case, have less power over their members, but in practically all cases they exercise in good faith what power they have. Furthermore, since the employer in the first instance has the power to interpret the contract, which he may do unjustly, he may actually be guilty of the breach of contract when the employees who strike against such unjust interpretation are apparently the guilty parties.

7. In certain agreements a specified money guaranty is made by each party, and in any breach of the agreement the guaranty is forfeited to the other side. On the whole, such guaranties do not serve a desirable purpose, since there is danger that the parties may come to regard the forfeiture of the guaranty as a compensation for the breach of the agreement.¹ The sense of moral obligation is thus seriously impaired.

8. It does not seem, nor has it been urged by any careful student of the problem, whether employer or worker, that any good end would be served by giving legal validity to joint agreements. The agreements are formulated by parties acting without legal advice, and it not infrequently happens that the form of words adopted is capable of several constructions. In some cases the language is intentionally general, though its purpose may be fully understood by the different parties. It is not desirable that such agreements, the only ones possible under the circumstances, should be construed by the rigid rules customarily used in the courts.

9. Every joint agreement should contain a clause providing for arbitration in the event that the interpretation of the agreement is in dispute. Under such provision the arbitrator would approach the question unhampered by strict rules of construction. The responsibility for breaking an agreement would under such a plan be definitely located.

It is suggested that the commission recommend:

1. The extension of joint agreements as regards not only the field of industry which they cover and the class of labor included but the subjects which are taken up for negotiation and settlement. Greater responsibility for the character, skill, and conduct of their members should accompany the greater participation of trade-unions in the governing of industry.

XV. AGENCIES OF MEDIATION, INVESTIGATION, AND ARBITRATION.

The result of the very extensive investigations which have been made regarding the agencies for mediation and arbitration in this country and abroad have been embodied in the plan for legislation, which is attached hereto. The plan as presented is limited to a national system, but it is recommended that the State legislatures

¹ This statement is not in accordance with the finding of Dr. Barnett, but is formed after consideration of the evidence and opinion of the British Industrial Council.

should enact legislation along the same general lines. The general principles which have governed in drawing up this plan may be stated as follows:

1. The Mediation Commission should be independent of and definitely divorced from every other department of the State or Federal Government. Its only power grows out of its impartiality, and this can not be secured if it is subordinate to any other body whose sympathies either with labor or with capital can be questioned.

2. Mediation should be entrusted to a person as far as possible distinct from those who act as arbitrators or appoint arbitrators.

3. The office of mediator should be placed beyond the suspicion that the office is being used as a reward for party services.

4. The mediator should appoint his own subordinates.

5. It is desirable in the event of the failure of mediation by an official mediator that the parties should be asked to consent to the appointment of a board of mediation and investigation consisting of three persons, one selected by each party and the third by these two. Such a board, it appears, would be able to secure an agreement in many cases where the mediator fails. These boards should have power to summon witnesses and compel the production of papers. In the event that the board could not secure an agreement during the investigation, it should be empowered to make a public report stating the terms on which, in its judgment, the parties should settle.

6. In those cases in which the parties are unable to agree on the third member of the board of mediation and investigation, he should be appointed in the State systems by the State board of arbitration, and in the national system by the mediators, from a list prepared in advance by an advisory board consisting of 10 representatives of employers' associations and 10 representatives of trade unions.

7. National boards of mediation and investigation are to be formed only in disputes involving interstate commerce and in those cases in which the legislature or the executive of a State has requested the intervention of the Federal Government.

8. The Secretary of Labor, or in the States the official bureau or commission, which is created for the protection of the workers, should be employed to appear before the board of mediation and investigation, when it is holding public hearings, either at the request of the board as *amicus curiae* in the ascertainment of facts regarding labor conditions, or, if appealed to, as the spokesman for the employees in the presentation of their case.

PROPOSED PLAN OF A NATIONAL SYSTEM OF MEDIATION, INVESTIGATION, AND ARBITRATION.

ORGANIZATION.

1. *Scope of authority.*—The National Mediation Commission should be given exclusive authority to intervene, under the conditions hereinafter defined, in all industrial disputes involving any corporation, firm, or establishment, except public service establishments, which is engaged in interstate commerce or whose products enter into interstate or foreign commerce.

This provision differentiates its functions from those of the mediation commission existing at present under the Newlands Act. It is considered desirable for the present to provide for the existence of the two commissions, at least until the proposed commission has been thoroughly tested. It is believed to be wise, however, to provide for their close cooperation from the very beginning, with the idea that they will ultimately be consolidated.

It will be noted that this provision also will have the effect of supplanting the mediation powers which are now vested in the Department of Labor. There is no desire to criticise or belittle the past activities of the mediators operating under the Department of Labor, for such criticism is absolutely unwarranted. It is also freely admitted that the Department of Labor has not had either the time or the resources necessary for the proper development of this function. The proposal is made, however, primarily upon three grounds which seem to be sound and, in fact, compelling: First, the function of mediation depends absolutely upon the permanent assurance of impartiality. The Department of Labor was created to represent the interests of labor, and it seems not only inevitable but desirable and proper that the Secretary of Labor should always be drawn from the ranks of organized labor. The function of mediation may be administered with absolute impartiality under any particular Secretary, or even under every Secretary, and yet it seems impossible, even under such conditions, to create that absolute assurance of impartiality which is the prime essential. Second, it is the prerogative and duty of the Department of Labor to act, aggressively if need be, for the protection of the workers at all times, and to utilize every resource at its command to give them that protection. The Department must necessarily be greatly impeded in such frankly partisan action, it would seem, if it must at the same time preserve either the substance or the shadow of impartiality in carrying out its function of mediation. Third, in the bitterest disputes, where the public interest most strongly demands intervention, mediation is seldom successful, and a stage is quickly reached where the most vital necessity is for the full and exact facts regarding the dispute, in order that public opinion may be intelligently formed and directed. Experience has shown that such facts can best be secured fully, quickly, and effectively through the medium of public inquiry. This means that the inquiring body must have power to summon witnesses, compel the production of books and papers, and compel testimony, or the proceeding is worse than a farce. It may be regarded as certain that such powers will never be entrusted to the Department of Labor.

2. *Membership.*—The members of the Mediation Commission should be appointed by the President, with the advice and consent of the Senate. The members should represent in proper balance the interests of employers, employees, and the public. The members should serve for terms of six years.

3. *Advisory board.*—The President of the United States should designate an equal number of leading organizations of employers and leading organizations of employees to appoint representatives to act as an advisory body to the President, to Congress, and to the Mediation Commission. This body, designated hereinafter the advisory board, should give advice regarding the duties of the commission, the administration of its affairs and the selection of mediators,

and be empowered to make recommendations regarding legislation. The advisory board should also prepare lists of persons who may be called upon to serve on boards of arbitration and on boards of mediation and investigation. The advisory board should be called together at least once a year by the chairman of the Mediation Commission; it should have an organization independent of the commission and elect its own chairman and secretary.

The members of the advisory board should be paid traveling and other necessary expenses and such compensation as may be determined upon. Provision should be made for the removal of members by the organizations which they represent.

4. *Subordinate officers and assistants.*—The Mediation Commission should have power to appoint, remove at pleasure, and fix the compensation of a secretary (and a limited number of clerks). The appointment of other officers and assistants, such as mediators, examiners, investigators, technical assessors, experts, disbursing officer, clerks, and other employees, should be subject to the civil-service rules. But arrangements should be made to have the examination include experience and other proper qualifications, and to give the Mediation Commission power to examine all candidates orally.

POWERS, DUTIES AND JURISDICTION.

5. *In interstate commerce.*—(a) *Mediation:* Whenever a controversy concerning conditions of employment arises between employer and employees engaged in interstate commerce other than public service corporations, either party should be able to apply to the chairman of the Mediation Commission for its services in the bringing about of an amicable adjustment of the controversy. Or, the chairman of the commission should be authorized to offer, on his own initiative, the services of the mediators of the commission. If efforts to bring about an amicable adjustment through mediation should be unsuccessful, the commission should at once, if possible, induce the parties to submit their differences to arbitration.

(b) *Arbitration:* Procedure should be similar to that outlined in the Newlands Act. If it is necessary for the Mediation Commission to appoint arbitrators, they should be taken from a list prepared by the advisory board.

(c) *Boards of mediation and investigation:* If the parties to the controversy can not be induced to arbitrate, and if the controversy should threaten to interrupt the business of employers and employees to the detriment of the public interest, the commission should be authorized to request the two parties to consent to the creation of a board of mediation and investigation. If the consent of the parties to the controversy is secured, the commission shall form such a board. Of the three members of the board, one should be selected by the employers, one by the employees and a third on the recommendation of the members so chosen. If either side fails to recommend a member, he should be appointed by the commission. If after a stated time the third member is not recommended, the commission should select him. Appointments to boards of mediation and investigation shall be made by the commission from a list prepared for this purpose by the advisory board. The board of mediation and investigation should offer its friendly offices in bringing about a settlement of

the dispute through mediation. If mediation should not be successful and if the parties to the controversy refuse to arbitrate, this board should have power to make an investigation of the controversy, and should be required to submit to the commission a full report thereon, including recommendations for its settlement. The commission should be empowered to give this report and recommendations adequate publicity.

(d) Powers to secure evidence: A board of mediation and investigation should have power to administer oaths, to subpoena and compel the attendance and testimony of witnesses and the production of books, papers, documents, etc., and to conduct hearings and investigations, and to exercise such other similar powers as might be necessary. It should not have power to prohibit or to impose penalties for strikes or lockouts.

6. *Not in interstate commerce.*—It should be provided that the commission, or a board of mediation and investigation created by it, may exercise the foregoing powers except the compulsory powers under subdivision "d" of proposal 5, for settling industrial controversies between parties not engaged in interstate commerce, if they are requested to do so by the governor or legislature of a State, or by the mayor, council, or commission of a municipality.

7. The Secretary of Labor and the Secretary of Commerce should be authorized to bring to the attention of the commission any dispute in which the intervention of the commission seems desirable. The Secretary of Labor, or such officer as he may designate, should also be authorized to appear before any board of mediation and investigation, either at the request of the board as *amicus curiae* for the ascertainment of facts regarding labor conditions, or, if appealed to, as a spokesman for the employees in the presentation of their case.

COOPERATION.

8. *Cooperation with State and local authorities.*—The commission should be authorized and directed to cooperate with State, local and territorial authorities and similar departments of foreign countries which deal with the adjustment of industrial disputes.

9. *Cooperation with other Federal agencies.*—The commission should, as far as practicable, coordinate its activities and cooperate with other Federal departments in the performance of their duties.

XVI. INDUSTRIAL CONDITIONS AND THE PUBLIC HEALTH—SICKNESS INSURANCE.

The investigations which have been conducted by the commission under the direction of Dr. B. S. Warren, of the Public Health Service, are the basis for the following conclusions:

1. Each of the thirty-odd million wage earners in the United States loses an average of nine days a year through sickness. At an average of \$2 per day, the wage loss from this source is over \$500,000,000. At the average cost of medical expenses (\$6 per capita per year) there is added to this at the very least \$180,000,000.

2. Much attention is now given to accident prevention, yet accidents cause only one-seventh as much destitution as does sickness and one-fifteenth as much as does unemployment. A great deal of unemployment is directly due to sickness, and sickness, in turn, fol-

lows unemployment. The commission's recent study in Indiana showed that 17.9 per cent of unemployment among women in stores in that State was due to illness. In 1901, a Federal investigation of 25,440 workmen's families showed that 11.2 per cent of heads of families were idle during the year on account of sickness, and that the average period of such unemployment was 7.71 weeks. Other investigations show that 30 to 40 per cent of cases requiring charitable relief are immediately due to sickness.

3. Sickness among wage earners is primarily the direct result of poverty, which manifests itself in insufficient diet, bad housing, inadequate clothing, and generally unfavorable surroundings in the home. The surroundings at the place of work and the personal habits of the worker are important but secondary factors.

4. There are three general groups of disease-causing conditions: (1) Those for which the employer and character of the industry and occupation are responsible; (2) those for which the public, through regulatory and relief agencies, is responsible; and (3) those for which the individual worker and his family are responsible.

5. The employers' responsibility includes, besides conditions causing so-called occupational diseases, low wages, excessive hours, methods causing nervous strain, and general insanitary conditions. Many employers already partly recognize their responsibility; aside from "welfare work," many contribute liberally to employees' sick benefit funds or provide for the entire amount.

6. The public has in part recognized its responsibility in such matters as housing, water supply, foods, drugs, and sanitation. But the recognition of responsibility has not been thoroughgoing, and in the case of local health officers the tendency has been too frequently to provide for the better residential sections and neglect the slums.

7. The greatest share of responsibility rests upon the individual, and under present conditions he is unable to meet it. This inability exists by reason of the fact that the majority of wage earners do not receive sufficient wages to provide for proper living conditions, and because the present methods of disease prevention and cure are expensive and sickness is most prevalent among those who are least able to purchase health. The worker is expected to provide for almost certain contingencies in the future when he lacks means of existing adequately in the present.

8. If we might reasonably expect a rapid increase in the wages of all classes of workers to a standard which would permit proper living conditions and adequate medical attention, it would perhaps be inadvisable to recommend any governmental action. But we feel assured that no such condition is to be expected in the near future and believe that new methods of dealing with the existing evils must be adopted.

9. The remedial measures for existing conditions must be based on the cooperative action of those responsible for conditions; must be democratic in maintenance, control, and administration; must distribute costs practicably and justly; and must provide a powerful incentive for sickness prevention.

10. A system of sickness insurance is the most feasible single measure. This conclusion is based on the following:

(a) The losses occasioned by the wage earner's sickness affect employee, employer, and community, all of whom share in the re-

sponsibility. Insurance is the recognized method of distributing loss so as to reduce individual risk to a minimum.

(b) The strongest of incentives—that of lessening cost—is given to efforts to diminish frequency and seriousness of losses; sickness insurance in this respect is a preventive measure of a positive and direct kind. The lower the morbidity and mortality rates, the less the amount necessary for benefits and the lower the insurance rate.

(c) Sickness insurance is no longer experimental, but is rapidly becoming universal. It is not a novelty even in the United States. Although not provided for nor subsidized by Government here, it is most widely used, there being several million workers so insured.

(d) The cost would be no greater than at present. The conclusion appears sound that medical benefits and minimum cash benefits of \$7 per week for a period not exceeding 26 weeks in one year, and death benefits of \$200, can be provided at a total cost of 50 cents per week per insured person. Budgetary studies of large numbers of workingmen's families show that under present conditions from 25 and 50 cents a week up to 70 cents and even \$1.86 is spent for little more than burial insurance. Workers would thus receive immeasurably greater benefits for much less than they now pay.

11. A governmental system of sickness insurance is preferable because—

(a) More democratic; the benefits would be regarded as rights, not charity.

(b) Compulsory features, obnoxious under private insurance, would be no longer objectionable.

(c) On account of the reduction in overhead charges and duplication, higher efficiency in administration would be secured at less cost.

(d) Cooperation with other public agencies is impracticable otherwise.

(e) European experience has proved the superiority of Government systems to private insurance.

(f) Taxation of industry by Federal Government in sickness-insurance system is thoroughly established by the Marine-Hospital Service. Law taxing vessels for such fund was passed in 1798, and its constitutionality has never been questioned.

12. The conclusion seems warranted that a sickness-insurance system for the United States or the several States similar in general principles and methods to the best European systems will be less difficult and radical than has been foreboded. It will not so much introduce new ideas and practices as it will organize existing plans and principles into more effective accomplishment. Existing agencies, in trade-unions, mutual benefit societies, and establishment funds, can be utilized just as they have been in Europe. The real problem becomes one of constructive organization.

It is suggested that the commission recommend a Federal system of sickness insurance, constructed along the lines here briefly summarized.

1. *Membership.*—The membership shall comprise all employees of persons, firms, companies, and corporations engaged in interstate commerce, or whose products are transported in interstate commerce, or which may do business in two or more States. The employees of intrastate establishments to be permitted to be insured, if they so elect, under regulations to be prescribed by the commission.

2. *Fund.*—The fund is to be created by joint contributions by employees, employers, and the Government, the last named sufficient for expenses of administration. Such contributions should probably be in the proportion of 50 per cent from workers, 40 per cent from employers, and 10 per cent from the Government. Individuals or groups desiring larger benefits may arrange to make larger payments, and the rate in any trade, industry, or locality may be reduced where conditions so improve as to make a lower rate adequate. The contributions are to be secured through taxing each interstate employer a certain amount weekly for each employee, the part contributed by workers to be deducted from their wages, thus using the regular revenue machinery of the Government.

3. *Benefits.*—Benefits to be available for a limited period in the form of cash and medical benefits during sickness, nonindustrial accidents, and child bearing; death benefits to be of limited size and payable on presentation of proper evidence.

4. *Administration.*—The administration of the insurance funds is to be carried out by a national sickness insurance commission. The national commission should be composed, by presidential appointment with Senate confirmation, of a director (who would be chairman), representatives of employers and representatives of employees in equal ratio, and, as ex officio nonvoting members, the Federal Commissioner of Labor Statistics and the Surgeon General of the Public Health Service. The commission should be empowered to supervise all funds and determine their character and limits of jurisdiction; promulgate all regulations necessary to enforce the act; establish and maintain hospitals; maintain staffs of medical examiners, specialists, dentists, and visiting nurses; provide for medicines and appliances; make contracts with local physicians; cooperate with local funds and health authorities in disease prevention; and provide for collecting actuarial data.

Correlation of the insurance system with the medical profession, the lack of which has been a serious defect in German and British systems, is absolutely necessary. Contracts with physicians should allow to each a per capita payment for the insured persons under his care, the right of selection of physician to be retained by the insured. For the signing of certificates entitling the insured to benefits, and for treating the insured in hospitals, the Surgeon General should detail physicians from the Public Health Service, their entire time to be given to these and other duties (consulting with local physicians, enforcing Federal laws and regulations, and cooperating with local authorities).

XVII. EDUCATION IN RELATION TO INDUSTRY.

The report dealing with this question has been presented by Commissioner Lennon, and is printed on pages 253-261.

XVIII. SCIENTIFIC MANAGEMENT.

The investigation of scientific management was conducted by Prof. Robert F. Hoxie, with the expert assistance and advice of Mr. Robert G. Valentine, representing the employer's interest in management, and Mr. John P. Frey, representing the interests of labor. The investigation grew out of public hearings held by the commission

during the spring of 1914, at which the almost unqualified opposition of labor to scientific management was manifested. The purpose of the investigation was to test by the results of actual practice the claims of scientific management and the charges of the representatives of organized labor.

The investigation, which covered a period of more than a year, was made with the greatest care and thoroughness. Thirty-five shops and systematizing concerns were examined and interviews were had with a large number of scientific management leaders, experts, and employers. The shops visited were, almost without exception, those designated by authorities on scientific management, such as Messrs. Taylor, Gantt, and Emerson, as the best representatives of the actual results of scientific management. In other words, the examination was practically confined to the very best examples of scientific management. The defects and shortcomings pointed out hereinafter are, therefore, characteristic of the system under the most favorable conditions.

As a result of their investigations, Prof. Hoxie, Mr. Valentine, and Mr. Frey submitted a report, agreed upon without exceptions, in which the statements and recommendations which follow are embodied. These statements constitute a very brief summary of the entire report, which should be read as a whole if a complete understanding of their results and findings is desired.

Throughout the report the term "scientific management" is understood to mean the system devised and applied by Frederick W. Taylor, H. L. Gantt, Harrington Emerson and their followers, with the object of promoting efficiency in shop management and operation.

The report, unanimously agreed upon by the commission's investigator and his advisory experts, is the basis for the following statements.

POSSIBLE BENEFITS OF SCIENTIFIC MANAGEMENT TO LABOR AND SOCIETY.

1. As a system, scientific management presents certain possible benefits to labor and to society:

(a) A close casual relation exists between productive efficiency and possible wages. Greater efficiency and output make possible higher wages in general and better conditions of employment and labor.

In so far, then, as scientific management affords opportunities for lower costs and increased production without adding to the burden of the workers in exhaustive effort, long hours, or inferior working conditions, it creates the possibility of very real and substantial benefits to labor and to society.

(b) It is the policy of scientific management, as a preliminary to strictly labor changes, to bring about improvement and standardization of the material equipment and productive organization of the plant, particularly:

Machinery: Installation, repair, operation.

Tools: Storage, care, delivery.

Material equipment: Rearrangement to avoid delays, etc.

Product: Devices for economical and expeditious handling and routing.

Processes and methods: Elimination of waste motions, improvement of accessories, etc.

Reorganization of managerial staff and improvement of managerial efficiency.

Reorganization of sales and purchasing departments with a view to broadening and stabilizing the market.

Improvements in methods of storekeeping and regulation of delivery, surplus stock, etc.

All such improvements are to be commended, and investigation shows that they are not only accepted by labor without opposition but are, in fact, welcomed.

2. Scientific management in its direct relation to labor is not devoid of beneficial aspects, inasmuch as it is to a large extent an attempt at immediate standardization of labor conditions and relations. It may also serve labor by calling the attention of the employer to the fact that there are other and more effective ways to meet severe competition than by "taking it out of labor."

It is true that scientific management and organized labor are not altogether in harmony in their attitude toward standardization of labor conditions and relations. While both seek to have the conditions of work and pay clearly defined and definitely maintained at any given moment, they differ fundamentally as to the circumstances which may justly cause the substitution of new standards for old ones. Trade-unionism tends to hold to the idea that standards must not be changed in any way to the detriment of the workers. Scientific management, on the other hand, regards changes as justified and desirable if they result in increase of efficiency, and has provided methods, such as time study, for the constant suggestion of such changes.

3. The same may be said of many other major claims of scientific management. Whether the ideals advocated are attained or at present attainable, and whether scientific managers are to be found who purposely violate them, scientific management has in these claims and in the methods upon which they are based shown the way along which we may proceed to more advantageous economic results for labor and for society. It may not have succeeded in establishing a practical system of vocational selection and adaptation, but it has emphasized the desirability of it; it may not set the task with due and scientific allowance for fatigue so that the worker is guarded against overspeeding and overexertion, but it has undoubtedly developed methods which make it possible to better prevailing conditions in this respect; it has called attention most forcibly to the evils of favoritism and the rough and arbitrary decisions of foremen and others in authority. If scientific management be shown to have positive objectionable features, from both the standpoint of labor and the welfare of society, this constitutes no denial of these beneficial features, but calls rather for intelligent social action to eliminate that which is detrimental and to supplement and control that which is beneficial to all.

SCIENTIFIC MANAGEMENT IN PRACTICE—ITS DIVERSITIES AND DEFECTS.

4. Conditions in actual shops do not conform to the ideals of the system, and show no general uniformity. Actual field investigations demonstrated beyond reasonable doubt that scientific management in practice is characterized by striking incompleteness and manifold

diversity as compared with the theoretical exposition of its advocates. This incompleteness and diversity in practice apply not only to matters of detail but cover many of the essential features of scientific management even among those shops designated by Taylor, Gantt, and Emerson as representative of their work and influence. The following particular defects were observed:

(a) *Failure to carry into effect with any degree of thoroughness the general elements involved in the system.*—This may take the form of ignoring either the mechanical equipment and managerial organization, adopting simply a few routine features, such as time study and bonus payment, or the adoption of all mechanical features with a complete disregard of the spirit in which they are supposed to be applied.

(b) *Failure to adopt the full system of "functional foremanship."*—The results of prevailing practices do not support the claim that scientific management treats each workman as an independent personality and that it substitutes joint obedience to fact and law for obedience to personal authority.

(c) *Lack of uniformity in the method of selecting and hiring help.*—Upon the whole the range of excellence in methods of selection and hiring in "scientific" shops was the same as in other shops. The workers in scientific-management shops seem to be a select class when compared with the same classes of workers outside, but this result seems to be due to the weeding out of the less satisfactory material rather than to initial methods of selection.

(d) *Failure to substantiate claims of scientific management with reference to the adaptation, instruction, and training of workers.*—Scientific-management shops in general depend upon nothing in the way of occupational adaptation of the workers except the ordinary trial and error method. Investigation reveals little to substantiate the sweeping claims of scientific managers made in this connection, except that in the better scientific-management shops many workmen are receiving more careful instruction and a higher degree of training than is at present possible for them elsewhere. The most that can be said is that scientific management, as such, furthers a tendency to narrow the scope of the workers' industrial activity, and that it falls far short of a compensatory equivalent in its ideals and actual methods of instruction and training.

e) *Lack of scientific accuracy, uniformity, and justice in time study and task setting.*—Far from being the invariable and purely objective matters that they are pictured, the methods and results of time study and task setting are in practice the special sport of individual judgment and opinion, subject to all the possibilities of diversity, inaccuracy, and injustice that arise from human ignorance and prejudice.

The objects of time study are: (1) Improvement and standardization of the methods of doing the work, without reference to a standard time for its accomplishment, and (2) fixing of a definite task time of efficiency scale.

Possibilities of great advantage exist in the use of time study for the first purpose. However, in a large number of shops, time study for this purpose is practically neglected.

In connection with the second purpose, setting of task time or efficiency scale, great variations are noted, and especially the part

which fallible individual judgment and individual prejudice may and do play.

Detailed observations of the practice of making time studies and setting tasks showed great variations in methods and results. Seventeen separate sources of variation are pointed out, any one of which is sufficient to and in practice does greatly influence the results of time studies.

In face of such evidence it is obviously absurd to talk of time study as an accurate scientific method in practice or of the tasks set by means of it as objective scientific facts which are not possible or proper subjects of dispute and bargaining.

Furthermore, the time-study men upon whom the entire results depend were found to be prevalingly of the narrow-minded mechanical type, poorly paid, and occupying the lowest positions in the managerial organization, if they could be said to belong at all to the managerial group. Nor does the situation seem to promise much improvement, for the position and pay accorded to time-study men generally are such as to preclude the drawing into this work of really competent men in the broader sense. Aside from a few notable exceptions in the shops and some men who make a general profession of time study in connection with the installation of scientific management, this theoretically important functionary, as a rule, receives little more than good mechanic's wages and has little voice in determining shop policies. In fact, the time-study man, who, if scientific management is to make good the most important of its labor claims, should be among the most highly trained and influential officials in the shop, a scientist in viewpoint, a wise arbitrator between employer and workman, is in general a petty functionary, a specialist workman, a sort of clerk who has no voice in the counsels of the higher officials.

However, the method of time study is not necessarily impracticable or unjust to the workers. Under proper direction time study promises much more equitable results than can be secured by the ordinary methods. The greatest essential is a time-study man of exceptional knowledge, judgment, and tact. The average time-study man does not fulfill these requirements at present.

Finally, it is only in connection with standard products, requiring only moderate skill and judgment in layout and work, that economy seems to allow adequate application of the time-study method. Its natural sphere seems to be routine and repetitive work. As long as industry continues to be as complex and diversified as it is, this element of economy will without doubt continue to operate in a way to limit the legitimate scope of time study and task setting. Task setting as at present conducted is not satisfactory to workmen and creates dissatisfaction and jealousy.

(f) *Failure to substantiate the claim of having established a scientific and equitable method of determining wage rates.*—In analyzing the wage-fixing problem in connection with scientific management two matters are considered: (1) The "base rate," sometimes called the day wage, which constitutes for any group of workers the minimum earnings or indicates the general wage level for that group, and (2) added "efficiency payments," which are supposed to represent special additional rewards for special attainments.

The investigators sought in vain for any scientific methods devised or employed by scientific management for the determination of the base rate, either as a matter of justice between the conflicting claims of capital and labor, or between the relative claims of individuals and occupational groups.

Rates for women with reference to men are, as a rule, on the same basis in scientific-management shops as in other shops. One leader said, "There is to be no nonsense about scientific management. If by better organization and administration what is now regarded as man's work can be done by women, women will be employed and women's wages will be paid."

Scientific-management shops seem as ready as others to raise the rates as the wage level generally advances.

"Bewildering diversity" prevails in relation to the "efficiency payment" or reward for special effort. After a careful and extended analysis and investigation of the different ways of rewarding individual increases in output, it was concluded:

All of these systems definitely belie the claim that scientific management pays workers in proportion to their efficiency. One of them has the obvious intent of weeding out the lower grade of workers, while the other two are so constituted as to make such workers very unprofitable to the employers. Two of them lend themselves easily to the exploitation of mediocre workers—those who can deliver a medium output but can not attain to a standard task set high. All of them furnish a strong stimulus to high efficiency and output, but in themselves furnish no visible check on overspeeding and exhaustion. All of them are capable of being liberally applied, but all can also be used as instruments of oppression through the undue severity of task setting or efficiency rating.

There can be no doubt that under scientific management rates are cut. But to say positively that scientific management, on the whole, furthers the cutting of rates is quite another matter. The fact seems clear that at this point there is a conflict of tendencies within the thing itself. There is a strong inducement for scientific managers to maintain rates strictly, and the honest efforts of those who deserve the name to so maintain them can hardly be impugned. At the same time, however, the greatest advance toward efficiency, for which scientific management stands, is obtained by the constant alteration of conditions and tasks through time study. Such alterations almost of necessity mean constant rate cutting. Were industry once standardized for good and all, scientific management would undoubtedly operate as an unequivocal force tending to the maintenance of rates. As it is with industry in flux, what amounts to rate cutting seems to be almost of necessity an essential part of its very nature.

Finally, all of the systems of payment tend to center the attention of the worker on his individual interest and gain and to repress the development of group consciousness and interest. Where the work of one man is independent of another, the individual has no motive to consider his fellow, since his work and pay in no wise depend on the other man. What either does will not affect the other's task or rates. Where work is independent, the leader can not afford to slow down to accommodate his successor.

It must be admitted that these systems are admirably suited to stimulate the workers, but in so far as there may be virtue in the

union principles of group solidarity and uniformity, and in so far as they lay claim to scientific accuracy or a special conformity to justice in reward, they must be judged adversely.

(g) *Failure to protect the workers from overexertion and exhaustion.*—It is claimed by scientific management that protection to workers is afforded by such devices as: Standardization of equipment and performance; substitution of exact knowledge of men and of machines for guesswork in the setting of the task and the determination of the hours and other conditions of work; careful studies of fatigue; elimination of the need for pace setters; transformation of speeders into instructors, and transfer of responsibility from the workers to the management for contriving the best methods of work; maintenance of the best conditions for performing work through furnishing the best tools and materials at the proper time and place; instruction of the workers in the most economical and easiest methods of performing operations; institution of rational rest periods and modes of recreation during working hours; and surrounding the workers with the safest and most sanitary shop conditions.

Investigation indicates that scientific management, in practice, furnishes no reasonable basis for the majority of these specific claims in the present, and little hope for their realization in the near future. In these matters, indeed, the utmost variation prevails in scientific management as in other shops. Several admirable cases were found with respect to all these matters, but shops were not wanting where the management exhibited the utmost suspicion of the workers, referring continually to their disposition to "beat the time-study man," although the time study in such shops was obviously based on the work of speeders and all sorts of inducements were offered for pace setting, where instruction and training of the workers were emphasized by their absence, and where the general conditions of the work were much in need of improvement.

The investigation seems to show clearly that practical scientific management has not materially affected the length of the working day. Aside from shops where the management was evidently imbued with a strong moral sense, the hours of labor in these shops were those common to the industry and the locality.

When we come to the matter of fatigue studies and their connection with speeding and exhaustion, the claims of scientific management seem to break down completely. No actual fatigue studies were found taking place in the shops, and the time-study men, who should be charged with such studies, seemed in general to be quite indifferent or quite ignorant in regard to this whole matter. This does not mean that no attention to fatigue is given in scientific management shops. Cases were found where the health and energy of the workers were carefully observed and attempts were made to adopt the work to their condition, but the methods employed were the rough-and-ready ones of common-sense observation. Rest periods and modes of recreation during the working hours are a regular institution on an extended scale in but one shop visited by the investigators. Isolated instances were encountered elsewhere, but managers in general apparently do not even entertain the idea of their institution.

Scientific management does not always surround the workers with the safest and most sanitary shop conditions. In general, scientific

management shops seem to be good shops as shops go. The introduction of the system has the tendency without doubt to clean the shop up and to improve the condition of belting, machinery, and arrangement of material equipment generally. All this is in the direct line of efficiency and safety. Several very notable examples of excellence in safety and sanitation were found. On the other hand, several shops visited were below good standards in these respects, and flagrant specific violations of safety rules were encountered.

As a whole, the facts in nowise justify the assumption that scientific management offers any effective guaranty against overspeeding and exhaustion of workers. The investigation left a strong impression that scientific management workers in general are not overspeeded, but the challenge to show any overspeeded or overworked men in scientific management shops in very easily met. The situation in this respect varies much with the industry. Some instances of undoubted overspeeding were found, particularly in the case of girls and women. But these instances do not warrant a general charge. On the other hand, there appears to be nothing in the special methods of scientific management to prevent speeding up where the technical conditions make it possible and profitable, and there is much in these methods to induce it in the hands of unscrupulous employers.

(h) *Failure to substantiate the claim that scientific management offers exceptional opportunities for advancement and promotion on a basis of individual merit.*—While scientific management undoubtedly separates the efficient from the inefficient more surely and speedily than ordinary methods, it was shown by the investigation that scientific management often fails in the development of functional foremanship and in the elimination of favoritism. It tends to create a multitude of new tasks on which less skill is required and lower rates can be paid. It has developed no efficient system for the placing or adaptation of the workers. It is inclined in practice to regard a worker as adapted to his work and rightly placed when he succeeds in making the task. It tends to confine the mass of workmen to one or two tasks, and offers little opportunity, therefore, for the discovery and development of special aptitudes among the masses. It tends to divide the workers into two unequal classes—the few who rise to managerial positions and the many who seem bound to remain task workers within a narrow field. In the ideal it offers opportunity for promotion from the ranks, and this works out to a certain extent in practice, but not universally.

There is a great deal of exaggeration, too, in statements made concerning special rewards for usable suggestions. Few of the shops make any systematic rewards of this kind, and where this is the case the rewards are usually trivial. In one shop the investigator was shown an automatic machine invented by a workman, which did the work of several hand workers. "Did he receive a reward?" was asked. "Oh, yes," came the answer, "his rate of pay was increased from 17 to 22 cents per hour."

(i) *With reference to the alleged methods and severity of discipline under scientific management the "acrimonious criticism" from trade unions does not seem to be warranted.*—In theory, the scientific managers appear to have the best of the argument, and in

practice the investigation showed an agreeable absence of rough and arbitrary disciplinary authority. When the tasks were liberally set, the workers were found generally operating without special supervision except where instructions or assistance were needed. Deductions were indeed made for poor work and destruction of materials, but in the better class of shops apparently with no greater and perhaps with less than ordinary severity.

While it should be remembered that the shops selected represented probably the best of the shops operating under this system, in general, it would seem that scientific management does lessen the rigors of discipline as compared with other shops where the management is autocratic and the workers have no organization.

(j) *Failure to substantiate the claim that workers are discharged only on just grounds and have an effective appeal to the highest managerial authority.*—This whole matter is one in which neither management claims nor union complaints seem susceptible of proof, but the investigation indicates that the unions have legitimate basis for charging that discharge is generally a matter of arbitrary managerial authority.

(k) *Lack of democracy under scientific management.*—As a result of the investigation, there can be little doubt that scientific management tends in practice to weaken the power of the individual worker as against the employer, setting aside all questions of personal attitude and the particular opportunities and methods for voicing complaints and enforcing demands. It gathers up and transfers to the management the traditional craft knowledge and transmits this again to the workers only piecemeal as it is needed in the performance of the particular job or task. It tends in practice to confine each worker to a particular task or small cycle of tasks. It thus narrows his outlook and skill to the experience and training which are necessary to do the work. He is therefore easier of displacement. Moreover, the changing of methods and conditions of work and the setting of tasks by time study with its assumption always of scientific accuracy puts the individual worker at a disadvantage in any attempt to question the justice of the demands made upon him. The onus of proof is upon him and the standards of judgment are set up by the employer, covered by the mantle of scientific accuracy.

It would seem also that scientific management tends, on the whole, to prevent the formation of groups of workers within the shop with recognized common interests, and to weaken the solidarity of those which exist. Almost everything points to the strengthening of the individualistic motive and the weakening of group solidarity. Each worker is bent on the attainment of his individual task. He can not combine with his fellows to determine how much that task shall be. If the individual slows down he merely lessens his wages and prejudices his standing without helping his neighbor. If he can beat the other fellow, he helps himself without directly affecting the other's task or pay. Assistance, unless the man is a paid instructor, is at personal cost. Special rewards, where offered, are for the individual. Rules of seniority are not recognized. Sometimes personal rivalry is stimulated by the posting of individual records or classification of the workers by name into "excellent," "good," "poor," etc. Potential groups are broken up by the constant changes in methods and reclassification of workers which are the mission of time study.

The whole gospel of scientific management to the worker is to the individual, telling him how, by special efficiency, he can cut loose from the mass, and rise in wages or position.

With the power of the individual weakened and the chances lessened for the development of groups and group solidarity, the democratic possibility of scientific management, barring the presence of unionism, would seem to be scant. The individual is manifestly in no position to cope with the employer on a basis of equality. The claim to democracy based on the close association of the management and the men and the opportunities allowed for the voicing of complaints is not borne out by the facts; and in the general run of scientific-management shops, barring the presence of unionism and collective bargaining, the unionists are justified in the charge that the workers have no real voice in hiring and discharging, the setting of the task, the determination of the wage rates, or the general conditions of employment. This charge is true even where the employers have no special autocratic tendencies, much more so therefore where, as in many cases, they are thoroughly imbued with the autocratic spirit. With rare exceptions, then, democracy under scientific management can not and does not exist apart from unionism and collective bargaining.

Does the scientific manager, as a matter of fact, welcome the cooperation of unionism? Here, again, the facts should decide the contention. The fact is that while in numbers of scientific-management shops some unionists are employed, they are not generally employed as union men, and the union is rarely recognized and dealt with as such. The fact is that those who declare the willingness of scientific management to welcome the cooperation of unionism in general either know nothing about unionism and its rules and regulations or are thinking of a different kind of unionism from that to which the American Federation of Labor stands committed and a kind of cooperation foreign to its ideals and practices.

To sum up, scientific management in practice generally tends to weaken the competitive power of the individual worker and thwarts the formation of shop groups and weakens group solidarity; moreover, generally scientific management is lacking in the arrangements and machinery necessary for the actual voicing of the workers' ideas and complaints and for the democratic consideration and adjustment of grievances. Collective bargaining has ordinarily no place in the determination of matters vital to the workers, and the attitude toward it is usually tolerant only when it is not understood. Finally unionism, where it means a vigorous attempt to enforce the viewpoint and claims of the workers, is in general looked upon with abhorrence, and unions which are looked upon with complacency are not the kind which organized labor in general wants, while the union cooperation which is invited is altogether different from that which they stand ready to give. In practice scientific management must, therefore be declared autocratic in tendency—a reversion to industrial autocracy, which forces the workers to depend on the employers' conception of fairness and limits the democratic safeguards of the workers.

5. Scientific management is still in its infancy or early trial stages, and immaturity and failure to attain ideals in practice are necessary accompaniments to the development of any new industrial or social

movement. Doubtless many of its diversities and shortcomings will, therefore, be cured by time.

Before this can be brought about, however, certain potent causes of present evil must be eradicated:

(a) The first of these is a persistent attempt on the part of experts and managers to apply scientific management and its methods outside their natural sphere.

(b) A second chief source of danger and evil to labor in the application of scientific management is that it offers its wares in the open market, but it has developed no means by which it can control the use of these by the purchaser. In large part the practical departure of scientific management from its ideals is the result of special managerial or proprietorial aims and impatience of delay in their fulfillment. The expert is frequently called in because the establishment is in financial or industrial straits, and the chief concern of the management is quick increase of production and profits. It must meet its competitors here and now, and can not afford to expend more than is necessary to do this, or to forego immediate returns while the foundations are being laid for a larger but later success, and with careful regard to immediate justice and the long-time welfare of its working force. The outcome frequently is conflict between the systematizer and the management, resulting in the abandonment of the scheme only partially worked out on the retirement of the expert, leaving the management to apply crudely the methods partially installed, sometimes to the detriment of the workers and their interests.

It is true that the situation thus outlined is not of universal application. But bitter complaints were frequently heard from members of the small group of experts who represent the highest ideals and intelligence of the movement, in regard to the managerial opposition which they have encountered, and frequent apologies were offered for the conditions and results of their work, accompanied by the statement that they could go no further than the management would allow, or that things had been done by the management against their judgment and for which they could not stand. Moreover, scientific management is closely interlocked with the mechanism of production for profit and the law of economy rules. Many things which would be desirable from the ideal standpoint, and which are a practical necessity if the interests of the workers are to be fully protected, are not always or usually economical. This is specially true of time study, task setting, and rate making.

The arbitrary will of the employer and the law of economy are two potent special forces which contribute to the existing diversity, incompleteness, and crudity of scientific management as it is practiced, even where the systematizer is possessed of the highest intelligence and imbued with the best motives of his group.

(c) But to explain the situation as it exists at present, two other important factors must be taken into consideration. The first of these is the existence and practice of self-styled scientific management systematizers and time study experts who lack in most respects the ideals and the training essential to fit them for the work which they claim to be able to do. Scientific management as a movement is cursed with fakirs. The great rewards which a few leaders in the movement have secured for their services have brought into the field

a crowd of industrial "patent medicine men." The way is open to all. No standards or requirements, private or public, have been developed by the application of which the goats can be separated from the sheep. Employers have thus far proved credulous. Almost anyone can show the average manufacturing concern where it can make some improvements in its methods. So the scientific management shingles have gone up all over the country, the fakirs have gone into the shops, and in the name of scientific management have reaped temporary gains to the detriment of both the employers and the workers.

(d) Fake scientific management experts, however, are not alone responsible for the lack of training and intelligence which contributes to the diversity and immaturity of scientific management in practice and its failure to make good the labor claims of its most distinguished leaders. The fact is that on the whole, and barring some notable exceptions, the sponsors and adherents of scientific management—experts and employers alike—are profoundly ignorant of very much that concerns the broader humanitarian and social problems which it creates and involves, especially as these touch the character and welfare of labor.

It is because of this ignorance and unwarranted assurance that there is a strong tendency on the part of scientific management experts to look upon the labor end of their work as the least difficult and requiring the least careful consideration. To their minds the delicate and difficult part of the task of installation is the solution of the material, mechanical, and organic problems involved. They tend to look upon the labor end of their work as a simple technical matter of so setting tasks and making rates that the workers will give the fullest productive cooperation. They tend naively to assume that when the productivity of the concern is increased and the laborers are induced to do their full part toward this end, the labor problem in connection with scientific management is satisfactorily solved. In short, in the majority of cases the labor problem appears to be looked at as one aspect of the general problem of production in the shop, and it is truthfully assumed that if it is solved with reference to this problem it must also be solved with due regard to labor's well-being and its just demands. This seems to have been the characteristic attitude of scientific management from the beginning. Labor was simply looked upon as one of the factors entering into production, like machinery, tools, stores, and other elements of equipment. The problem was simply how to secure an efficient coordination and functioning of these elements. It was only after the opposition of labor had been expressed that scientific management began to be conscious of any other aspect of the labor matter. And with some notable exceptions scientific management experts and employers still look upon the labor matter almost solely as an aspect of the general production problem, and have little positive interest or concern in regard to it otherwise.

It is probable that scientific managers will object to these statements, pleading that they are mainly variations and conditions due to the time element or to the necessity imposed by the law of costs. They will say, for example, that when a new and unusual job comes in, neither time nor economy will allow of careful time studies, and if careful studies were made of all the variations of a complicated

task, the expense of such studies would wipe out the profit; that, in general, they are proceeding toward the full realization of the ideal of scientific management as fast as economy will allow. But such pleas would serve only to confirm the main contention that scientific managers and scientific management employers generally are necessarily ruled, like all members of the employing group, by the forces of cost and profits; that to them the labor problem is primarily an aspect of the problem of production, and that in the ends the needs and welfare of labor must be subordinated to these things. Beneath all other causes or shortcomings of scientific management, therefore, in its relation to labor, there seems to be the practical fact of an opposition of interests between the profit-taking and the labor group, which makes extremely doubtful the possibility that its shortcomings from the standpoint of labor are capable of elimination.

GENERAL LABOR PROBLEMS.

6. (a) Scientific management at its best furthers the modern tendency toward the specialization of the workers. Its most essential features—functional foremanship, time study, task setting, and efficiency payment—all have this inherent effect.

Under the scientific management system fully developed, the ordinary mechanic is intended to be and is, in fact, a machine feeder and a machine feeder only, with the possibility of auxiliary operations clearly cut off and with means applied to discourage experimentation. And what applies to the machine feeder applies with more or less thoroughness to machine and hand operatives generally.

But it is not merely in stripping from the job its auxiliary operations that scientific management tends to specialize the work and the workmen. Time study, the chief cornerstone of all systems of scientific management, tends inherently to the narrowing of the job or task itself. As the final object of time study, so far as it directly touches the workers, is to make possible the setting of tasks so simple and uniform and so free from possible causes of interruption and variation that definite and invariable time limits can be placed upon them, and that the worker may be unimpeded in his efficient performance of them by the necessity for questioning and deliberation, the preponderating tendency of time study is to split up the work into smaller and simpler operations and tasks. Decidedly, then, time study tends to further the modern tendency toward specialization of the job and the task.

With functional foremanship lopping off from the job auxiliary operations, and time study tending to a narrowing of the task itself, task setting and efficiency methods of payment come into play as forces tending to confine the worker to a single task or a narrow range of operations. The worker is put upon the special task for which he seems best adapted, and he is stimulated by the methods of payment employed to make himself as proficient as possible at it. When he succeeds in this, to shift him to another task ordinarily involves an immediate and distinct loss to the employer, and the worker himself naturally resents being shifted to a new task since this involves an immediate loss in his earnings. Here worker and employer are as one in their immediate interest to have the job so

simple that the operation can be quickly learned, and the task made, and that shifting of tasks be eliminated as far as possible. The employer besides has another motive for this, in that the shifting of the workers multiplies the records and renders more complex the system of wage accounting. It is true that the scientific management employer, like any other, must have a certain number of workers in the shop who are capable of performing a plurality of tasks. But the tendency is to have as few all-round workers as are necessary to meet these emergencies. The methods of scientific management operate most effectively when they break up and narrow the work of the individual, and the ends of scientific management are best served when the rank and file of the workers are specialists.

This inherent tendency of scientific management to specialization is buttressed, broadened in its scope and perpetuated by the progressive gathering up and systematizing in the hands of the employers of all the traditional craft knowledge in the possession of the workers. With this information in hand and functional foremanship to direct its use, scientific management claims to have no need of craftsmen, in the old sense of the term, and, therefore, no need for an apprenticeship system except for the training of functional foremen. It therefore tends to neglect apprenticeship except for the training of the few. And as this body of systematized knowledge in the hands of the employer grows, it is enabled to broaden the scope of its operation, to attack and specialize new operations, new crafts and new industries, so that the tendency is to reduce more and more to simple, specialized operations, and more and more workers to the positions of narrow specialists. Nor does scientific management afford anything in itself to check or offset this specialization tendency. The instruction and training offered is for specialist workmen. Selection and adaptation are specializing in their tendencies. Promotion is for the relatively few. The whole system, in its conception and operation, is pointed toward a universally specialized industrial régime.

(b) But scientific management is not only inherently specializing; it also tends to break down existing standards and uniformities set up by the workmen, and to prevent the establishment of stable conditions of work and pay. Time study means constant and endless change in the method of operation. No sooner is a new and better method discovered and established and the condition of work and pay adapted to it than an improvement is discovered involving perhaps new machinery, new tools and materials, a new way of doing things, and a consequent alteration of the essential conditions of work and pay, and perhaps a reclassification of the workers.

(c) Ample evidence to support this analysis was afforded by the investigation. Where the system was found relatively completely applied, the mass of the workers were engaged in specialized tasks, there was little variation in the operations except in emergencies, apprenticeship for the many was abandoned or was looked upon as an investment which brought no adequate returns and was slated for abandonment; almost everywhere scientific management employers expressed a strong preference for specialist workmen, old crafts were being broken up and the craftsmen given the choice of retirement or of entering the ranks of specialized workmen; in the most progressive shops, the time study men were preparing the way

for a broader application of the system by the analytical study of the operations and crafts not yet systematized. Changes in methods and classification of workers were seen even during the short course of the investigation.

(d) What does this mean from the standpoint of labor and labor welfare? Certain conclusions are inevitable. Scientific management, fully and properly applied, inevitably tends to the constant breakdown of the established crafts and craftsmanship and the constant elimination of skill in the sense of narrowing craft knowledge and workmanship except for the lower orders of workmen. Some scientific management employers have asserted belief in their ability to get on a paying basis within three months, should they lose their whole working force except the managerial staff and enough others to maintain the organization, if they had to begin all over again with green hands. What this means in increased competition of workmen with workmen can be imagined. Were the scientific management ideal fully realized, any man who walks the street would be a practical competitor for almost any workman's job.

Such a situation would inevitably break down the basis of present-day unionism and render collective bargaining impossible in any effective sense in regard to the matters considered by the unions most essential. It has been proved by experience that unskilled workers generally find it most difficult to maintain effective and continuous organization for dealing with complicated industrial situations. Effective collective bargaining can not exist without effective organization. Moreover, we have already seen how scientific management, apart from the matter of skill, tends to prevent the formation and weakens the solidarity of groups within the shops.

But, beyond all this, time study strikes at the heart and core of the principles and conditions which make effective unionism and collective bargaining possible with respect to certain most essential matters. When the employer can constantly initiate new methods and conditions and reclassify the work and the workmen, he can evade all efforts of the union to establish and maintain definite and continuous standards of work and pay. Time study is in definite opposition to uniformity and stable classification. It enables the employer constantly to lop off portions of the work from a certain class and then to create new classifications of workers, with new conditions of work and pay. Add to all of this the advantage gained by the employers in the progressive gathering up and systematization of craft knowledge for their own uses, and the destruction of apprenticeship, which cuts the workers off from the perpetuation among them of craftsmanship, and the destructive tendencies of scientific management as far as present-day unionism and collective bargaining are concerned, seems inevitable.

(e) Under these circumstances the progressive degeneration of craftsmanship and the progressive degradation of skilled craftsmen also seems inevitable.

(f) The ultimate effects of scientific management, should it become universal, upon wages, employment, and industrial peace, are matters of pure speculation. During the period of transition, however, there can be little doubt of the results. The tendency will be first toward a realignment of wage rates. The craftsmen, the highly trained workers, can not hope to maintain their wage advantage over

the semiskilled and less skilled workers. There will be a leveling tendency. Whether this leveling will be up or down, it is impossible to say. At present scientific management seems to be making the relatively unskilled more efficient than ever before, and they are in general receiving under it greater earnings than ever before. It is evident, however, that the native efficiency of the working class must suffer from the neglect of apprenticeship. Scientific managers have themselves complained bitterly of the poor material from which they must recruit their workers, compared with the efficient and self-respecting craftsman who applied for employment 20 years ago.

Moreover, it must not be overlooked that the whole scheme of scientific management, and especially the gathering up and systematizing of the knowledge formerly the possession of the workmen, tends enormously to add to the strength of capitalism. This fact, together with the greater ease of displacement shown above, must make the security and continuity of employment inherently more uncertain.

If generally increased efficiency is the result of scientific management, unemployment would in the end seem to become less of a menace. But during the period of transition its increase should be expected. Not only must the old craftsmen suffer as the result of the destruction of their crafts, but until scientific management finds itself able to control markets its increased efficiency must result in gluts in special lines, with resulting unemployment in particular trades and occupations. A leading scientific-management expert has stated that one shop of six in a certain industry systematized by him could turn out all the product that the market would carry. The result to the workers, if the statement be true, needs no explanation. Scientific management would seem to offer possibilities ultimately of better market control or better adaptation to market conditions, but the experience of the past year of depression indicates that at present no such possibilities generally exist.

Finally, until unionism as it exists has been done away with or has undergone essential modification, scientific management can not be said to make for the avoidance of strikes and the establishment of industrial peace. The investigation has shown several well-authenticated cases of strikes which have occurred in scientific-management shops. They are perhaps less frequent in this class of shop than elsewhere in similar establishments, owing largely to the fact that organized workmen are on the whole little employed. In its extension, however, it is certain that scientific management is a constant menace to industrial peace. So long as present-day unionism exists and unionists continue to believe, as they seem warranted in doing, that scientific management means the destruction of their organizations or their present rules and regulations, unionism will continue to oppose it energetically and whenever and wherever opportunity affords.

It has been said with much truth that scientific management is like the invention of machinery in its effect upon workers and social conditions and welfare generally—that it gives a new impulse to the industrial revolution which characterized the latter part of the eighteenth and nineteenth centuries and strengthens its general effects and tendencies. A chief characterization of this revolution has been the breakdown of craftsmanship, the destruction of crafts,

and the carrying of the modern industrial world toward an era of specialized workmanship and generally semiskilled or unskilled workmen. Scientific management seems to be another force urging us forward toward this era.

CONCLUSIONS.

7. Our industries should adopt all methods which replace inaccuracy with accurate knowledge and which systematically operate to eliminate economic waste. Scientific management at its best has succeeded in creating an organic whole of the several departments of an institution, establishing a coordination of their functions which has previously been impossible, and, in this respect, it has conferred great benefits on industry.

The social problem created by scientific management, however, does not lie in this field. As regards its social consequences neither organized nor unorganized labor finds in scientific management any adequate protection to its standards of living, any progressive means for industrial education, any opportunity for industrial democracy by which labor may create for itself a progressively efficient share in management. Therefore, as unorganized labor is totally unequipped to work for these human rights, it becomes doubly the duty of organized labor to work unceasingly and unswervingly for them, and, if necessary, to combat an industrial development which not only does not contain conditions favorable to their growth, but, in many respects, is hostile soil.

XIX. PRISON LABOR.

The evidence which has come before the commission is the basis for the following statements:

1. The practice of using convicts in penitentiaries and prisons generally for the manufacture of articles for general commerce has been productive of evil results as regards not only the convicts but the general public.

2. The competition of prison-made articles has resulted in the existence of a low wage scale in many industries and has subjected the manufacturers to a kind of competition which should not exist in any civilized community.

3. The only beneficiaries of the convict labor system are the contractors who are permitted by the State to exploit the inmates of prisons.

4. The individual States are powerless to deal adequately with this situation because of the interstate shipment of convict-made goods.

It is suggested that the commission recommend:

1. The abolition as far as possible of indoor manufacture, and the substitution of such outdoor work as that upon State farms and State roads, providing that where prisoners are employed they should be compensated and that the products which they manufacture should not be sold in competition with the products of free labor.

2. The enactment by Congress of a bill providing that all convict-made goods when transported into any State or Territory of the United States shall be subject to the operation of the laws of such

State or Territory to the same extent and in the same manner as though such goods had been produced therein.

XX. IMMIGRATION.

The evidence presented to the commission is the basis for the following statements:

1. The immigration policy of the United States has created a number of our most difficult and serious industrial problems and has been responsible in a considerable measure for the existing state of industrial unrest.

2. The enormous influx of immigrants during the past 25 years has already undermined the American standard of living for all workmen except those in the skilled trades, and has been the largest single factor in preventing the wage scale from rising as rapidly as food prices.

3. The great mass of non-English-speaking workers, who form about one-half of the labor force in the basic industries, has done much to prevent the development of better relations between employers and employees.

4. The presence of such a large proportion of immigrants has greatly hampered the formation of trade-unions and has tremendously increased the problem of securing effective and responsible organizations.

5. The unreasonable prejudice of almost every class of Americans toward the immigrants, who form such a large proportion of the labor force of our industries, has been largely responsible for the failure of our Nation to reach a correct understanding of the labor problem and has promoted the harshness and brutality which has so often been manifested in connection with industrial disturbances. It has been and to a large measure still is felt possible to dismiss the most revolting working conditions, the most brutal treatment, or the most criminal invasions of personal rights, by saying, "Oh, well, they are just ignorant foreigners."

6. If immigration had continued at the average rate of the past 10 years it would have proved almost, if not quite, impossible to have brought industrial conditions and relations to any proper basis, in spite of the most extreme efforts of civic organizations, trades-unions, and governmental machinery. The great diminution of immigration as a result of the European war has already begun to show its salutary effects.

It is suggested that the commission recommend:

1. The enactment of legislation providing for the restriction of immigration based upon the general provisions contained in the so-called Burnett-Dillingham bill, which has received the approval of two successive Congresses. With a full realization of the many theoretical objections which have been urged against the literacy test, the consensus of evidence is so strong that its practical workings would be to restrict immigration to those who are likely to make the most desirable citizens, to regulate immigration in some degree in proportion to the actual needs of American industry, and finally to promote education in Europe, that it seems necessary at least to urge that this plan be given a practical test.

2. The enactment of legislation providing that within six months from the time of entry all immigrants shall be required, under penalty of deportation, either to declare their intention to become citizens by taking out their first papers or to definitely register themselves with the proper authority as alien tourists, and further providing that all immigrants who have failed to take out their first papers at the end of two years shall be deported, as shall all who fail to take out their second papers when they become eligible, deportation in each case to act as a bar to future entry.

3. The provision by the States and municipalities, with the assistance of the Federal Government, if necessary, for the education of all adult persons who are unable to speak, read, or write the English language. In order to accomplish this it may be necessary to provide that employers shall grant certain definite periods of leisure for such instruction.

XXI. LABOR CONDITIONS IN AMERICAN COLONIAL POSSESSIONS.

The attention of the commission was directed to the labor conditions in American colonies by the strike of some 20,000 agricultural laborers in the island of Porto Rico, and by the appeal of the representatives of the Free Federation of Labor of Porto Rico for a hearing at which they might present their statement of the labor conditions, relations between laborers and employers, and the attitude assumed by the local Government during the strike. The commission granted the hearing and, in order that a full and fair presentation of the conditions should be made, invited the Government of Porto Rico to appoint representatives who were fully acquainted with the situation. As a result of the hearing of the testimony of these witnesses, a situation was found which demands immediate attention in order that widespread and deep-rooted evils should be eliminated. These conditions are in large measure an inheritance from centuries of despotic Spanish rule, and it is undeniable that great improvements in certain lines have been accomplished under American administration. Nevertheless, a peculiar responsibility rests upon the American Nation for the conditions of the people in our colonial possessions who occupy the position morally and legally of wards of the Nation.

The investigations were confined to the conditions in Porto Rico, but through the petitions filed with the commission by the inhabitants of other islands and through the information contained in reports of governmental officials, it seems certain that the labor conditions in all American colonies are generally similar to those in Porto Rico, and demand the attention of Congress.

As a result of the investigations and a careful analysis of the extensive documentary evidence filed, the following statements with regard to industrial and social conditions in Porto Rico are warranted:

1. Laborers in Porto Rico, including men, women, and children, are employed at wages which are inadequate to furnish proper food and clothing. The wages of men in agricultural districts range from 35 to 60 cents a day, when employed, and those of the women and children are about one-half this amount.

2. As a result largely of the low-wage standard, the diet of the laborers, consisting chiefly of rice, beans, codfish, and plantains, is so miserably inadequate that the worker not only is rendered inefficient but is to a large extent undernourished.

3. The laborers are further exploited on the large plantations, according to the testimony of the Government representatives, by exorbitant prices for food and other supplies, by deliberate cheating as regards weights and measures, and by unwarranted deductions from their wages for goods that were never purchased.

4. The educational facilities of Porto Rico are so totally inadequate that there are nearly 200,000 children for whose education no provision has been made.

The representatives of the colonial Government give a lack of ability to finance the educational system as the reason for the present conditions.

5. Many thousand people yearly, located in the rural districts, far from medical attendance and unable to afford the high charges of the physicians, die without medical attendance.

6. The labor laws of Porto Rico are inadequate, and the Bureau of Labor is not provided with sufficient funds to enforce the existing laws. The laws supposed to regulate the labor of women and children are generally violated. The provisions of the law restraining child labor are largely nullified by the insertion of a clause which permits this labor if the child is accompanied by a parent or other relative.

The employers' liability law of the island has the archaic fellow-servant clause in it and therefore is noneffective.

7. The great majority of the Porto Ricans are landless, the land of Porto Rico being largely owned by the corporations, wealthy landlords, and the colonial Government and municipalities. Very little land is for sale.

8. As a result, the land rents are inordinately high and tend very strongly to retard the development of a middle class.

9. The housing conditions of the workers are extremely bad. The majority of the rural workers live in huts which do not cost more than \$10 to build, and these huts are occupied, on an average, by five people each, although at best there are only semipartitions dividing the huts into two rooms. The existing conditions are a menace not only to health but to morality and every sense of decency.

10. The laborers may be ejected from the huts provided by the employers at any time that the owner sees fit, and, while they pay no rent, they must and do work for the owner at his pleasure.

11. In the cities the conditions are almost equally bad. The city laborers rent apartments or build little houses on rented land. As an illustration of this condition: There were, in 1912, 10,936 people in Puerto de Tierra. These people lived in 1,144 houses, and practically 98 per cent of them were renters, as the occupants of only 30 houses owned both house and land. The land of one owner, which was assessed at \$6,340, brought in a total rent of \$2,580, or 37.4 per cent. That of another, assessed at \$29,460, yielded \$7,821 in rent, or 23.9 per cent.

12. Unemployment is very prevalent in the island, and it has been testified that, largely as the result of stimulated immigration, there are between 200,000 and 300,000 more workers than jobs.

13. The immigrants from the English-speaking islands or from the mainland are given preference over the native Porto Ricans, who speak Spanish. This has resulted in much hardship to the natives.

14. The strike of agricultural laborers and other workers which began in January, 1915, was not only justified but was in the interests of the progress of the island. The long hours, low wages, and exploitation of the laborers could not have been relieved except by their organized action. This is in accord with the testimony of the Government representatives.

15. These laborers, hitherto unorganized, excitable, and filled with a sense of the grievous wrongs which they and their families had suffered, were poorly disciplined and may have been guilty of excesses of speech and action, although there is much evidence to indicate that they were peaceful and law-abiding until provoked by the agents of the employers or by the police.

16. Whatever may have been the actions of the strikers, however, there can be no excuse for the actions of the police and municipal authorities, who violated the personal rights of the strikers, treated them in many cases with wanton brutality, resulting in the death of large numbers, held them in excessive bail, denied them access to the ordinary processes of the courts, and inflicted excessive and unwarranted punishments upon them.

17. The blame for such conditions appears to rest primarily upon the rural police and local magistrates.

18. The demands for legislation made by the representatives of the Free Federation of Labor of Porto Rico appear to be wise and reasonable, but without an opportunity for full local investigation it is impossible to fully indorse them.

It is suggested that the commission recommend provision by Congress for early and thorough investigation of the industrial and social conditions in Porto Rico and all other American colonies.

XXII. CHINESE EXCLUSION.

The investigations with reference to that section of the act which directed the commission to inquire "into the question of smuggling or other illegal entry of Asiatics into the United States or its insular possessions" were made largely under the direction of Mr. E. A. Fitzpatrick and Mr. E. H. Busiek. The extensive evidence collected regarding this entire question is contained in the report of Mr. Fitzpatrick, which is submitted herewith.

The constructive suggestions and recommendations which have been approved by the special subcommittee on Chinese exclusion, consisting of Chairman Frank P. Walsh and Commissioners Harris Weinstock and James O'Connell, and accepted by the entire commission, with reservations as to the agency of administration, are as follows:

CONSTRUCTIVE SUGGESTIONS.

CHANGES IN THE LAW.

The following changes should be made in the law in the interest of administrative efficiency:

1. That the many laws relating to the exclusion of Chinese be codified into a comprehensive statute.

2. That Chinese alleged to have entered the United States surreptitiously shall be tried by administrative process, i. e., on Secretary of Labor's warrant—in all cases irrespective of time of entry or defense of citizenship.¹ At the present time only Chinese alleged to have entered within three years may be tried on Secretary's warrant.

3. That immigration officers be specifically given the power of arrest or taking into custody.

4. That immigration officers be given the right to administer binding oaths in all cases arising under the immigration law.

5. That immigration officials be given the power to compel attendance of witnesses and the production of documentary or other evidence in all cases providing for punishment for contempt.

6. That the attacking of an immigration official or interference with him in the performance of his duties, or any maltreatment of him growing out of the performance of his duties, should be made a penal offense.

7. That the place of deportation to which contraband Chinamen shall be sent may be, in the discretion of the Secretary of Labor, the country whence he came, or the country of his citizenship, or the trans-Atlantic or trans-Pacific port from which he embarked for this continent.

8. That there be a clearer and more definite legislative definition of the exempt and of the admitted classes.

9. That there be a clearer definition of legislative policy as to the status under the immigration and Chinese-exclusion law of Chinamen admitted as exempts and subsequently assuming a nonexempt status.

10. That the pecuniary and family conditions for the return of Chinese laborers in the United States to China be repealed.

11. That the recommendation of a new registration because it is needed to enforce the present law be rejected. This must not be understood to mean a rejection of a new registration law as a part of legislative policy, but solely when it is urged for administrative reasons.

12. That masters of vessels be responsible for every Chinese member of their crew who was on board the vessel when it enters and is not on board when it is ready for clearance.

¹ *The anomalous citizenship situation.*—A Chinese person can not become a citizen by naturalization. The child of a Chinese alien man and woman, who themselves could never become citizens, would be, if born in the United States, an American citizen. The fact that the parents never intend that the child should be an American citizen, and the child itself even when grown up never regards himself as an American citizen except for purposes of the Chinese exclusion law, does not enter into the matter. The child of an American citizen born on foreign soil—China or elsewhere—is an American citizen.

Chinese arrested for being unlawfully in the United States set up the claim of nativity. This claim is in many cases fraudulent. The matter is easy. A Chinaman, when arrested, is told to stand mute, or, if the story has been concocted, he tells a story like this: "I was born in San Francisco [or in some rural place, where there are no records of birth]. My father and mother returned to China when I was four years old. I remained with my clansman, Mr. Y-M-G, who has since returned to China or died. For the past four years I have remained with my uncle, who was at the baptismal—shaving—feast, and can testify to these facts." Uncle testifies. United States commissioner discharges the Chinaman, and if nativity was the defense the citizenship of the Chinaman is res judicata. Thus are citizens made.

A rather dangerous situation is developing in this connection. In one large city of the country definite efforts are being made to vote the Chinaman and have his citizenship established that way. This of necessity brings the question into local politics and complicates further an already awkward situation. This situation ought to be cleared up. The fundamental change required is an amendment to the Constitution.

UNITED STATES COMMISSIONERS.

1. That the jurisdiction of United States commissioners in Chinese-exclusion cases be abolished, or, what is less desirable.¹

2. That the following changes in the system be made: United States commissioners should receive adequate compensation for the service rendered. United States commissioners should be made courts of record and stenographic and other expenses provided for. The Government should be given right of appeal in Chinese cases.

THE JUDICIAL SYSTEM.

1. That the handling of cases of contraband Chinamen should be handled by administrative rather than by judicial procedure.

2. That the present administrative procedure be continued practically without modification, except for the improved handling of appeals as recommended elsewhere in these suggestions.

3. That writs of habeas corpus should be issued only on the basis of a prima facie case.

4. That in criminal cases (smuggling) full sentences should be imposed instead of light sentences as at present.

5. That, if advisable, the cases of contraband Chinamen might be held under the board of special inquiry procedure provided for in cases of immigrants not passed upon primary inspection for admission. The adoption of this suggestion would necessitate the employment of a considerable number of additional men, and for this reason ought not to be adopted immediately.

GENERAL ADMINISTRATION.

1. Definitely withdraw the order of 1905.

2. By conference with Treasury Department provide for more careful sealing and supervision of sealed freight cars crossing the border—

(a) By placing seal number and place of each car on the manifest.

(b) By taking number and place of each seal of each car independently and testing seal.

(c) By comparing local record with manifest immediately.

(d) By examination of contents of each car where there is the least discrepancy or suspicion.

THE SELECTION OF INSPECTORS.

1. That the position of Chinese inspector be revived.

2. That the selection of Chinese inspectors by civil-service examination for general immigrant inspectors be continued.

3. That the present examination be changed in scope as follows:

(a) That all papers now required be omitted except "practical questions."

¹ All interests would be best served by an administrative rather than a judicial procedure in cases of contraband Chinese. As usual, writs of habeas corpus would be issued by the courts in case of arbitrary action or of jurisdiction in these cases.

(b) That greater credit—larger proportion of examination—be given for practical experience in handling the public.

(c) That new examination in report writing be given to include a practical test in condensation—material to relate to immigration, formulation of a report on a given statement of fact, letter writing.

(d) That the examination include a test on Canadian immigration laws.

(e) That it include a test of knowledge of our National Government, particularly of those departments that are related to the work of immigration—

Treasury Department.

Congress.

The judicial system.

Department of State.

(f) That, if possible, an oral examination be included.

(g) That the examination include somewhere questions on the relation of immigration and emigration to a national policy, on immigration as an internal policy, and a general history of immigration.

4. That the examination have specific reference in its questions to immigration work and not be mere general tests.

5. That Chinese inspectors be selected from the more experienced immigrant inspectors who show an inclination and ability in the special requirements of this end of the service.

6. That the probationary period of an immigrant inspector be one year.

CHINESE INTERPRETERS.

1. That in the selection of interpreters the present examination be continued except that, in testing ability to translate or interpret, actual cases be taken in course of routine work rather than the present moot examination.

2. That in securing candidates for positions as interpreters the Immigration Service should look to the large number of Chinese students in our universities, particularly those who are here at the expense of the United States Government (the Boxer indemnity money).

3. That the position of Chinese interpreter be graded into two grades at least, as follows:

(a) Those who can interpret the spoken Chinese of one or more dialects.

(b) Those who can in addition read the written language.

4. That the salary program outlined for inspectors be adapted to the interpreters.

5. That a conference be arranged by the various departments of Government who use interpreters of Chinese to work out some plan of securing honest, capable interpreters—perhaps in cooperation with the universities.

A STAFF ORGANIZATION AT WASHINGTON.

1. That there be established at Washington a staff organization including at least—

(a) Another Assistant Secretary of Labor to handle Chinese appeal cases, etc.

(b) A central law organization providing for the continuous study of the legal aspects of immigration.

(c) A central Chinese smuggling bureau, reenforcing district administration in its attempt to deal with smuggling gangs and other organized smuggling.

(d) A central agency of training and inspection, providing for the continuous supervision and training of the men in the service.

(e) A central clearing house of information and records.

2. That it be specifically made a function of the division of supervision and training to keep district officers informed as to—

(a) Significant court decisions in all districts.

(b) Significant discoveries of district offices, e. g., the Japanese (Korean) passport case.

(c) Effective methods of handling particular situations, e. g., of commissioner who refuses to give full credence to preliminary hearings before immigrant inspectors by bringing contraband Chinamen immediately before commissioner.

(d) Chinese refused papers in any place.

3. That this organization should keep field officers informed as to forward steps and other significant developments.

SALARY PLAN.

1. That the service be regarded for salary purposes as a unit rather than as 23 individual units.

2. That the administrative officers work out a detailed plan of graded salary increases.

3. That there be an annual increase in salary of a definite amount for a definite number of years of service upon certification of meritorious service during the preceding year. On the basis of an initial salary of \$1,380, it seems to us there ought to be an annual increase of at least \$36 per year for 15 years, making a maximum salary of \$1,920. The specific amounts named are offered as suggestions.

4. That positions in the service ought to be graded and correspondingly higher initial salaries provided for the higher grades. The system of annual increases, perhaps of the same amount, ought to be provided here. A larger increase for a less number of years might be advisable. It should be provided in this connection that a man promoted from a lower to a higher position, if he is receiving a higher salary than the initial salary of the higher position, should receive the next higher salary to the salary he is receiving in the lower position. A person standing in a little house watching those who come across an international bridge in Suspension Falls, another doing primary inspection work or board of inquiry work at Ellis Island, another working "under cover" among the thugs of Buffalo and being beaten into insensibility, another doing train inspection work—would receive no pay because of differences of duties. It is submitted that some recognition of this difference in duties ought to find expression in the salary schedule.

5. Superior service should be rewarded both by formal commendation and by salary increases. Two provisions might be included:

(a) The reward for a single brilliant piece of work, such as working under cover with smugglers, risking one's life, and landing the gang in jail.

(b) The provision of a higher annual increase for men giving continuous superior service.

REDISTRICTING.

1. That there be a redistricting of the United States for immigration purposes with more regard to geographical facts and to the efficiency of the service.

2. That district offices take a periodic census in cooperation with the State or National Census or both, or, if necessary, independent of each. (This would help local offices to really see their problems. It would acquaint them with their constituency.)

3. That this census be kept up to date and supplemented by cooperation with municipal and State boards of health and bureaus of vital statistics by recording currently—

(a) Chinese births.

(b) Chinese deaths.

(c) Chinese marriages.

4. That this census be kept up to date and supplemented by making part of the record all the examinations of Chinese in connection with routine and other investigations. A system of cross reference cards should be on file in Washington. It should be kept up to date and supplemented by listing removals and advising as far as possible the district to which the Chinaman moved.

5. That the force should be increased and the whole group of inspectors be organized for regular field work. This should take the place of any system of national arrest crews.

6. That the system of rewards of conductors, trainmen, and policemen who supply information leading to arrests of contraband Chinese or smugglers, which seems now in abeyance, be revived and be provided for in an emergency fund for each district. (Approval of Washington perhaps should be required in each case.)

7. That a business and occupation census of each district accompany the census of persons.

8. That the force of immigrant inspectors assigned to Chinese work be increased.

9. That the equipment to be used in the work of administering the Chinese exclusion law be adequate to cope with the smugglers.

FRANK P. WALSH.¹

JOHN B. LENNON.¹

JAMES O'CONNELL.¹

AUSTIN B. GARRETSON.¹

¹ See supplemental statement.

SUPPLEMENTAL STATEMENT OF CHAIRMAN FRANK P. WALSH.

Charged by your honorable body with an investigation to discover the underlying causes of dissatisfaction in the industrial situation, we herewith present the following findings and conclusions, and we urge for them the most earnest consideration, not only by the Congress, but by the people of the Nation, to the end that evils which threaten to defeat American ideals and to destroy the well-being of the Nation may be generally recognized and effectively attacked.

WE FIND THE BASIC CAUSE OF INDUSTRIAL DISSATISFACTION TO BE LOW WAGES; OR, STATED IN ANOTHER WAY, THE FACT THAT THE WORKERS OF THE NATION, THROUGH COMPULSORY AND OPPRESSIVE METHODS, LEGAL AND ILLEGAL, ARE DENIED THE FULL PRODUCT OF THEIR TOIL.

We further find that unrest among the workers in industry has grown to proportions that already menace the social good will and the peace of the Nation. Citizens numbering millions smart under a sense of injustice and of oppression, born of the conviction that the opportunity is denied them to acquire for themselves and their families that degree of economic well-being necessary for the enjoyment of those material and spiritual satisfactions which alone make life worth living.

Bitterness, bred of unfilled need for sufficient food, clothing, and shelter for themselves and their wives and children, has been further nourished in the hearts of these millions by resentment against the arbitrary power that enables the employer, under our present industrial system, to control not only the workman's opportunity to earn his bread, but oftentimes, through the exercise of this power, to dictate his social, political, and moral environment. By thwarting the human passion for liberty and the solicitude of the husband and father for his own, modern industry has kindled a spirit in these dissatisfied millions that lies deeper and springs from nobler impulses than physical need and human selfishness.

Among these millions and their leaders we have encountered a spirit religious in its fervor and in its willingness to sacrifice for a cause held sacred. And we earnestly submit that only in the light of this spirit can the aggressive propaganda of the discontented be understood and judged.

The extent and depth of industrial unrest can hardly be exaggerated. State and national conventions of labor organizations, numbering many thousands of members, have cheered the names of leaders imprisoned for participation in a campaign of violence, conducted as one phase of a conflict with organized employers. Thirty thousand workers in a single strike have followed the leadership of men who denounced government and called for relentless warfare on organized society. Employers from coast to coast have created and maintained small private armies of armed men and have used these forces to intimidate and suppress their striking employees by

deporting, imprisoning, assaulting, or killing their leaders. Elaborate spy systems are maintained to discover and forestall the movements of the enemy. The use of State troops in policing strikes has bred a bitter hostility to the militia system among members of labor organizations, and States have been unable to enlist wage earners for this second line of the Nation's defense. Courts, legislatures, and governors have been rightfully accused of serving employers to the defeat of justice, and, while counter charges come from employers and their agents, with almost negligible exceptions it is the wage earners who believe, assert, and prove that the very institutions of their country have been perverted by the power of the employer. Prison records for labor leaders have become badges of honor in the eyes of many of their people, and great mass meetings throughout the Nation cheer denunciations of courts and court decisions.

To the support of the militant and aggressive propaganda of organized labor has come, within recent years, a small but rapidly increasing host of ministers of the gospel, college professors, writers, journalists, and others of the professional classes, distinguished in many instances by exceptional talent which they devote to agitation, with no hope of material reward, and a devotion that can be explained only in the light of the fervid religious spirit which animates the organized industrial unrest.

We find the unrest here described to be but the latest manifestation of the age-long struggle of the race for freedom of opportunity for every individual to live his life to its highest ends. As the nobles of England wrung their independence from King John, and as the tradesmen of France broke through the ring of privilege inclosing the Three Estates, so to-day the millions who serve society in arduous labor on the highways, and aloft on scaffoldings, and by the sides of whirring machines, are demanding that they, too, and their children shall enjoy all of the blessings that justify and make beautiful this life.

The unrest of the wage earners has been augmented by recent changes and developments in industry. Chief of these are the rapid and universal introduction and extension of machinery of production, by which unskilled workers may be substituted for the skilled, and an equally rapid development of means of rapid transportation and communication, by which private capital has been enabled to organize in great corporations possessing enormous economic power. This tendency toward huge corporations and large factories has been furthered by the necessity of employing large sums of capital in order to purchase and install expensive machinery, the use of which is practicable only when production is conducted on a large scale. Work formerly done at home or in small neighborhood shops has been transferred to great factories where the individual worker becomes an impersonal element under the control of impersonal corporations, without voice in determining the conditions under which he works, and largely without interest in the success of the enterprise or the disposal of the product. Women in increasing numbers have followed their work from the home to the factory, and even children have been enlisted.

Now, more than ever, the profits of great industries under centralized control pour into the coffers of stockholders and directors who

never have so much as visited the plants, and who perform no service in return. And while vast inherited fortunes, representing zero in social service to the credit of their possessors, automatically treble and multiply in volume, two-thirds of those who toil from 8 to 12 hours a day receive less than enough to support themselves and their families in decency and comfort. From childhood to the grave they dwell in the shadow of a fear that their only resource—their opportunity to toil—will be taken from them, through accident, illness, the caprice of a foreman, or the fortunes of industry. The lives of their babies are snuffed out by bad air in cheap lodgings, and the lack of nourishment and care which they can not buy. Fathers and husbands die or are maimed in accidents, and their families receive a pittance, or succumb in mid-life and they receive nothing.

And when these unfortunates seek, by the only means within reach, to better their lot by organizing to lift themselves from helplessness to some measure of collective power, with which to wring living wages from their employers, they find too often arrayed against them not only the massed power of capital, but every arm of the Government that was created to enforce guaranties of equality and justice.

We find that many entire communities exist under the arbitrary economic control of corporation officials charged with the management of an industry or group of industries, and we find that in such communities political liberty does not exist, and its forms are hollow mockeries. Give to the employer power to discharge without cause, to grant to or withhold from thousands the opportunity to earn bread, and the liberties of such a community lie in the hollow of the employer's hand. Free speech, free assembly, and a free press may be denied, as they have been denied time and again, and the employer's agents may be placed in public office to do his bidding.

In larger communities where espionage becomes impossible the wage earner who is unsupported by a collective organization may enjoy freedom of expression outside the workshop, but there his freedom ends. And it is a freedom more apparent than real. For the house he lives in, the food he eats, the clothing he wears, the environment of his wife and children, and his own health and safety are in the hands of the employer, through the arbitrary power which he exercises in fixing his wages and working conditions.

The social responsibility for these unfortunate conditions may be fixed with reasonable certainty. The responsibility, and such blame as attaches thereto, can not be held to rest upon employers, since in the maintenance of the evils of low wages, long hours, and bad factory conditions, and in their attempts to gain control of economic and political advantages which would promote their interests, they have merely followed the natural bent of men involved in the struggle of competitive industry. The responsibility for the conditions which have been described above we declare rests primarily upon the workers who, blind to their collective strength and oftentimes deaf to the cries of their fellows, have suffered exploitation and the invasion of their most sacred rights without resistance. A large measure of responsibility must, however, attach to the great mass of citizens who, though not directly involved in the struggle

between capital and labor, have failed to realize that their own prosperity is dependent upon the welfare of all classes of the community, and that their rights are bound up with the rights of every other individual. But, until the workers themselves realize their responsibility and utilize to the full their collective power, no action, whether governmental or altruistic, can work any genuine and lasting improvement.

Fourteen years before Abraham Lincoln was called to the high office where he immortalized his name, he uttered these great truths:

Inasmuch as most good things are produced by labor, it follows that all such things of right belong to those whose labor has produced them. But it has so happened in all ages of the world that some have labored and others have without labor enjoyed a large proportion of the fruits. This is wrong and should not continue. To secure to each laborer the whole product of his labor, or as nearly as possible, is a worthy subject of any good Government.

With this lofty ideal for a goal, under the sublime leadership of the deathless Lincoln, we call upon our citizenship, regardless of politics or economic conditions, to use every means of agitation, all avenues of education, and every department and function of the Government, to eliminate the injustices exposed by this commission, to the end that each laborer may "secure the whole product of his labor."

FRANK P. WALSH.

NOTE.—Chairman Frank P. Walsh also presented the following dissenting opinion:

Although I have signed the report prepared by Mr. Basil M. Manly, director of research and investigation, because I believe it represents an unassailable statement of the existing industrial situation, because it fully complies with the requirements of the act of Congress creating the commission, and because the recommendations are as a whole wise and necessary for the welfare of the Nation, I, nevertheless, desire to record my dissent on the following points:

1. The recommendation for new administrative machinery for mediation and arbitration in the form of a special commission. I believe that the commission created by the Newlands Act, and the Department of Labor, if their powers are enlarged and they are adequately supported, will be fully able to deal with the situation.

2. The recommendations for a literacy test as a method of restricting immigration. I wish to record my opposition, as a matter of principle, to all restrictions upon immigration.

3. The recommendations regarding civil government in such isolated communities as coal camps, which I believe can not be adequately dealt with except by the Government taking over all coal lands and leasing them upon terms which will make possible their operation upon a cooperative basis by the workers.

Notwithstanding many meritorious statements contained in the report of Commissioners John R. Commons and Florence J. Harri-man, I feel it my duty to dissent from the same in toto, for the reasons following:

1. It wholly fails to comply with the law creating the commission, in that it does not set forth the facts regarding the condition of labor in the leading industries of the United States and the underlying causes of industrial dissatisfaction.

2. The whole scheme of the control of labor, and the laws governing the same, is undemocratic and not in accord with the established principles of representative government.

3. The entire plan suggested is opposed to the habits, customs, and traditions of the American people.

4. The suggestions in the main are impractical and impossible of performance.

5. It opens up unlimited opportunities for graft and corruption.

6. If the ponderous legal machinery provided for in this report could be put in operation throughout our Nation, it would mean—

(a) that the economic condition of the workers of the country would be absolutely subjected to the whim or caprice of an army of officials, deputies, and Government employees, and (b) the establishment of an autocratic control over the business operations of manufacturers, merchants, and other employers, repugnant to American standards of freedom in manufacture and commerce.

SUPPLEMENTAL STATEMENT OF COMMISSIONER AUSTIN B. GARRETSON.

My signature is appended to the report of Mr. Basil M. Manly, director of research and investigation of the United States Commission on Industrial Relations, submitted to the commission and transmitted herewith, as to the findings of fact contained therein.

I am in general agreement with the recommendations contained in that report except as to the formation of the system of State and Federal commissions and a Federal industrial council.

On this recommendation I neither approve nor condemn. But out of regard for the opinion of the great body of intrastate labor most directly affected, I dissent.

I am also in accord with the statement of fact contained in the report of George P. West on the Colorado situation.

I am favorable to the extension of the provisions of the Newlands Act to all classes of interstate employees who can constitutionally be brought under its provisions and would favor the enlargement of the body administering it to meet the added responsibilities which would thereby be placed upon it, but limiting the powers thereof to the settlement of industrial disagreements and to the gathering of information germane to their mission.

I favor the creation of State commissions, similarly constituted and acting in correlation and understanding with the Federal board.

I heartily concur with the report of Commissioners Lennon and O'Connell except on those points where disagreement is herein noted. I dissent in whole from report rendered by Commissioner J. R. Commons. I render individual opinion and suggestion only on—

CAUSES UNDERLYING INDUSTRIAL UNREST.

Any student who accepts and applies the belief that the "proper study of mankind is man" can not fail to trace certain fundamental causes, general in their character, which underlie industrial unrest which will continue to grow until either the causes are peacefully removed or revolution ensues.

To me there appear to be four of these basic causes.

The first lies in the inequitable distribution of the fruits of industry.

Our industrial system makes it possible for one man, in only a portion of the span of human productive life, to take unto himself and claim as his own a fortune of a hundred million dollars or more, while millions of deserving men, availing themselves of every opportunity for unremitting toil, are only able to secure a grave in the potters' field or else burden their families with an installment debt for the cost of interment.

The creation of such colossal fortune naturally breeds in the mind of the possessor the sentiment, belief, and practice that he is superior to society and not subject to the law. The possession thereof makes him unregardful of the opinions of society or of the mandates of the law, incites him to disregard and hold himself independent of the moral precepts and beliefs of society and tends toward the effort to prostitute the administration of justice, and under the present system renders him practically immune from the penalties prescribed by the law.

The transmission to heirs or trustees, degenerate or otherwise, of fortunes so vast or of business interests so far-reaching makes them the virtual arbiters of the destiny of hundreds of thousands of their fellow beings in regard to whom they have neither sympathetic feeling, intelligent interest, nor humanitarian desire, and the testimony before this commission has made it evident that in some instances these heirs or representatives even resent the imputation that any obligation whatever can rest upon them for the welfare of the said fellow beings or that even intelligent knowledge as to what would constitute well-being should be required of them.

Second, the methods of the formation and administration of law would in themselves justify undying, righteous unrest from the fact that they create, encourage, and demonstrate knowledge and belief that there is no equality before the law as between the man who has and the man who has not.

Primarily there is the trend through legislation to exalt the property right at the expense of the personal right. Next, the tendency of a great majority of our courts to extend and amplify this trend. This appears in the declaring unconstitutional of a great portion of the legislation that in later years is appearing if it in any way restricts the rights of property, while at the same time any legislative act which tends to make effective the constitutional, personal right of the individual is nullified upon the same ground.

In other words, to exalt money above man.

The tendency also of a large number of the same tribunals is to legalize the maintenance of armed forces, either by the corporation or the large individual employer, and the virtual levying of war through the use of the State militia as a private guard for property interests, or as an economic weapon for the purpose of prejudicing the interests of the worker, is abetted and approved, while at the same time rigorously prosecuting and punishing the individual for taking any similar action, individually or collectively, in defense of his person or his family.

Thus the man who uses a deadly weapon to protect himself or his home against the aggression of hired thugs has set in motion against him the whole machinery of the State, while the corporation which enlisted, equipped, and paid a private armed force, formed and used not for the maintenance of peace or the protection of property but solely as an economic weapon, is lauded as a conservator of peace, law, and order.

Our laws deal strictly and effectively with those who contribute to the delinquency of an individual, but the hirelings of a corporation may debauch a State for their own economic gain and receive only laudation from those who "sit in the seats of the mighty."

The man who, on account of hunger of himself or family, steals a loaf is held up to public view as a "horrible example" of the increase of crime and decadence of the moral sense, while he who exploits the public or by dishonest or fraudulent representation or manipulation secures millions of their money is by the same agencies held up to the youth of the land as an example of what intelligent effort and devotion to business may accomplish.

The system of wholesale arrests during industrial disturbances for acts which, committed under ordinary conditions and when no industrial disturbances prevailed, would not constitute ground for arrest, is one of the significant indications of the use of governmental agencies, not as a preserver of peace but as a purely economic weapon.

The intrusion of what has been aptly described as "invisible government" into all the channels of life—the educational system, primary, secondary, and higher, the church, the press, the legislative branch, and the judicial system—and the recognized potency of its meretricious efforts contributes its elements to the whole.

Third, irregularity of employment, with the consequent restriction of opportunity and with its consequent extension of belief that unremitting toil under present conditions can bring no fair recompense, thus stifling healthy incentive to labor, is creating an army of unemployed that must, in the last analysis, be reckoned with, and unless remedy is found whereby incentive may be restored and recompense be made apparent, society itself must pay the forfeit.

Fourth, land monopoly with resulting prohibitive price, the greatest influence in creating congestion in the cities, bears its own share of the responsibility for unrest.

Tracing the history of every vanished civilization makes apparent the fact that in every instance decadence was preceded by urban congestion and by immense land holdings by the aristocrat or the capitalist.

As to the remedy for these evils, an income and inheritance tax that would be, above a certain figure, absolutely confiscatory would make impossible, first, the creation, and, second, the transmission of the dominating accumulation of wealth in the hands of any individual, group, or family. When the unlimited power of reward or purchase had ceased to exist, the subconscious tendency of legislatures and of those who interpret and administer the law to be subservient to property interests would of necessity disappear.

It is worth consideration as to whether or not a limitation can properly be set upon profit in a business enterprise.

Every code, ancient and modern, prescribes penalties for usury, and modern codes define the rate of interest permitted. Therefore, if a man loans money, he can only demand what is described as the legal rate for the use thereof.

Is it, or is not, equally consistent for the Government to prescribe a rate beyond which profit shall not extend?

In the question of dealing with land, should not the same doctrine be applied to land that in the arid States is applied to water, i. e., that no more land can be held by an individual than he can put to productive "use," thus making unused land revert to the State and acquirable by those who would utilize it?

A. B. GARRETSON.

SUPPLEMENTAL STATEMENT OF COMMISSIONERS JOHN B.
LENNON AND JAMES O'CONNELL.

Our signatures are appended to the report of Mr. Basil M. Manly, director of research and investigation of the United States Commission on Industrial Relations, submitted to the commission at its session held in Chicago during the months of July and August, 1915, except that portion of the report recommending a system of mediation, conciliation, investigation, and arbitration, applicable to both State and Nation, which proposes to create a commission of three members, together with an advisory council of 20 members, 10 representing employers and 10 representing employees. The entire plan is set forth in the report of the staff as submitted to the Commission on Industrial Relations; also in a report to the commission by Prof. George E. Barnett, and also in the report of Commissioner John R. Commons. From these recommendations we dissent for reasons assigned in this statement.

The evidence submitted to the commission at public hearings, together with the evidence secured by special investigators, has been fairly set forth in Mr. Manly's report and with even justice to all, whether employers, employees, or the public.

CRITICISMS NOT JUSTIFIED.

Our fellow commissioners who are representatives of the employers contend in their statement that the report of Mr. Basil M. Manly for the staff is deficient in that it does not properly present an indictment against labor on the grounds of fostering and promoting violence in trade disputes, jurisdictional disputes accompanied by strikes, limitation of output, sympathetic strikes, contract breaking, apprenticeship rules, refusal to use nonunion materials, alleged graft, and so forth, and that it does not include these things among the fundamental causes of industrial unrest. All the evidence submitted to the commission, as we understand and interpret it, proves that these things, in so far as they do exist, are in no sense causes of industrial unrest but, on the contrary, are evidences of existing industrial unrest and are evils that are incidental to a situation wherein labor has at times been forced to fight with such weapons as it could command for advantages and rights that in justice should be freely accorded to the wage earners. So long as labor organizations are forced by employers to fight for the mere right to exist, and so long as wages paid to labor are so low that the unorganized wage earner often sees no choice except that between resorting to such weapons or seeing himself and his family sink below the poverty line, just so long will these evils at times manifest themselves as symptoms of the worker's desperation. The union, fighting for its right to live, is sometimes forced to tolerate

acts that would not be countenanced if its entity were secure and its energies were not absorbed in fighting for existence.

STRONG ORGANIZATIONS THE CURE.

Experience shows that the evils complained of rapidly disappear in labor organizations as soon as the organization prevails over the opposition of the employers and establishes its right to organize. Strong unions mean decent wages, and decent wages raise wage earners to a plane of thought and action where all their acts and mental processes must no longer be directed toward a desperate struggle for the very right of themselves and families to live.

Organized labor fully realizes how unfortunate it is that labor in its struggle for existence has occasionally been driven to consider its immediate advantage at the expense of the true economic principles that must govern in the long run. All the energies of organized labor's representatives have been exerted to minimize or eliminate any tendency toward limitation of output or jurisdictional disputes, but, at the same time, organized labor insists that these tendencies where they exist are the logical and inevitable outgrowth of evils in industry that can be removed only by trade-union action by the wage earners. We could cite evidence at great length to show that the tendencies complained of, so far as they exist at all, have grown out of the hard necessities with which labor has been confronted. It is enough here to quote briefly from the testimony of the distinguished economist, Prof. Jacob H. Hollander, of Johns Hopkins University, given before this commission in New York City on January 20, 1915. Prof. Hollander in discussing the limitation of output said:

We lose sight of the fact that trade-unions and unionists are not soldiering in the matter, but they are animated by a very high degree of fraternity in the matter, that they are willing to adopt the same principle if it is a matter of piecework instead of time work; that the endeavor of society should be to bring back industrial conditions from that unwholesome mess into which they have slumped from this abnormal disproportionate allotment of workers to particular fields in excess of the requirements in those fields. We must without deviating one iota from the proposition which you have stated that it is socially unsound that workmen should do less than they properly could—society should seek to bring about conditions where they will do what they can without involving displacement and unemployment on the part of their fellow workmen.

We hold that the report of Mr. Manly contains no statement that is unworthy of credence, and that will not bear careful investigation. The conclusions and recommendations are warranted by the statement of facts and the accumulated evidence in the hands of the commission.

THE EVIDENCE.

All evidence accumulated, whether by special investigators or at public hearings, will be submitted to Congress, and we trust the people of our country will demand that it be published in full, particularly the following, which are well worth the most careful study by all persons interested in human welfare. The reports cited below have been prepared by competent investigators and were submitted to the commission after careful investigation and verification by

Director Basil M. Manly and by members of the commission, and are the latest information upon the various subjects covered by them.¹

Evidence Taken at All Public Hearings.

Causes of Industrial Unrest, by Mr. W. J. Lauck.

Violence in Labor Disputes, by Mr. Luke Grant.

Structural Iron Workers, by Mr. Luke Grant.

Sickness Prevention and Insurance, by Dr. B. S. Warren.

Mediation, Arbitration, and Investigation, by Prof. Geo. E. Barnett.

Conditions of Labor in Principal Industries, by Mr. Edgar Sydenstricker.

Efficiency Systems in Industry, by Prof. Robert F. Hoxie, Mr. John P. Frey, and Mr. Robert G. Valentine.

Industrial Education, by Commissioner John B. Lennon.

Labor Complaints and Claims, by Mr. P. A. Speak.

Trade-Union Law, by Mr. J. W. Bryan.

Colorado Situation, by Mr. George P. West.

The Telephone and Telegraph Industry, by Mr. Christopher T. Chenery.

Labor Conditions in Porto Rico, by Mr. Christopher T. Chenery.

Labor Conditions in the Black Hills, by Mr. William P. Harvey.

Labor Conditions in Los Angeles, by Mr. William P. Harvey.

Preliminary Report on the Land Question, by Mr. Charles W. Holman.

Agricultural Labor and Tenancy, by Mr. John L. Coulter.

Unemployment, by Mr. William M. Leiserson.

Extent and Growth of Labor Organizations, by Mr. Lee Wolman.

Injunctions in Labor Disputes, by Mr. Edwin E. Witte.

The Inferior Courts and Police of Paterson, N. J., by Mr. Redmond S. Brennan and Mr. Patrick F. Gill.

Chinese Exclusion, by Mr. Edward A. Fitzpatrick.

EXTENT OF UNREST.

The principal duty imposed, under the law creating the commission, was to seek to ascertain the causes of industrial unrest and offer such recommendations as we believe might alleviate that unrest. There can be no question but that unrest exists, in some instances, to an alarming extent. Thousands and tens of thousands of our people feel that they are deprived, under existing conditions in industry, of an opportunity to secure for themselves and their families a standard of living commensurate with the best ideals of manhood, womanhood, and childhood. They resent the fact that the existing system of the distribution of wealth creates at one end of our industrial scale a few multi-millionaires and at the other end thousands and tens of thousands of men, women, and children who are at all times in a situation where they are uncertain as to where their next meal will come from. Hungry, poorly clothed, and without the opportunities that a fully rounded life requires, they become filled with a sullen resentment that bodes no good for the future of our Republic.

We have found men and women who are inclined to ascribe this condition to the fact that the Government exercises no power of mandatory character to prevent strikes and lockouts. Many have

¹ These reports have not been printed with this document, on the recommendation of Chairman Frank P. Walsh, as stated in his letter in Senate Report No. 143, Sixty-fourth Congress. The reports on Structural Iron Workers and the Colorado Situation were printed by the commission itself in 1915.

been the propositions submitted to us for compulsory arbitration or, at least, compulsory investigation with power to recommend a settlement. Some have proposed an elaborate machinery, to be set up by the General Government, and of a similar character by the States, providing for conciliation, mediation, arbitration, and investigation, all of which, while without definite compulsory features, establishes a legal machinery that must of necessity exercise an influence in that direction.

The plan for the creation of an industrial commission, both national and State, proposes to assign to a commission of three members the administration of all labor laws of either State or Nation, giving to them powers far in excess of those exercised by the President of the United States or the governor of any State. This we believe to be bureaucracy run mad, and a subversion of democracy dangerous to the civil and social liberty of all citizens. We hold that all power should be, in the final analysis, with the people, and we, therefore, dissent from any such plan.

NEW GOVERNMENTAL MACHINERY UNWISE.

The activities of such a commission, supplemented by the proposed advisory committees of employers and labor representatives, would be so balanced as to prevent substantial progress and tend to perpetuate present conditions. Such a plan conceives of labor and capital as static forces and of the relations between them as always to remain unchanging.

We believe that the work now being done by the Department of Labor in industry generally, and by the Board of Mediation and Conciliation, dealing with interstate public utilities, is better than any that could be expected of any additional board that has been suggested to this commission. We believe that the Department of Labor, with further experience and larger appropriations, will develop a high state of efficiency in adjusting labor disputes that are capable of being adjusted by anyone other than the parties directly interested and will adequately carry on the work provided by the law creating the Department of Labor, to wit:

SECTION 1. The purpose of the Department of Labor shall be to foster, promote, and develop the welfare of the wage earners in the United States, to improve their working conditions, and to advance their opportunities for profitable employment.

SEC. 8. The Secretary of Labor shall have power to act as mediator and to appoint commissioners of conciliation in labor disputes whenever in his judgment the interests of industrial peace require it to be done.

We favor the extension of the Newlands Act to cover all employees engaged in interstate commerce, such as the railroad telegraphers, the shop and track men employed by railroads, the employees of express companies, of the Pullman Co., of commercial telegraph and telephone companies, and other public utilities performing interstate service that, in the interest of the Nation, must be continuous.

The evidence submitted to this commission is substantially to the effect that where trade-union organization exists among the workers, there, at the same time, exists the least amount of industrial unrest of a character that is dangerous to the peace and welfare of our Nation. It is true that the union men and women are not satisfied with their conditions; they are not, however, despondent as to the

possibility of securing better conditions; they know what the unions have accomplished, and they have an abiding faith that their further desires can be attained.

Instead of any elaborate machinery for the prevention of strikes or lockouts we are convinced, from the testimony gathered by this commission, that the most effectual course that can be pursued to bring about general contentment among our people, based upon a humane standard of living, is the promotion of labor organization. The most casual investigator will soon discover that in those lines of industry where organization of labor is the strongest, there is the least danger of industrial revolt that would endanger the fundamental principles of our Government and the maintenance of a nation with respect for law and order. Where organization is lacking dangerous discontent is found on every hand; low wages and long hours prevail; exploitation in every direction is practiced; the people become sullen, have no regard for law or government, and are, in reality, a latent volcano, as dangerous to society as are the volcanoes of nature to the landscape surrounding them.

THE ONE TRUE REMEDY.

We therefore urge as the great remedy for such unnecessary industrial unrest as we have found more, and more, and still more organization of labor and of the employers in each industry as well. The education of the trade unions has been conducive to a higher and better citizenship. In recent years there have come to our assistance scores and hundreds and thousands of people outside the ranks of unionists—ministers, professors, journalists, professional men of all kinds—who have reached the conclusion that is herein stated, that the most efficient cure for such industrial unrest as should be cured, is union organization.

We hold that efforts to stay the organization of labor or to restrict the right of employees to organize should not be tolerated, but that the opposite policy should prevail, and the organization of the trade unions and of the employers' organizations should be promoted, not, however, for the sole purpose of fighting each other, but for the commendable purpose of collective bargaining and the establishing of industrial good will. Organizations of employers that have no object in view except to prevent labor having a voice in fixing the conditions of industry under which it is employed have no excuse for existence, as they are a bar to social tranquillity and a detriment to the economic progress of our country. The evidence before the commission shows that organized labor has no desire, nor has it attempted, to control the business of the employer. It insists that it has a right to a voice, and a potent voice, in determining the conditions under which it shall work. This attitude, we are sure, will be continued in spite of the opposition of any so-called employers' organizations. This country is no longer a field for slavery, and where men and women are compelled, in order that they may live, to work under conditions in determining which they have no voice, they are not far removed from a condition existing under feudalism or slavery.

In emphasizing with all the force at our command the necessity of collective action by wage earners through strong organizations, if

the problem of industrial unrest is to be solved, we wish again to quote from testimony of Prof. Hollander. He undertook to sum up for this commission those conclusions regarding the solution of this problem that have been reached not only by himself, but by the great body of economists in this country and abroad. He said:

The opinion of political economists in so far as I can voice it is that social unrest, which is manifest not only in this country but in every industrial country, is due to the existence of economic want or poverty, if by that we understand not on the one hand pauperism or on the other economic inequality. By poverty I mean the existence of large areas of industrial society in receipt of incomes less than enough to maintain themselves and those dependent upon them in decent existence. We believe that is the consequence, not of any absolute dearth—that the world produces enough to go around; that it is, therefore, not a question of insufficient production, but of defects in distribution. * * * There is a view among economists that there is nothing in any current theory of wages that precludes the laborer from obtaining a sufficient wage, and that if he fails it must be in consequence of the fact that he enters into the wage contract on a plane of inequality. The wage contract, in short, is the result of a bargain between the employer and the employee, and if the employer is in a superior competitive position by reason of combination and the laborer is unorganized he is at a bargaining disadvantage which is certain to redound to his hurt.

I think political economists accordingly then are in agreement that trade unionism is essential as a means of bringing the workmen into industrial bargaining on a plane of equality.

* * * * *
 You have asked specifically what the remedy [for poverty] is. It means a very decided revulsion of opinion as to trade unionism. The general attitude among employers of labor is often open and decided opposition to organized labor. Until society recognizes the unwisdom of that attitude and demands that the laborer must enter into his wage bargain on a plane of competitive equality, society has not lifted its finger to remedy that evil.

THE PUBLIC'S DUTY.

We submit the report of Mr. Basil M. Manly as our report, asking for it the fullest possible consideration by the men and women of our country who are interested in the social and moral uplift of humanity.

Labor must work out its own salvation. Wageworkers can attain that degree of well-being to which they are entitled only by their own efforts. The general public can not be expected to do for them what they fail to do for themselves, nor would it be desirable that those rights and benefits to which they are entitled should be handed down to them by the Government or by organized society as grace from above. But the general public is vitally interested in the efforts of wageworkers to win for themselves equal justice and such a degree of material well-being as will enable them to maintain themselves and their families in comfort, security, and health. Society's interest in the triumph of labor's cause should spring not only from the love of justice and the human sympathy that animates every good citizen,

but from a realization that industrial and social evils menacing large groups of the population can not continue without eventually bringing disaster to society as a whole. While inviting the aid of every good citizen, we, as representatives of organized labor, urge that this aid be directed not solely to seeking new legislation or new governmental machinery designed as a cure-all, but to giving moral support to labor's own efforts, and insisting that trade unions be fostered and encouraged as the most effective agencies making for the wage-workers' progress.

We concur in, and adopt as a part of our report, the statement under the heading "Supplemental statement of Chairman Frank P. Walsh."

We concur in the dissenting opinion of Chairman Frank P. Walsh from the report of Commissioners John R. Commons and Florence J. Harriman.

We concur in that part of the report of Commissioner Austin B. Garretson under the heading "Causes underlying industrial unrest."

We concur in the history and statement of facts regarding the Colorado strike, as written by Mr. George P. West, which is printed as an addendum to this report.¹

JOHN B. LENNON.
JAMES O'CONNELL.

¹The report by Mr. George P. West has not been printed with this document, on the recommendation of Chairman Frank P. Walsh, as it was printed by the commission itself in 1915. See his letter in Senate Report No. 143, Sixty-fourth Congress.

REPORT OF COMMISSIONERS JOHN R. COMMONS AND FLORENCE
J. HARRIMAN.

ENACTMENT, INTERPRETATION, AND ENFORCEMENT OF LABOR
LAW.

We can not find ourselves able to agree to any of the findings or recommendations of the staff or any resolutions based upon them, because they have not the criticism of employers, employees, and others affected by them, which we consider indispensable in order that we might have before us assurance that they were accurate and not chargeable with important omissions. These reasons are stated more fully in paragraph 4 following, and are equally appropriate for those who refuse to sign this report. We find ourselves unable to agree with other recommendations and resolutions for legislation, because they contain few or no practicable suggestions for legislation that would be enforceable, or because they are directed to making a few individuals scapegoats, where what is needed is serious attention to the system that produces the demand for scapegoats, and with it the breakdown of labor legislation in this country. In this way we interpret the act of Congress which requires us to inquire "into the scope, methods, and resources of existing bureaus of labor and into possible ways of increasing their usefulness." From our personal experience we agree with many of the alleged findings and with the objects intended to be accomplished by the enactment of proposed laws, but we consider that it is not worth while to propose any more laws until we have provided methods of investigation, legislation, and administration which can make laws enforceable. A law is really a law only to the extent that it is enforced, and our statute books are encumbered by laws that are conflicting, ambiguous, and unenforceable, or partly enforced. Here is probably the greatest cause of industrial unrest, for as soon as people lose confidence in the making of laws by the legislature, in their interpretation by the courts, and in their administration by officials, they take the law into their own hands. This is now being done by both employers and employees. Before recommending any additional much-needed laws affecting wages, hours, child and woman labor, unemployment, or other substantive laws to improve industrial conditions, we must call attention to the widespread breakdown of existing laws and must devise methods of revising them and enacting and enforcing new laws so that they will fit actual conditions and be enforceable and enforced. With the widespread demand for more laws to remedy widespread and well-recognized causes of industrial unrest, there is a curious feeling that, if only more laws are placed on the statute books, they will, in some unexplained way, get themselves enforced.

While recognizing the justice of much of this demand for new laws, we are not placing them first in our report, but rather the methods of investigating conditions, of enacting legislation, of judicial interpretation, and administrative enforcement necessary to make them worth while as a real remedy.

Other industrial nations have gone far ahead of the United States in adopting labor legislation, much of which is also needed here; but their laws are drawn up so as to be enforceable, and their machinery of enforcement is such that the people are willing to entrust new laws to their officials for enforcement. Our Government is different from theirs and requires different methods, but, if our methods and officials can not be made as effective and trustworthy as theirs, then we can not trust more laws than we now have to their hands.

One of the most important facts to be recognized is that governments, whether State or Federal, can not be looked to alone for remedying evil conditions. As soon as people come to look upon the coercive power of government as the only means of remedying abuses, then the struggle for control of government is substituted for the private initiative through private associations, from which the real substantial improvements must come. We must look for the greatest improvement to come through the cooperation with government of the many voluntary organizations that have sprung up to promote their own private interests. The most important ones, for our purposes, are employers' associations, labor unions, and farmers' organizations. These are directly affected by most labor legislation, and they have much more powerful influence than have unorganized interests upon legislatures and administrative officials.

Furthermore, the struggle between capital and labor must be looked upon, so far as we can now see, as a permanent struggle no matter what legislation is adopted. If this is not recognized, proposed remedies will miss the actual facts. But there are certain points where the interests of capital and labor are harmonious or can be made more harmonious. In fact, this field where there is no real conflict between employers and employees is much wider than at first might be imagined. By recognizing these two facts of permanent opposition and progressive cooperation, it may be possible to devise methods of legislation, court interpretation, and administration which will reduce antagonism and promote cooperation. For, while we can not look to government alone for remedying abuses, it is only by legislation that we can give voluntary organizations a greater share in working out their own remedies and in cooperating with government toward increasing the points of harmony.

Some progress has been made in this direction in the past few years in some States, through the enactment of laws creating industrial commissions, but none of these laws go to the full extent required in order to carry out the foregoing principles. By observing the strong and weak points of these laws, as well as those of other States and the Federal Government which have not adopted similar laws, we can draw certain conclusions, which we do in the form of recommendations. A draft of a bill embodying most of these recommendations was submitted to the legislatures of Colorado and New York during the legislative sessions of 1915 and was adopted with more or less serious modifications and additions by those legislatures. The

recommendations below contain most of the terms of the foregoing draft and also of improvements which seem essential to be made in the industrial commission laws of the States and of proposed laws for State or Federal Governments. Some of the recommendations are based on personal experience in the administration of labor laws.

INDUSTRIAL COMMISSIONS.

1. State and Federal industrial commissions to be created for the administration of all labor laws. All bureaus or divisions dealing with conditions of labor, including industrial safety and sanitation, workmen's compensation, employment offices, child labor, industrial education, statistics, immigration, and so on, to be placed under the direction of the commission. Each commission to consist of three commissioners to be appointed by the governor or President, as the case may be, with the consent of the Senate. Members to be appointed with the advice of the advisory representative council. (See par. 2.) The term of each commissioner to be six years, except that the terms of the commissioners first appointed shall be so arranged that no two shall expire at the same time. The Federal Department of Labor to be retained for educational and political purposes, and a similar department might be created in large industrial States, such as New York and Pennsylvania.

The tendency of labor legislation in the States which have given attention to this matter has been toward a complete centralization of the administration of the labor laws in the hands of a single department. Wisconsin in 1911 established an industrial commission for the administration of all labor laws, and Ohio, after one year of separate administration of the compensation law, created in 1913 a similar commission, and incorporated the compensation commission into an industrial commission. In New York and Pennsylvania the responsibility for the administration of labor laws has been divided between a commissioner of labor, who is responsible for their enforcement, and an industrial board of five members, the sole duty of which is to make necessary rules and regulations having the force of law. In New York there has also been a separate commission for the administration of the compensation act. The tendency, however, is strongly toward the industrial commission plan, as the New York plan, which was devised at the time of the reorganization of the labor department of that State in 1913 and adopted in the same year by Pennsylvania in an act largely copied from the New York law, has already (1915) been given up in the State of its origin. The New York commission under the law of 1915 consists of five members, and is charged with the administration of all labor laws and the workmen's compensation law, and also with the duty of making the rules and regulations for carrying these laws into effect. In Pennsylvania a compensation act has this year (1915) been enacted, and, while no change has been made in the organization of the labor department, the administration of the compensation act has been intrusted to that department.

During the present year (1915) at least five States have enacted legislation for a closer union of the administration of their labor and compensation laws. Colorado, with serious modifications, and Indiana have enacted laws creating industrial commissions similar to

those of Wisconsin and Ohio. Nevada has created an industrial commission of three members for the administration of its compensation act and has conferred upon one of the commissioners, to be designated as commissioner of labor, the duty of enforcing all laws of the State for the protection of the working classes. In New Jersey, after an unsuccessful attempt to create an industrial commission, provision has been made for two additional employees in the department of labor for the purpose of correlating the work of that department with the administration of the compensation act.

In California the industrial accident commission administers the compensation act and also laws dealing with safety in places of employment, although the labor bureau also has the latter authority; and in Massachusetts, while there are still separate boards in charge of the labor department and of the administration of the compensation law, the two boards sit jointly for the purpose of making rules and regulations for the prevention of industrial accidents and occupational diseases.

In several States bills have been introduced for the creation of an industrial commission for the administration of all such laws. In New Jersey such a bill was introduced by the president of the State Federation of Labor, who is also a member of the assembly, and in Maryland such a bill was prepared and introduced at the instance of the State labor department. In Illinois the report of the efficiency and economy committee recommended the consolidation of the various departments dealing with labor laws, including the board administering the compensation act, and in Missouri a legislative committee, after a careful study of the subject, reported in December, 1914, in favor of the enactment of a compensation law and the creation of an industrial commission to administer both it and the other labor laws of the State. This latter report is particularly important, because it represents the result of a recent official study of the problem and consideration of the experience of the States which have advanced labor laws.

As already explained, the fundamental principle of these recommendations is that the administration of all the labor laws of a State shall be centralized. An illustration of the advantages is found in uniting the administration of the labor laws relating to safe and sanitary conditions of employment with the administration of the workmen's compensation laws.

It is probably unnecessary at this stage of the development of workmen's compensation legislation to consider the question whether there should be a responsible officer or officers charged with the administration of such laws, or whether their administration should be left to individual initiative and the final determination of courts of law, already burdened with many other and equally important responsibilities. That question is settled, and the only point is as to the character of the administrative agency. Both the nature of the compensation laws and the experience which has been gained during their operation in many States point to a board or commission, instead of the courts, as the best form of administration. Economy of administration then is secured if the administration of safety laws is placed in the hands of the compensation commission. Fewer highly paid executive officers and other employees are required, and there

is secured avoidance of duplication in the work itself. For example, it is essential to the administration of both these laws that employers should be required to make reports of accidents. On the one hand they furnish necessary information respecting the nature of accidents and the possibilities of prevention; on the other, they are necessary in the actuarial work involved in the administration of compensation. The same is true of the inspections which are frequently necessary in the course of the administration of both laws and in most instances one inspection would serve both purposes. Furthermore, the information derived from hearings in compensation is of great assistance to the commissioners, who are also charged with responsibility of the labor laws generally, in giving them a broader view of the problems with which they are dealing.

The same kind of events that have led up to the State industrial commission are taking place in Federal legislation. Already two bills on workmen's compensation have been well advanced and one of them creates a commission separate from the Department of Labor. The bill for compensation of employees of the Government (63d Cong., 2d sess., H. R. 15222) takes the place of the present law administered by the Department of Labor, and provides for a "United States Employees' Compensation Commission" consisting of three commissioners, no one of whom shall hold any other Federal office or position. The other (63d Cong., 1st sess., S. 959), providing for employees of private employers in interstate commerce, leaves the administration of the law to the courts, a method that has been effectually discredited. Whether either or both bills on workmen's compensation are adopted, they should be united, as already shown in the case of the States, under a commission that administers the safety laws.

When the Department of Labor was created the important work of safety for mine workers was left in the Department of Interior under the Bureau of Mines. Safety on railroads is in the hands of the Interstate Commerce Commission. The Bureau of Standards, of the Department of Commerce, develops safety standards for electric and other equipment. The Public Health Service, of the Treasury Department, investigates industrial diseases and factory sanitation. The Bureau of Labor Statistics, of the Department of Labor, investigates and publishes bulletins on accidents and diseases in various industries. Lately a bill has passed the House providing for a safety bureau in the Department of Labor, with power to investigate any or all of the matters of safety now carried on either in that department or in any other department. The seamen's law recently enacted is in the hands of the Department of Commerce, assisted by the Department of Labor. The Department of Agriculture has a division on rural housing and social conditions.

This overlapping of jurisdiction in matters of industrial safety and sanitation has grown up without any plan, according to the accident of such officials as happened to be on the ground or to get a hearing in Congress; or on account of objection to placing authority in one department or another. And now, with the prospect of Federal legislation for compensation for accidents and occupational diseases, one or two more bureaus are likely to be created, with their most important object the prevention of accidents.

At the same time three great private associations have sprung up which are doing as much or more for safety than all the State and Federal Governments combined. The Conference Board of National Allied Safety Organizations, composed of representatives from the National Association of Manufacturers, the National Founders' Association, the National Metal Trades Association, and the National Electric Light Association, has begun the standardization of safety devices for millions of employees, regardless of any standards which State or Government officials may set up.

The National Council of Safety, composed of the safety experts of most of the large corporations of the country and of representatives of labor, has developed an extensive campaign of accident prevention. The Workmen's Compensation Service Bureau, supported by the liability-insurance companies, is doing expert work of the highest order in safety devices and processes for the assistance of such employers as are policy holders in those companies.

With these three national organizations representing the employing interests, with at least five, and the prospect of seven, bureaus representing the Federal Government, and with similar agencies more or less developed in the States, all of them working on the same problem of compensation for accidents and prevention of accidents, the time is ripening for some kind of correlation and uniformity. It can not be expected that Congress and the people will long be satisfied with this expensive and wasteful disorganization of the national energies that are directed to the great work of safety and compensation. Just as the States are moving toward centralization under industrial commissions, so the same problem must force the Federal Government toward not only centralization of its own work but correlation with the States and with private organizations.

It does not follow that all of the Federal bureaus dealing with safety and health should be bodily taken from their several departments and transferred to an industrial commission. There may be cases where their work on industrial safety and health is tied up with their other work. It is only necessary that the several departments should be required by law to discontinue any overlapping or conflict of jurisdiction, and that an industrial commission should have authority to bring them all together into a national council of industrial safety and health and require them to agree on a definite plan of dividing up the work and cooperating with each other and with private associations organized for similar work. Other comments will be found under paragraph 3.

ADVISORY REPRESENTATIVE COUNCIL.

2. An advisory representative council consisting of the Secretary of Commerce and the Secretary of Labor and of, say, 10 employers (including farmers) and 10 representatives of labor unions (including women). The representatives on the council to be selected from lists, not including lawyers, submitted by recognized employers' associations in the State or in the Nation, as the case may be, such, for example, as State associations of manufacturers, the National Metal Trades Association, the National Founders' Association, associations of coal operators, of railroad presidents, of brewers, of farmers'

organizations, etc. The representatives of employees to be selected from lists submitted by the American Federation of Labor, the railroad brotherhood, the Women's Trade Union League, and independent organizations. In all cases either the associations entitled to representation should be named in the law, or provision should be made whereby the governor or President, upon investigation, shall name organizations which are considered representative by organized employers and organized employees themselves and permit them to name their representatives. Similar provision in case an organization ceases to exist or to be representative. Any organization to be entitled to recall its representative on notice. The representative council to be appointed by the governor or the President before the appointment of the commission and the governor or the President to call it together and to consult with it regarding the names proposed to be nominated for commissioners. The Industrial Commission to invite also a limited number, say, 10, of individuals or representatives of organizations including persons especially interested in unorganized labor and representatives of such organizations as the International Association for Labor Legislation, the National Child Labor Committee, and the Consumers' League and individual employers and employees, as may be advisable for their assistance, to be members of the advisory council. The council to take no vote on any subject except procedure and to have no veto on any act of the Industrial Commission. Nominal compensation or no compensation to members, with necessary expenses. The representative council to effect its own organization and call meetings independent of the commission, to be provided with a secretary and needed clerical assistance, to hold meetings perhaps quarterly and on call, to keep and publish records of its proceedings. The Industrial Commission to be required to submit all proposed rules, regulations, and publications to the representative council, allowing sufficient time for examination and discussion, and to publish any protest or criticism filed by any member of the council, along with the commission's own publication.

This recommendation is an extension of a principle which is left optional in several State commission laws, but the mandatory feature has been partially adopted by law in New York. The recommendation creates a body similar to the Superior Councils of Labor in France, Belgium, and Italy, the Industrial Council in England, and many councils of private representative citizens who assist Government officials in Germany. In Wisconsin the appointment of a council is optional with the commission, but it has been appointed for several purposes, and this policy has been demonstrated to be the most effective of all that the commission has adopted. The omission by that commission to adopt it at times has been a source of severe and just criticism, and accounts for the granting of permits against which objections are rightly made. In New York the representative council is mandatory, but the selections are made by the governor, and are therefore liable to be political and nonrepresentative. For these reasons it is recommended that the council not only be mandatory, as in New York, but that no action of the commission, except in case of specified emergencies, shall be valid and no publication shall be issued unless previously submitted to the representative council. In this respect the advisory representative council

would have powers in excess of those of similar councils, except perhaps the Superior Council of Belgium.

Appointment by the governor, President, or Industrial Commission is required in order that members may receive necessary expenses. Lawyers are excluded because the council should be composed of persons with practical experience in industry.

The history of governmental commissions and departments has often been the appointment of men on the recommendation of politicians or special interests or the accident of personal acquaintance. An executive, in looking around for competent appointees, is often at a disadvantage because he can not get impartial and disinterested men to accept, or because he does not have impartial and competent advice in his selections. To the proposed Industrial Commissions is given the most serious problem before the American people. Almost everything turns on the kind of men appointed. They must be men not only competent but having the respect of the great opposing interests. Their position is that of a kind of mediator as well as of administrator. Such appointments should not be made in haste, nor in the secret of the executive's accidental advisors. They should be considered publicly, and especially by the opposing interests whose fortunes will be committed in great part to their hands. The governor or President can not, of course, be bound by the action of the council, but he can be required to get their advice on names proposed.

It is intended that the members of the commission itself should not be representative of either employers or employees, but that they should have the confidence of both sides. This is expected to follow from the requirement that the governor or President should consult the council before making his nominations of commissioners. In this way, what is known as "the public" would be represented in part by the commission, while capital and labor would be represented in the council.

By this method it can be expected that capable men may be attracted from their private occupations into public service as members of the commission. Usually the kind of men required for such positions dread the political and personal attacks that are connected with public office. But it would be difficult for an eminent man to resist the call to public office when he has the united invitation of the President, the employers, and the labor unions of the country.

The representative council has no veto power, but is intended merely as a cooperative body representing employers, employees, the public as it is represented by the Secretaries of Commerce and Labor, and individuals selected by the commission. Its duties are purely advisory. Its purpose is not only to give the governor or President and the commission the benefit of advice and to bring together for conference representative labor men and employees, but to guarantee as far as possible that all appointments (par. 3), all investigations and publications (par. 4), all rules and regulations (par. 5), and other acts of the commission, shall, before they are published or become valid, be under the continuous supervision of the recognized leaders of organized capital and organized labor, and public representatives.

No requirement is made for the appointment of advisory experts, such as lawyers, engineers, and physicians. These may be appointed

by the Industrial Commission as members of the third interest on the council, but it is found in practice that the services of consulting experts are secured without expense to the State if representative employers and employees have a part in the advisory council. This is attended to because the employer and employee representatives themselves have not the technical knowledge and can not give the time necessary to consider all details, but must consult experts in whom they have confidence. This they do, and are thereby prepared to discuss intelligently the acts of the commission. The council and the commission can, of course, call in such experts to their conferences at any time.

The employer and employee members of the advisory council should be strictly representative and responsible to the organizations represented. For this reason the organizations and not the Government should pay the salaries of the members. The result as shown in Wisconsin, where not even expenses are paid, is that the representatives are usually business agents of the unions and large employers selected by the employers' associations.

The council should organize with its own officers, independent of the commission, but should hold its conferences with members of the commission or with members of the staff. It should appoint expert advisory committees as needed for different subjects, such as safety, employment offices, etc. It should be provided with clerical and other help from the staff of the commission.

Since the powers of the council are only advisory it is not essential that it should vote on any questions except procedure. Hence it is not necessary to have equal representation of any interests or full attendance at all meetings. Each member should be furnished by mail with all proposals and proposed publications of the industrial commission.

For the reasons just cited it is not necessary that the commission itself should consist of more than three members. They are not expected in the larger States or in the Federal Government to attend to details of administration. Their duties will be mainly those of consultation and conferences with the council, supervision of the executive heads of divisions (par. 3), and public hearings.

This advisory council provides effective publicity for every act of the commission. The ordinary publicity required by law is that of a public hearing, and is limited to rules and regulations which are to have the effect of law. Such public hearings have become mere legal formalities, at which usually lawyers appear for each side and little or no opportunity is given for the two sides to get together on points where they can agree. The commission then retires and issues such rules and regulations as it may choose. These formal public hearings are not even required by law in some cases, but (par. 5) the recommendation provides that before the public hearing the employers and employees, with the commission and its staff, shall have considered and drafted the proposed rules so that when it comes to the public hearing they are present to explain and defend them. If objections are raised at the public hearing the proposed rules are referred back to the advisory council and the staff of the commission for reconsideration before being finally approved and issued as the legal act of the commission. If no public hearing is required by law, rules can not be issued except on advice of the representative council.

In this way an effective publicity is secured by a thorough consideration of the rules, because both those who are to be compelled by law to obey the rules and those in whose interest they are issued have assisted in drafting them.

Additional comments will be found under paragraph 3.

CIVIL SERVICE AND COMMENTS ON PRECEDING PARAGRAPHS.

3. The commission to appoint a secretary, bureau chiefs, or chiefs of divisions, and such other employees as may be necessary, all of them to be under civil-service rules. Provision to be made for the advisory representative council or a committee named by it, representing both employers and employees, to assist the civil service commission in conducting examinations, except for clerical positions, and making it mandatory on the civil service commission to appoint these representatives on its examining boards. Members of advisory council while serving on such boards to receive extra compensation. If there is no civil service commission in the State, then the advisory council shall cooperate with the industrial commission in the examinations. The commission afterwards to make its appointments from the eligible list of those who pass the examinations. A graded system of salaries and promotions to be adopted, by which the members of the staff may rise to the position of heads of bureaus or divisions, where they would receive salaries equivalent, if necessary, to those received by the commissioners. Any proposed removal of subordinates to be brought before the advisory council before action.

Many of the features of this section are adopted in the New York act, but the examination by employers and employees is not mandatory on the Civil Service Commission, and a few of the chief positions are exempt from civil-service rules. The Civil Service and Industrial Commissions of Wisconsin have practiced this method of examination and appointment for employment offices and for chiefs of divisions, although not required by law.

Objection sometimes is made to civil-service examinations as being impractical and theoretical. Indeed, civil-service examinations are likely to be impractical if conducted by experts. These objections can be avoided in the examinations for these positions by requiring that the Civil Service Commission, if there is one, shall cooperate with the representative council. The examinations would thus be conducted with the aid of men thoroughly acquainted with all the practical difficulties involved in the duties of the positions to be filled. By making use of oral or written, assembled or nonassembled, competitive or noncompetitive examinations, as best suited to the particular purposes, it should be possible to obtain all the advantages of the civil-service system with few of its disadvantages.

Furthermore, it is not enough that examinations for positions under the Industrial Commission should secure efficiency and permanency; it is even more important that they should secure impartiality. The Industrial Commission itself and its entire staff are looked upon as mediators in adjusting the administration of labor laws to the actual conditions of industry. It is essential that both sides should have confidence in the staff of the commission, and therefore that both sides should have a voice in its selection.

This provision for representatives of employers and employees on examining boards should not be left optional with Civil Service Commissions or the Industrial Commission, but should be mandatory. It has been found that several Civil Service Commissions object to this provision, because they wish to retain unqualified authority for conducting examinations and making up eligible lists. This is one of the features of bureaucracy which should not be permitted where such vital issues as the contest between capital and labor are at stake. The provision in the recommendation does not prevent Civil Service Commissions from appointing experts on their examining boards; it merely requires them also to appoint, in addition, the recognized representatives of the interests who have previously been nominated by the interests themselves.

At the present time secretaries and bureau chiefs in the Federal Government are exempt from civil-service rules, and are usually appointed by the President and confirmed by the Senate. This is a serious discouragement to competent subordinates, who are thereby prevented from rising by promotion to the higher positions in their bureaus, and who see less competent political appointees brought in over their heads as well as frequently changed.

These recommendations are intended to place the highest positions under the Industrial Commission on an equivalent with the commissioners themselves. It would be unfortunate and impracticable, except in smaller States, if the commissioners were required to give their entire time to the details of administration. This is the case where a commission must perform as many functions as are required in the large State and Federal Government commissions. This they would be compelled to do if their chiefs of divisions were frequently changed, as under the present system. The chiefs of divisions and bureaus, both under Federal and under State commissions, should be as competent as the commissioners to deal with employers and employees, and much more competent in dealing with subordinates. In foreign countries the office of factory inspector, as well as all other offices dealing with the relations of employers and employees, are considered as professions. In some of those countries the universities provide training courses and lectures on the subjects for which the officials are preparing, and these are required to be taken as a part of the civil-service rules. The appointee then serves as an apprentice in the department and by promotion may reach the highest position. As a result a high grade of inspector is obtained. Only when the officers and employees of the commissions have such opportunities as these for a life work, provided they are impartial as between employers and employees, can officials be interested in preparing themselves for the work, or academies like those at West Point and Annapolis be adopted for the training of civil servants.

The advisory representative council, proposed in paragraph 2, also protects the administration of labor laws from the just fear of government by a bureaucracy. There must be officials if labor laws are to be enforced. The courts can not be relied upon alone, because prosecution can be begun only by private individuals. Consequently administrative officers and inspectors have been provided to initiate prosecutions. These officials constitute a necessary bureaucracy, if the laws are enforced. But it can not be asserted that the present

system of political appointments of inspectors avoids the evil of bureaucracy. The essential evil of bureaucracy is not so-called permanency of tenure, but the refusal of the official to take advice from laymen. The loudest agitator against bureaucracy becomes at once the most confirmed bureaucrat when he gets into office, because he determines to run his office in his own way, regardless of the advice of those who are compelled to obey his orders. In this sense the American officeholder is much more of a bureaucrat than are the European officials, who are compelled to consult the superior councils of labor or industrial councils of representatives of interests. It is for this reason that the legislatures and Congress should make it mandatory that the representative advisory councils should be created and that the industrial commissions and their staffs should confer with them before any act of the commission can have the validity of law. It is also necessary that the Civil Service Commission should appoint representatives from the council on its examining boards before any valid eligible list for appointment of subordinates can be made.

Another charge against civil-service rules is the objection to permanency of tenure and the inability to get rid of an official who adheres to outworn methods. This objection often has force, but the remedy is not that of returning to political and partisan appointments or frequent removals when changes occur in the political branch of Government. Officials, under most civil-service laws, can be removed at any time, provided reasons be given and no civil service commission should have authority to reinstate any official, as is the mistaken policy of some States. Permanency of tenure means only permanency on "good behavior." The principal reason why officials adhere to old methods is because there is no continuous supervising authority in a position to force them into new and better methods. The provision for an advisory council with which the officials are compelled to confer has been found to be the most effective method of compelling such officials to keep up with the changing conditions that require new methods. If, then, they are obstructive or incompetent to do this, there is good cause for removal.

COMMISSIONS AND CLASS CONFLICTS.

There are, of course, criticisms and objections raised against industrial and other commissions. It is not claimed here that they always work well. But they work better than the system they have displaced, and they have been found to be the only alternative where legislation attempts to regulate the relations of great conflicting and hostile interests. Many States and Congress have been forced by actual conditions to create railroad and interstate commerce commissions in order to take the details of the contest between railroads and shippers as far as possible out of the legislatures and the courts. Congress has been compelled, after 25 years of futile antitrust legislation, to turn over the contest between trusts and their competitors or customers, to a Federal trade commission. The contest between bankers and the commercial and business classes that depend on credit for their existence has been turned over to the Federal Reserve Board.

The contest between capital and labor is more serious than any of the other contests. Since the year 1877 it has frequently resulted practically in civil war, with the army or militia called in to suppress one side or the other, according to the will of the executive. It is claimed by some that this contest is irrepressible and will end in revolution, and at least it is plain, when the military power is called upon to decide a contest, that the ordinary machinery of government, which is fairly successful in other contests, has broken down.

It is not a solution of the contest to claim that these outbreaks are caused solely by agitators and have no foundation in conditions that need remedying. Such a solution, carried to its limit, means the suppression of free speech, free press, and free assembly, which can be accomplished only by military power. That there are conditions which need remedying is shown by the enormous amount of labor legislation of the past three decades, and the enormous amount of new legislation proposed. This legislation has come from the free discussion and investigation of actual labor conditions, and if there is no effective way for this discussion to be carried on and the alleged facts to be verified or disproved, then the result must be an excess of unfounded and impractical agitation mixed up with real grievances. There are unbridled agitators of this kind on both sides of the contest, and it is only when the two sides are brought together, and their charges, countercharges, and alleged grievances are boiled down by investigation to the residuum of facts, that mere unfounded agitation can be expected to give way to deliberations on remedies for recognized evils.

This does not mean that both sides can be made to agree on remedies for all evils and grievances, even after they have agreed on the facts. It means only that there is found to be a much larger field than was supposed where they can agree, and it is worth while for legislation to provide the means for bringing both sides together for a continuous search after the common points of agreement. When they have agreed upon and disposed of less disputatious points, they are in a position to go on to those disputed points which had been thought irreconcilable. This is the main reason for creating Industrial Commissions with adequate powers of impartial investigation, with conferences and discussions by both sides, and with power to decide on regulations and then to enforce them. (Par. 5.)

While some of the functions outlined for the proposed Industrial Commission are now being performed by the Department of Labor through its bureaus, it is not proposed that the department be abolished. (Par. 1.) It is even proposed that in large industrial States a similar department might be created in addition to the Industrial Commission. In nonindustrial States, where the labor department is mainly educational and not administrative, there would, of course, be no occasion for an Industrial Commission. Such occasion would usually first arise in case a workmen's compensation law were enacted.

We take it to be commonly accepted that a department, with its head having a seat in the Cabinet, is chiefly designed to advise and aid the administration in formulating its policy toward the interests in charge of that department, and to foster and promote the welfare

of those interests. To be sure, other responsibilities are intrusted to the department, but the foregoing are its prime duties.

That Congress intended it to be so is manifested in the statutes creating the different departments. Thus the law establishing the Department of Commerce declares that it should foster, promote, and develop the foreign and domestic commerce, the mining, manufacturing, shipping, and fishery industries, and the transportation facilities of the United States. Likewise in creating the Department of Labor in 1885, Congress stated its purpose to be the diffusion of "useful information on subjects connected with labor, in the most general and comprehensive sense of that word, and especially upon its relation to capital, the hours of labor, the earnings of laboring men and women, and the means of promoting their material, social, intellectual, and moral prosperity." Congress reiterated its position when it raised the Department of Labor to Cabinet rank in declaring that its purpose should be "to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions, and to advance their opportunities for profitable employment." It is also mandatory upon the Secretary "to make such special investigations and reports as he may be required to do by the President, or by Congress, or which he himself may deem necessary."

Congress has not only declared that it regards Cabinet officers or department heads as the personal choice of the President, whom they are to assist in formulating his executive policy, but it has also accepted it in practice. This is illustrated by the fact that the Senate, even when controlled by an opposition party, usually ratifies the President's nominations promptly and without objections.

When influential economic groups feel that the Government can be of assistance in promoting their interests, they set about to bring political pressure to bear upon Congress to create a department that will concern itself with their welfare. Thus the Department of Agriculture was created in 1889, largely through the efforts of the National Grange and other farmers' organizations. In the same way the Department of Commerce was created on the petition of the business and manufacturing interests.

Of course, the different departments have also been intrusted with administrative duties. The Department of Agriculture administers the meat-inspection service, the Department of Commerce the steamship-inspection service, the Department of Labor the immigration service, and so on. However, whenever an acute administrative problem arises, owing to an intense conflict between two opposing economic interests, and requiring a disinterested enforcement of law, it has usually not been intrusted to one of these political departments. Hence, when Congress turned its attention to the dispute between the railroads and the great majority of shippers, it did not create a Department of Commerce to administer the law, but instead intrusted it to the Interstate Commerce Commission, a disinterested and nonpolitical body. Again, when Congress determined upon legislation to deal with "the new economic problem involved in the increased tendency toward concentrated ownership of the large industries of the country," no one even thought of suggesting that this matter be turned over to the Department of Commerce. On the contrary, without a single objection, an independent administrative com-

mission, the Federal Trade Commission, was created to enforce the legislation. The same is true with the Federal Reserve Board. Congress has also applied this policy to the labor problem. The first important administrative act directly affecting capital and labor was not assigned to the Department of Labor for execution, but to a disinterested and nonpolitical board. We refer to the Newlands Act of 1913, and preceding acts relating to arbitration of labor disputes on railroads. When an effort was made to place the administration of this act under the Department of Labor, both the railroad companies and the railroad brotherhoods opposed and prevented the change.

We are of the opinion that if, in dealing with the labor problem, this policy is carried out consistently, considerable of the industrial unrest will be allayed. We believe that it should be the conscious policy of Congress to separate the policy-determining functions from the administrative functions. The Department of Labor should be intrusted with investigations that would aid the President and his administration in determining upon a labor policy. It should also be the educational medium through which the country is to be informed on the various labor issues that need solution or have not yet been legislated upon. As a matter of fact, this has been the department's chief and most effective activity. A glance at the list of publications of the department shows the influence it has had as a pioneer in labor legislation in this country. The present unanimity of opinion in favor of workmen's compensation, safety and sanitation, vocational training and employment bureaus, is largely due to its having concentrated upon educating the public to the need of such legislation. And the department wisely continues to fulfill its chief mission by pointing the way to future improvement of the conditions of labor. Its recent publications aim to enlighten and crystallize public opinion on such mooted but vital questions as sickness and unemployment insurance, old-age pensions, housing of workingmen, cooperation, employers' welfare work, home and factory conditions of women and children. To make its work still more effective the department has begun issuing a monthly review which will supply information on all questions affecting labor. We have no doubt that with the aid of the Department of Labor, legislation upon these subjects will be secured sooner than otherwise.

On the other hand, when public opinion, through legislation, has determined upon a policy, it is vital to its success that it be administered by disinterested persons not connected with a political department. This is necessary in order to obtain the mutual and voluntary cooperation of employers and employees, and, unless they are assured of a disinterested administration of the law, they will be reluctant to assist in its successful enforcement. Naturally a department which initiates and advocates new legislation is bound to antagonize those who are not in accord with its views. It is futile to expect the Department of Labor to get the good will and cooperation of those whom it successfully defeated in the legislative battle. We must remember that the department is constantly advocating new legislation, even while it is administering that which has been enacted. Thus the bitter feeling against it is bound to be permanently at high pitch, and those who differ from it would likely have no confidence in its being able to administer the law disinterestedly. Then, too, as we shall show, if a law is administered through a political department,

its efficient administration may be subordinated to political expediency.

It is in order to avoid these difficulties that we recommend the method already adopted in several States. We believe that an Industrial Commission, removed from the heat of political controversy, created with the safeguards proposed herein, would have the confidence of employers and employees. Although employers and employees may have hopelessly divergent opinions on policy, yet when the policy is once determined upon by Congress they are equally concerned in its efficient and disinterested administration. If assured of this, they cooperate in its successful enforcement.

Furthermore, much opposition to labor legislation, both by capital and labor, is based upon the fear that its administration will be partial. And even when such legislation is enacted, unless both sides have confidence in the disinterestedness of the administrators, it is doomed to remain a dead letter on the statute books.

In recommending that the policy-determining function be separated from the administrative function, we wish to separate, as much as possible, the problems upon which capital and labor disagree from those in which they have a common interest. Legislation is a matter of opinion. Men may honestly differ as to the wisdom of a certain law. Difference of opinion when strongly contested invariably engenders suspicion and distrust. Hence, if an Industrial Commission were called upon to initiate and advocate new legislation it would be forced to antagonize and lose the good will of either capital or labor, or of both. Such an outcome must inevitably hamper its administrative duties, which it can not carry out successfully unless it has the confidence of both sides.

But it is highly essential that the conditions of labor be constantly improved and adjusted to new industrial developments. This function of studying and promulgating the best policies for promoting the welfare of labor should be left to the Department of Labor, as originally intended when created. The future interest of our country demands that a department devote itself exclusively to the furtherance of the welfare of labor. New problems must constantly be studied, information furnished, and remedies suggested. Considering that in the final analysis public opinion, as expressed through legislation, determines the nature of the remedy, it is proper that a political department be intrusted with the duty of aiding in determining that policy. It is with this idea in mind that we make the distinction between the enactment of law which is political in its nature and must be fought out in the Congress and in the Cabinet and the administration law which is nonpolitical and should be administered by disinterested parties in cooperation with representatives of capital and labor.

The conclusion is that all subjects upon which Congress has not legislated so as to require an administrative department should be in the hands of the Department of Labor. Among these are the important subjects of sickness insurance, invalidity insurance, unemployment insurance, old-age pensions, occupational disease, child and woman labor, and so on. The department should make studies of comparative administration of labor law and the administration of laws in the States. Other subjects might be mentioned. In fact there should be no limitation on its field of investigation and the

education of the public to the evils which labor suffers and the remedies that should be adopted.

The Industrial Commission is purely an administrative body not intended to promote new legislation, except where it is needed in connection with its administration of existing laws. Other new legislation gets its initiative elsewhere. The proper place for opposing interests to make their fight on new laws is in the State legislatures and in Congress. Each side necessarily endeavors to elect its representatives, to employ its lobby, and to use every honorable method in its power to defeat the other side. The outcome is usually a compromise not wholly satisfactory to either. But it does not follow that the fight should be kept up in the administration of the laws that are enacted. Whatever they are, they should be enforced exactly as they stand, and neither side should control the executive and administrative officers. These should be impartial. It is because executive officials are mainly partisans that the administration of labor laws in this country has broken down. They may be appointed by political parties, but back of the politicians are the employers or the trade-unions that make secret or open deals with the politicians in order to control the offices. It can not be expected that employers will readily accept investigation or obey the orders of officials whom they know or suspect to be agents of unions or of politicians, intent on strengthening unionism or making political capital out of their positions. It is natural that employers should protect themselves either by getting their own agents into the positions or by getting a weak and inefficient trade-unionist appointed. In any case the laws are not enforced, and the laboring classes in turn become desperate and defiant of Government. An illustration is found in the recent industrial troubles in Colorado. Probably no State of its size in the Union has had upon its statute books more labor laws than Colorado, nor more trade-union representatives in office to enforce them, yet the nonenforcement of the labor laws was undoubtedly one of the contributing causes of the recent troubles. The history of many other States is similar, so far as nonenforcement is concerned. Labor representatives alternate with employer representatives or with labor politicians, who make a show of enforcing the laws while the masses of labor get no substantial benefit.

American experience has shown that this situation can be met only by a nonpartisan commission, removed as far as possible from politics. In other countries, and in British colonies having parliamentary forms of government, this kind of separate commission is not required, for the good reason that the Cabinet officer who enforces the labor laws is a member of Parliament, and Parliament must be dissolved and a new election ordered if the Cabinet loses control. Having a seat on the floor of the legislature he must answer questions put by the opposition. If one of his subordinates is inefficient or takes sides against employers or unions, some one in Parliament is liable to rise and demand explanations, and the Cabinet minister is compelled to explain and to stand by the subordinate or to repudiate him. The opposition may even be able to defeat the ministry and get a new election. Consequently, Cabinet officers are responsible to Parliament, and, although they are partisans and politicians, they are careful that their subordinates, who actually administer the laws, shall be impartial and efficient. In no other country, governed by a

parliament, would such important boards as the Interstate Commerce Commission, the Federal Trade Commission, the Federal Reserve Board, or the State railroad and public utility commissions, be taken out from under the jurisdiction of a responsible cabinet minister. In this country it is found necessary to make them wholly or partly independent, because there is no officer directly responsible to the legislature or the people who can be given control over them.

The same is true of the labor departments of parliamentary countries compared with such departments in the American State and Federal Governments. The issues in this country are too vital and menacing, they are too easily turned into political capital, and, at the same time, the politicians in charge are too little responsible to the legislatures, to Congress, and to the voters, for the American people to leave them in the hands of partisan or political officials. The plan of an industrial commission with a representative council as herein recommended, is based on American experience and fitted to American conditions in dealing with such issues of opposing interests.

But the commissions created to deal with the relations between other opposing interests can not be accepted as models for dealing with the opposing interests of capital and labor. The Interstate Commerce Commission was designed to reconcile the opposing interests of railroads and shippers, the Federal Trade Commission of monopolies and competitors, the Federal Reserve Board of bankers and borrowers, but in none of these cases were the opposing interests strongly organized for aggression and occasional paralysis of business verging on civil war. It was not so necessary then that the opposing sides should be strongly represented, as is recommended in the creation of the Advisory Representative Council. This council is a kind of parliament designed to hold the commission continuously to the impartial performance of its duties and the accuracy of investigations upon which the impartial performance of duties depends.

The Industrial Commission, as here proposed, adopts methods in the field of labor laws similar to those that collective bargaining between unions and employers adopts in drawing up voluntary joint agreements. Modern trade agreements are, in fact, almost complete codes of labor law for a particular industry, and, if voluntary collective bargaining could become universal and effective for all employers and employees, then the State or Government might not need to enact many labor laws. Something like this is actually attempted in those countries having compulsory arbitration. They provide easy methods for organizing and perpetuating unions of employers and unions of employees. They try to induce the representatives of these unions voluntarily to recognize each other, to get together to investigate grievances and demands, to confer and to draw up and enforce a joint agreement covering all alleged evils and grievances. If they can not succeed in doing this they provide a court of arbitration with substantially all the powers that the conferees of the unions and employers would have if they acted without compulsion.

But compulsory arbitration is too remote to be considered, or even anything which would logically lead to compulsory arbitration. In paragraph 14 we recommend voluntary collective bargaining with the Government acting only as mediator without any compulsory powers. Our alternative proposed for compulsory arbitration is in

part an industrial commission with a council of employers and employees.

The need of an industrial commission becomes more pressing in proportion as new laws are enacted and new executive duties are added. It was the introduction of workmen's compensation that forced attention to the situation. Here is a new type of legislation which is so evidently a matter in which employers are as much concerned as employees that it was not considered proper to intrust its administration to a department controlled solely in the interests of labor. Consequently separate commissions were created independent of the labor bureau, or else the compensation law was put in charge of the courts.

But the most important effect of the compensation laws is not the compensation to workmen, for no law pretends to pay the workman anything for his suffering nor even to pay him his total loss in wages. The most important effect is the universal pressure on employers to prevent accidents and to heal the injury as soon as possible.

Wherever this object of the law was understood either the work of factory inspection for accident prevention was taken from the labor bureau or the compensation commission and the labor bureau were consolidated. One reason for doing this is that employers have become as much interested in accident prevention as have workmen, for it becomes a matter of business and profits. Another reason is that the compensation commission itself may not be tempted to exalt the less important object of compensation over the more important one of accident prevention and speedy cure.

The employers now become just as much concerned as the employees in having an efficient factory inspection. They must do their own inspection, anyhow, for the sake of reducing the costs of compensation, and they do not need to be prosecuted as they did before. What they need in factory inspection is the help of inspectors who are expert in showing them how to prevent accidents and how to organize safety committees and to get the "safety habit" into their employees. Whatever reason may formerly have existed for trade-unions to get their members appointed as factory inspectors in order to drive home prosecutions no longer exists. Neither do employers any longer have reason for using political or underhanded methods in order to get weak and inefficient inspectors appointed. Employers now wish to cooperate with factory inspectors, and the only kind they can cooperate with are those who are impartial and efficient. The fact that employers have taken the lead in their three great safety organizations mentioned under paragraph 1, instead of being led by State and Federal labor officials, shows unmistakably the need of enlisting employers in at least this branch of labor law.

Another subject, unemployment, the most serious and distressing of all, is almost universally agreed as needing a comprehensive plan of employment offices. It is now generally admitted that it must be dealt with by the Federal Government. Both England and Germany have national systems of public employment offices. The English system is operated directly by the National Government; the German system is operated by the city and State governments correlated and supervised by the Federal Government. A combination of both methods will, perhaps, be necessary in this country. Bills have al-

ready been introduced in Congress, and the Department of Labor has begun the establishment of offices. But, in the contest between employers and trade-unions, the control of employment offices is essential to either side. The antiunion employers' associations already have sufficient employment offices, and many local trade-unions have employment agencies of their own.

Employers control the jobs. They hire whom they please. Surely they can not be expected to hire workmen sent to them by trade-unionists or politicians who happen to run the public employment offices. This accounts for the inefficiency of the offices in almost every place where they have been tried. They sink to the level of charity, finding occasional short jobs for casuals, but do not become the great labor exchanges which they should be as the first step in dealing with the most serious of all problems, unemployment. Experience shows that employers must have confidence in the ability and impartiality of the officials who run the employment offices or they will not patronize them. On the other hand, trade-unionists must have confidence that the offices will not be used to furnish strike breakers. The only effective solution of this predicament is the management of these offices by joint committees of organized employers and organized employees and their joint civil-service examination of the officials who run the offices. Under the Industrial Commission plan there are not only representative councils at the national headquarters, but similar councils for each State and for each local office.

Furthermore, no Federal legislation is more urgent than the supervision of private commercial offices doing an interstate business. If this country expects to promote public offices and to regulate private offices, the only effective way is through joint control by the acknowledged representatives of organized employers and employees, cooperating with a Federal commission that is impartial and non-political.

The subject of industrial education is vital to the Nation as a whole and immediately critical for both employers and employees. Yet, when a bill is introduced in Congress for national aid to industrial education, the administration is not placed under the Department of Labor, where it would naturally belong and where more has been done than in all other departments in the investigation of the subject. It is proposed to place the administration under an ex officio board of cabinet officers with an officer of the Bureau of Education acting as executive. Furthermore, no standards of efficiency are imposed upon the States as a condition of receiving the funds appropriated out of the Federal Treasury. (Par. 17.) This bill combines the features of political control, "pork-barrel" finance, and exclusion of the two great interests of employers and employees who are most directly concerned. The reasons for such recommendations are the popular demand for industrial education, and the lack of any effective method of bringing together the representatives of employers (including farmers) and employees. Such representatives are the ones who know the needs of industry and agriculture and are competent, with the aid of qualified educators, provided neither side dominates the other, to set up the standards of efficient industrial training which should be made the essential condition of receiving Federal aid. For this purpose the Industrial Commission should

add to its advisory council representatives of organizations of educators, such as the National Education Association, and the National Society for Promotion of Industrial Education. The Federal Industrial Commission, upon the advice of such a council, including employers, employees, farmers, and educators, could then determine the standards as a basis for receiving subsidies, which should probably require the States to provide governing boards of employers, employees, farmers, and educators, continuation day schools with compulsory attendance on the employer's time, adequate training of teachers with practical industrial experience, and so on.

In making the preceding three recommendations no reflection is intended on any particular State or Federal official now charged with the administration of labor laws. It is conceded that many of them may be doing the best work possible under existing laws. But it is recognized that the conditions under which they work make it impossible either to administer existing laws effectively or to assume the administration of additional laws urgently required to meet the increasingly difficult and complex problems of capital and labor.

Instead of interfering with the commendable work of trade-unions the recommendations are intended to strengthen unionism at its weakest point. One of the most serious obstacles in the way of a harmonious labor movement is the struggle of ambitious unionists to get the indorsement and control of their unions for political positions. The conflicts within unions for such indorsement and support are notorious in weakening the unions. Furthermore, in order to get and hold a political position the unionist must make alliance or connivance with and concessions to the leaders of political parties, and therefore is not free to support consistently the demands of labor. He must also often support or even appoint other politicians whose influence is used against the unions. This unquestionably weakens or destroys the confidence of laborers generally in the integrity and faithfulness of all their leaders who accept political positions, or are suspected of trying to get such positions. It is only when the union representative is paid from his union treasury instead of the public treasury, and is recalled by his union, that he is truly representative and the union itself has a sound basis for permanency and growth.

Our recommendations adopt this principle and counteract this weakness of unionism by making their representatives on the advisory council dependent solely on the unions. They receive no salaries from the public treasury, and can be recalled at any time when they cease to be representative. The result is that the unions usually nominate for such positions their regular officers or business agents who receive salaries from the union treasury for other purposes. Under such circumstances there can ordinarily be no question of the union representatives "selling out" to employers or politicians.

INVESTIGATIONS.

4. The Industrial Commissions to make and publish investigations and recommendations on all subjects whose administration is intrusted to them. Investigations and recommendations on other subjects to be made only on the request of the legislature, Congress, or the court. (Pars. 12, 13.) Since it is provided (par. 14) that the

Federal and State commissions shall cooperate in the mediation of labor disputes, the Federal commission should be the agency to which the States should look for continuous investigations and publications for the entire country of wages, hours of labor, cost of living, joint trade agreements, and all subjects involved in labor disputes, but the names of establishments or individuals should be kept confidential. It should publish, at least annually, a report on all strikes, lockouts, boycotts, blacklists, that have terminated during the year, but should not make such investigations during an industrial dispute unless consented to by both parties in the manner elsewhere provided. (Par. 14.) In making such reports it should give all material facts, including demands, negotiations, picketing, strike-breakers, conciliation, the acts of State or Federal authorities, as well as joint agreements reached with or without cessation of business. In preparing these reports the commission should not call upon any mediator, but should, if necessary, use its powers of compulsory testimony.

In order to assist State minimum-wage commissions in the most difficult part of their work the Federal commission should also investigate and report upon interstate competition and the effect of minimum-wage laws. Such investigations are of assistance also in determining other questions. State commissions should make reports on safety, compensation for accidents, minimum-wage investigations, employment offices, child labor, etc.

No-publication of any investigations to be made or any rules (par. 5) to be issued without previously submitting them to all members of the representative advisory council, with opportunity for criticism, the latter to be published by the commission with its own report. All forms, schedules, and instructions for investigators likewise to be submitted to the advisory council.

These recommendations regarding investigations are the most important of all the recommendations regarding the Industrial Commission. All of the other recommendations culminate in the validity of its investigations. Investigations furnish the basis for drafting laws by the legislature, for formulating rules and regulations by the commission (par. 5), for interpretation of laws and rules by the courts, and for prosecutions in enforcing the laws. The recommendations for an industrial commission, for an advisory council, for civil-service appointments, for subsidies (par. 17), and for court procedure (par. 7) are all directed toward securing reliability and confidence in the investigations and conclusions of the commission.

It is required that all investigations and proposed publications shall be submitted to the representative council before they are issued and time enough given for consideration and criticism. If, then, any rules are issued (par. 5) or investigations published without the approval of either side, their validity and accuracy are at once condemned and the commission is discredited. Under a partisan or political department of labor, it is unlikely that statistics and investigations are accepted, either by the public or by both employers and employees, at their face value. Nothing more serious can exist, in a country which depends so much on public opinion, than this distrust of official publications and statistics which purport to give all the facts upon which public opinion forms its conclusions. Employers,

employees, and the general public should be able to rely implicitly for their conclusions on official statistics on wages, hours of labor, health, safety, cost of living, unemployment, costs of production, distribution of wealth, strikes, boycotts, and all other material facts bearing on the relations of capital and labor. All labor legislation, all administration of labor laws, all efforts at mediation and arbitration, all recommendations of public bodies, go back for their justification to statistics and investigations. The money of the Government is worse than wasted, and the officials are discredited if there remains any interested body of citizens who do not place confidence in these official statistics and investigations. The temptation is so great, in view of the struggle between capital and labor, to distort or suppress or obliterate facts that no precautions too great can be taken to secure thorough criticism, verification, and filling in of omissions before the facts are published. No matter whatever else may be recommended, no recommendation can be depended upon that does not provide fully for the integrity, reliability, and complete inclusion of all material facts in every publication of official statistics and investigations. There is no certain method of doing this except in the recommendation that all alleged facts of statistics and investigations be submitted to the parties directly interested and affected by the conclusions. The proposed advisory council, composed of acknowledged representatives of these parties, acting independently, without intimidation or connivance, and watchful against any advantage attempted by the opposing yet cooperating interest, consulting their constituents on any matter, can be trusted to see to it that no material facts or conclusions are published without conclusive proof and none suppressed without disproof. If any member of the council objects to any final statement or conclusion, he is entitled within limits to have his protest published along with the report of the commission. In fact, the entire spirit of these recommendations is the utilization by Government of the organizations that have both common and hostile interests, in order to protect the Government itself against partisanship and partiality in dealing with the serious conflict between those interests. It is because the reports, findings, and recommendations of the present commission were not submitted to parties affected thereby or to an advisory committee similar to the one proposed for a permanent commission that we can not accept them as verified or criticized, so that we could have before us when finally acting upon them any criticisms or assurance that their statements were accurate or that important omissions had not been made. An advisory committee to this commission, similar to the one proposed, was approved for a short time and, after making changes in the proposals of the staff having the measures in charge, made certain unanimous recommendations as bills to this commission, but the committee was discontinued before it could complete its work. No staff of investigators, however careful, can be expected to have such complete knowledge of their subject as to be trusted without the scrutiny and criticism of the interests or persons affected by their reports. Whenever a permanent industrial commission is created there can be no provision more essential than that of providing the representative machinery for reliable investigations, findings, and publicity.

An illustration of the method of supervision of investigation here advocated is afforded by the Interstate Commerce Commission. The statistics of wages and hours collected by that commission are of importance in matters of mediation. They were so collected and arranged that they could not be relied upon for that purpose. Consequently a conference was called, consisting of the railway accountants, the railroad brotherhoods and other labor organizations, the statisticians of the commission and of the Department of Labor, to consider the statistics. After the discussion, which failed in some respects to reach agreement, the Interstate Commerce Commission issued new rules changing several features of the statistics in order to avoid the criticisms advanced, the changes to go into effect in 1915. It is this method of statistical investigation that is recommended to be made mandatory on Industrial Commissions.

The Industrial Commissions herein recommended are modeled in part upon the example of the railroad and public utilities commissions, the Interstate Commerce Commission, the Federal Trade Commission, and the Federal Reserve Board. Their powers are partly legislative, partly judicial, and partly executive. That which is most important is their power of making investigations of facts and conditions and then issuing orders (par. 5) based on such investigations. The legislature or Congress lays down a general policy or standard, but does not go into all of the minor details and variations that are needed to fit the policy to actual conditions. In the case of railroads it gives up the attempt to enact a schedule of freight and passenger rates and merely requires of railroad corporations that all rates and services shall be reasonable, that there shall be no discriminations, and so on. The commission then investigates each case as it comes up and issues a detailed order intended to carry out the policy and enforce the standard laid down by the legislature or Congress. In the case of labor law the legislative standards differ according to the object of the law. In matters of safety the legislature requires employers to keep their work places safe, and leaves to the commission the investigation of conditions and of safety devices necessary to be installed in each industry or shop, with power to order them installed. In compensation for accidents the legislature requires the employer to pay 50 per cent or more of the wages lost for a certain time, and then gives the commission power to investigate each case if necessary, and to determine exactly the amount and all details, and to order the employer to pay that amount. Other standards may be set up by the legislature, if it wishes to do so, for hours of labor, minimum wages, exclusion of women and children from dangerous employment, regulation of private employment offices, and so on, covering the entire field of labor legislation.

It is evident that the legislature can not itself make all of these investigations. It must depend upon others. In practice, too, the legislature and Congress are not willing to delegate to a single executive official the power of issuing rules and orders. This power is quasi judicial. Consequently the legislature and Congress create commissions with three or more members, in order to require deliberation and a fair representation and hearing for all interests that are benefited by or compelled to obey the rules. A single executive

official is liable to be one-sided and partisan, or to act without deliberation, or to be frequently changed, but a commission can be organized so as to be impartial, deliberative, and continuous.

In the administration of all other labor laws, such as those on industrial education, child labor, hours of labor, minimum wage, and so on, there are points of antagonism and points of harmony between capital and labor. The points of antagonism are enlarged and exaggerated when one side or the other, through practical politicians, controls the offices. The points of harmony can only be discovered by investigation, and the investigations must be cooperative between employers and unions, else neither side will have confidence in the results. The Industrial Commission and its subordinate officials, of course, have to be depended on to make the actual investigations, but the provision in the foregoing recommendation, that all matters and all proposed publications shall be submitted to the advisory council, representing the opposing interests, for their advice and criticism but not their veto, goes as far as practicable toward securing that the investigations, conclusions, and rules of the commission and its subordinates will have the confidence of both sides.

The particular recommendation regarding investigations of labor disputes is associated with a later recommendation regarding mediation. (Par. 14.) While recommending voluntary mediation, it is recognized that strikes and lockouts are of such public importance that the public is entitled to accurate information regarding their causes and continuance. In connection with its other investigations the investigation of strikes and lockouts shows underlying causes of industrial unrest and the failure of legislation or administration to remedy them. Official investigations and reports on those subjects have not as a rule been accepted, because they have been colorless for fear of giving offense, or because they are conducted under the direction of partisans of one side or the other. It is expected that investigations conducted under the supervision of the advisory council will avoid the defects of many official investigations.

All investigations of a general character, such as those on safety devices, wages, hours, conditions of labor, and interstate competition, should be made by the Federal commission, relieving the State commissions or bureaus for their work of local investigations, administration, and inspection, the Federal commission to be the central standardizing agency, leaving the State free to adopt or reject the standards. (Par. 17.) The investigation of interstate competition and the effect of minimum wage laws will be of use in the most difficult part of the work of State minimum wage commissions, which we indorse in so far as women and children are concerned.

RULES AND REGULATIONS.

5. The commission to make rules and regulations for carrying into effect the provisions of the labor laws which it enforces. This may be done by providing, in the industrial commission law or otherwise, for certain brief standards as may be determined by the legislature, for example, that all places of employment shall be safe and sanitary, as the nature of the industry will reasonably permit, that no person shall be allowed to work for such hours of labor or at such times as

are dangerous to his or her life, health, safety, or welfare, that employment offices shall give correct information, shall not split fees, and so on. Or, less preferably, the existing labor laws may be retained or new ones enacted in minute detail, and the Industrial Commission may be given power merely to make such additional rules and regulations or variations from the laws as are necessary to give them full effect. Rules to be submitted to the advisory council before issuing.

The method of brief legislative standards above mentioned is adopted by most of the States having Industrial Commissions and it is here recommended, but the latter is the method adopted in New York. The original policy of American labor legislation involved an attempt to cover in detail every contingency which might arise. This method has proved itself impractical. It is impossible for a legislature charged with so many other duties and having but little time for attention to any of them, to intelligently provide in detail for such matters as the safeguarding of machinery or the regulation of hours of labor and periods of rest in hundreds of different employments and under hundreds of different circumstances. Legislation upon these subjects has to-day reached the stage long ago reached by legislation relating to public health and public utilities. The legislature can provide only the general standards and must leave to administrative officers the duty of "filling in details."

Whether the labor laws of a State consist only of a few sections, as in Wisconsin, or are a bulky law, as in New York, there still exists the necessity for the further filling in of details, and if the labor laws enacted by the legislature are at all lengthy, as in New York, there exists the additional necessity of some means for variations in deserving cases, either by express provision of the law or, in the absence thereof, by the tacit overlooking of violations by the officials charged with the administration. This latter practice is an opportunity for graft or favoritism. A factory inspector goes into an establishment and has the power to order changes amounting to several thousand dollars. He finds many points where the strict letter of the law does not apply. Since he is the only person who actually interprets the law on the ground he can readily overlook violations. But where the laws do not go into details, but an Industrial Commission determines the details in the form of rules fitted to conditions, the inspector no longer has discretion in overlooking violations. He must report all the violations, and the employer has another remedy besides influencing the inspector. He can go to the commission with a petition that a different rule be made to apply to his case, and the commission, after a public hearing, may grant or reject the petition, or modify its rule for that particular establishment. Variations must be made in any case. The difference is, that where there is no commission with power to make rules, the variations are made in secret by the different inspectors, while where the commission has this power they are made in public. (Par. 6.)

In the recommendations above, the briefest kind of a legislative standard is indicated. Whatever its length, however, the best method of filling in the details is the same. It is not unconstitutional to delegate such power to a single individual, but it is undesirable and, as already pointed out, impracticable to confer it upon one person. The

alternative is to confer it upon a board or commission. The chief question arising here is whether a board shall be created especially for this purpose or whether one board shall perform this duty together with that of administering the laws and the rules and regulations made by it. The latter is the Industrial Commission recommended. The other method has been tried in the two greatest industrial States in the Union, New York and Pennsylvania, but the former State abandoned it after a two-years' trial. In New York it was adopted two years ago when the factory investigating commission declined to take the administration of the labor department away from a single executive, but adopted a compromise through establishing an industrial board of four members, together with the labor commissioner as chairman, to perform the rule-making function whether in the form of general rules or variations. While the board has done much good work, there remains little doubt that the same work can be performed even more intelligently and effectively by a commission which is also actively engaged in administrative work. In both cases, the aid of committees representing particular industries or interests has been and must be largely relied upon. On the other hand, an industrial board such as formerly existed in New York, and still exists in Pennsylvania, the rule-making duties of which are solely legislative in their nature, without power of enforcement, is not much better equipped to make such rules and regulations than the legislature, except that its number is smaller and its personnel chosen particularly for this one duty.

The recommendations provide different methods of securing uniformity of State and Federal legislation on various subjects (pars. 17, 18). This uniformity has been secured in the case of railroads by exactly the same method as the one here proposed to be made mandatory. When Congress enacted a law requiring safety couplings there were a large number of manufacturers of couplings in the market. Congress gave authority to the Interstate Commerce Commission to decide on the kind of couplings that would accomplish the object of securing safety. The commission called in the representatives of the railroads and of the railroad brotherhoods, with the manufacturers of couplings, and after several conferences the present standards were adopted. Other standards applying to railroad cars were also adopted in this way.

At the present time there is urgent need for Federal aid in securing uniformity of safety devices. This can be done to a certain extent through voluntary cooperation with the States. Various States with industrial commissions are going ahead with their own standards, and there is apparently no means of securing uniformity until a Federal commission is given power to act. This could be done if the Federal commission brought together representatives of State factory inspectors, along with its advisory council of employers and employees, and the private national safety organizations mentioned under paragraph 2. By agreeing on standards, these could be adopted by every State commission which has power to make rules. And the Federal commission would be merely a central standardizing agency, leaving to the States the voluntary adoption of the standards. If it were desired to go further, a Federal law granting to the Federal Industrial Commission power to set standards for interstate

shipment of machinery not equipped with the standard safety devices might be adopted. Each method would require a Federal commission to set standards.

The illustration regarding safety is taken not because that is the most important problem, but as furnishing an illustration of possible methods applicable in other lines. Similar uniformity might be secured in the regulation of private employment offices and other lines of labor legislation, as the States or Congress may determine. Of course, if the Congress enacted legislation similar to the Palmer-Owen child-labor bill, the extreme step would be taken of attempting to force States to come up to Federal standards. This may be necessary in some cases, but the Federal Industrial Commission affords methods of securing uniformity in some branches of legislation by less extreme measures.

The courts have generally denied the contention that this delegation of power to make rules and issue orders is unconstitutional as a delegation of legislative or judicial power, and the Supreme Court of the United States has used the term "administrative" to describe those powers which are partly legislative or judicial, but are not so exclusively one or the other that they may not be properly conferred upon an executive or administrative body. (See *Interstate Commerce Commission v. Humboldt S. S. Co.*, 224 U. S., 474; *Pennsylvania Railway Co. v. International Coal Mining Co.*, 230 U. S., 184; *Mitchell Coal & Coke Co. v. Pennsylvania Railway Co.*, 230 U. S., 274.)

REVIEW BY COMMISSION.

6. Any person in interest to be entitled to petition the commission for a hearing on the legality or reasonableness of any rule or regulation or of any order directing compliance with any provisions of law or other rule or regulation or for a special order applicable to a single establishment. The commission may change its rule or regulation before final decision by a court on its legality.

This recommendation is embodied in one form or another in all of the State commission laws. Under the prevailing system of administering labor laws a person affected by an order enforcing an act of the legislature has no opportunity to object to its constitutionality, reasonableness, or validity except by awaiting prosecution and submitting his objection as a matter of defense. Not only is this cumbersome and undesirable as a matter of procedure, but it is open to a very serious objection that it brings this matter up often for final decision by a petty court, or even before a local magistrate or justice of the peace.

Not only does a provision of the sort here recommended give the person affected opportunity to make proper objections, but it gives the commission an opportunity to reconsider its rules and orders from the point of view of their actual application in concrete cases before they are subjected to tests in the courts. Questions arising in the application of rules and orders to concrete cases frequently depend upon facts and conditions which are difficult to bring out accurately and thoroughly in the courts. The proceedings before the commission will develop the facts and conditions which are alleged to justify the provision and those which the employer depends upon

to defeat it better than could be done in any court. It is frequently necessary for the court to have such facts available in order to arrive at a proper decision upon the constitutionality of such a rule or order, and in the absence of such a proceeding as this, an appellate court has practically no means of obtaining such information. This could not be better illustrated than in the recent decision of the New York Court of Appeals (*People v. Schweinler Press*, 214 N. Y., 395), upholding the constitutionality of the section of the labor law prohibiting night work for women, and, in effect, overruling its own decision of eight years previous, holding a similar provision unconstitutional. In the opinion of the recent case the court frankly says that its previous decision was due to a lack of proof at that time that the prohibition bore some direct relation to the public health and welfare, and that subsequently such proof had been gathered and was of such a nature as to warrant a different decision. In this case the evidence had been gathered largely through the efforts of a special factory investigating commission, but the whole incident illustrates the necessity for a thorough consideration of all facts involved before the matter is taken into the courts, and making the results of such consideration available for the use of the courts.

The special order applicable to a single establishment is necessary in order to take into account peculiar conditions, which, if rigidly applied, might render the entire law or general rule unconstitutional.

COURT REVIEW.

7. Any person in interest to be entitled to bring a special action in court to test the legality and reasonableness of any provision of the labor laws, of any rules and regulations made thereunder, or of any order directing compliance therewith. (It is probably advisable, in the case of State commissions, to limit the jurisdiction of such cases to a court sitting at the State capitol.) Actions involving rules and regulations and orders not to be brought until final determination of the petitions for review (par. 6) by the commission. Provision also to be made for suspending prosecutions pending determination of petitions or actions for review in court. Matters of fact which had not been before the commission to be referred back to the commission and opportunity given for the commission to change its rules or regulations before final decision by the court. Rules and regulations of the commission to be made *prima facie* reasonable in all court proceedings.

This recommendation is provided for in different ways in the different State commission laws. The purpose of these provisions, together with those relating to review by the commission (par. 6), is to secure a uniform interpretation of the labor laws and the rules and regulations for carrying them into effect; to prevent their being held unconstitutional by petty courts (which often results, on account of the impossibility of appealing such a decision, in an absolute bar to further enforcement of such provisions in that locality, even though the provisions may eventually be upheld by a higher court); and to protect the commission from ill-considered action by higher courts not having before them sufficient information to enable them to arrive at an intelligent decision.

TESTIMONY.

8. The commission to have the incidental powers such as those of subpoenaing and examining witnesses and administering oaths, and so on, necessary for the full performance of duties imposed upon it. These powers, however, to be strictly limited to those branches in which the commission, on the basis of experience or the constitutional rules regarding evidence, finds them indispensable. In all other work the commission to have no powers of compulsory examination, and so on.

The powers of compulsory investigation and public hearings are liable to serious abuse in order to gain some temporary publicity or personal advantage, but in practice it is found that competent investigators and informal conferences, such as those of the proposed advisory councils, can secure more valuable and reliable information than when individuals are placed on the stand and required to talk to the stenographer.

CONTINUOUS INDUSTRY, EMPLOYMENT, AND INSURANCE.

9. In all industries or occupations operating continuously day and night and seven days a week the legislatures or Congress should enact laws requiring three shifts of eight hours each and one day of rest in seven, or their equivalent, administered under rules of an industrial commission laid down for each industry or establishment as may be required.

This class of legislation has been widely adopted in European countries, but has been found unenforceable without the aid of an administrative body competent to take into account the many differences of different establishments. In those countries hundreds of different rules are issued for different industries. For example, the rules for Pullman employees would differ materially from those for steel mills or hotels. We consider such laws unenforceable without this provision, and their enforcement can not be secured without a commission under the supervision of a representative council such as we recommend.

The Industrial Commission, with its advisory council, in its administration of employment bureaus is evidently the body to work out improvements not only in the bureaus themselves but in measures designed to provide for the unemployed or to regularize employment, such as workmen's hotels, or advice to Federal, State, and municipal authorities for shifting their work to the winter months or to periods of depression. These matters have been remarkably provided for in Germany, where the employment bureaus, with their advisory councils, have become the most effective of those in any country.

Such measures as sickness insurance, invalidity insurance, and unemployment insurance evidently require a large amount of investigation before they can be recommended. Their principal object should be the cooperation of employers and employees in the prevention of sickness, invalidity, and unemployment. Their administration and the drafting of laws and rules will evidently have to be entrusted to a commission with such an advisory council as is proposed.

POLICE AND MILITARY.

10. That such detective agencies may operate in more than one State, or be employed by industrial corporations engaged in interstate commerce, or which may use the mails shall be compelled to take out a Federal license, under the Industrial Commission, with regulations that will insure the character of their employees and the limitation of their activities to the bona fide business of detecting crime. Similar license and regulation for all private employment offices engaged in interstate business.

That all enterprises shall be forbidden the right to employ private armed guards, except as watchmen on the premises, or to have such watchmen deputized as police except where such is found necessary by the State or Federal Industrial Commission. That rules adapted to the differences required by various industries should be made by the Industrial Commission, in order to carry these laws into effect.

That such enterprises shall exercise their right to call upon the constituted authorities to furnish them with the necessary protection to their property, and to the lives of their workers, against the threatened attack of rioters or strikers; and that it shall be incumbent upon the constituted authorities to furnish such protection in the way of police or deputy sheriffs, and that a failure on their part to do this shall lay the political subdivision in which such damage to life or property may take place liable to damages. That all individuals denied their constitutional rights of habeas corpus, free access to public highways, free speech, etc., shall have similar power of action in damages against the political division in which such denial takes place. That all highways now claimed as private property shall be made public.

That the militia of the several States being subject to regulation by Congress, carefully drawn rules for their personal organization and conduct in the field shall be drawn up by the War Department, after conference with the Industrial Commission and advisory council, and that all parties arrested by the militia during the time of troubles shall be turned over for trial to the civil authorities. Similar rules should be drawn up by State authorities, with the cooperation of the State industrial commission and its advisory council, for the regulation of State constabulary. The War Department, with the aid of the Industrial Commission and advisory council, should investigate and recommend legislation regarding the shipment of arms and guards in interstate commerce.

One of the principal reasons why corporations are compelled to employ private guards is the failure of the taxpayers to provide them. This is also one of the principal reasons why laborers and labor organizers are denied their constitutional rights. Taxpayers take little part in the elections or otherwise to provide officials competent to and willing to protect the rights both of capital and labor, because the invasion of these rights does not affect them. This would be changed if the political subdivision were made liable in damages. Yet it is not proper, as has been done in some States, to provide for protection of property in this way without providing also for protection of labor in the same way. Laws designed to regulate deputy sheriffs or the police force can not be made effective under our system of local government without liability of taxpayers for violation.

The drafting of rules for the conduct of militia or State constabulary should not be left entirely to military authorities but should be drafted with the joint discussion and advice of employers and employees, who are more directly affected than other classes in the community. It is not intended that the Industrial Commission or advisory council shall have a veto on any regulations issued by the military or police authorities, but they should have opportunity for criticism and advice. The entire subject of policing industry has not been sufficiently investigated from all points of view, and more specific recommendations than these can not now be indorsed. It is therefore recommended above that further investigations from all points of view should be referred to the proper Federal and State authorities, assisted by the representatives of all interests affected.

LEGAL AID.

11. State commissions (and perhaps the Federal Commission) should render aid and assistance to deserving workmen in the adjustment of disputes other than collective disputes, and the recovery of claims arising out of their relations with their employers, and generally take such action as may be necessary for the protection of employees from fraud, extortion, exploitation, and other improper practices. For this purpose the commission to be authorized to assign members of its staff to appear in justice and other courts which adjudicate such claims, and to create local advisory committees of employers and employees to pass upon all such claims in cooperation with the deputy of the commission and in advance of court procedure.

This recommendation has been partly adopted in the New York act. An examination of the reports of existing public agencies of this sort and of the legal aid societies of the large cities of this country shows that by far the largest single class of cases with which they are called upon to deal is the adjustment of small wage claims. In some communities there already exist municipal and other so-called "poor men's courts" and "small debtors' courts," intended especially for the speedy settlement of small claims and disputes; but even the best of these courts are scarcely sufficient in themselves to meet the situation which confronts many employees. In some of them a very large proportion of disputes over small wage claims, in some instances as high as 90 per cent, can be settled if the two parties can only be brought together under conditions which make it certain that if a settlement is not made there is some one standing back of deserving claimants ready to push their cases.

Then, too, these cases frequently involve a general practice from which many individuals suffer, and yet it is impractical for any one of them to take the necessary action to secure redress or put an end to the practice. Members of a given class are often made the victims of exploitation or improper practices under conditions where it is not practical nor worth while for any individual to fight the matter out, and yet where the aggregate loss to the class is considerable. The ordinary shipper is generally able to pay for necessary legal services, and still Congress and a number of the State legislatures have required the Interstate Commerce Commission and the State commissions to render just such aid to shippers having claims against

railroads, because of the economic disadvantage in which an individual shipper is placed in a contest with the railroads. That employees stand in need of such protection from the State is evidenced by the mass of labor legislation which has been enacted and the agencies which have been created for its administration.

Nor does such provision lack precedents other than the railroad legislation already referred to. For some years the bureau of industry and immigration of the New York Labor Department has, in cooperation with the New York Legal Aid Society, extended just such assistance to immigrants, and almost the exact provision here recommended has been included in the industrial commission law just enacted in New York.

Kansas City maintains its own legal aid bureau as part of the city government, and of the five or six thousand cases a year handled by it, almost half are wage claims. The largest class of cases handled by the public defender of Los Angeles is wage claims.

The above recommendation is intended to establish in the United States a system analogous to the industrial courts of France, Germany, and other European countries. But it can not be expected that many localities will initiate this class of courts, and it will require a State commission to make them general. If municipalities were given authority and then actually established such courts, the State commission would withdraw.

LEGISLATION.

12. The Industrial Commission, upon request of the legislature or Congress, or the committee on relations between capital and labor, to investigate a subject and draft bills. The commission to make recommendations regarding legislation affecting subjects under its jurisdiction.

It is not proposed that the Industrial Commission shall initiate legislation or make recommendations, except on laws previously assigned to it for administration. Matters outside its jurisdiction would bring it into the political and controversial field. Yet when Congress or the legislature is considering new legislation, such as sickness insurance, unemployment insurance, and so on, it might refer the matter, in its own discretion, for further investigation and recommendation. Advanced legislation is fought out by lobbies and in committees, and the advantage of reference to the Industrial Commission would be the cooperation of its advisory council in drafting a workable law, eliminating "jokers," and carrying out the intent of the legislature. At present there is no definite means provided whereby lobbyists can be required to come together and confer regarding measures. They appear usually as antagonists or lawyers before legislative committees, and not as the conferees of an advisory representative council. This proposition is by no means a novel or untried one. After fruitless administration of the impractical coal-mining laws, which had been placed on the statute books mainly by the labor unions of Illinois and Colorado, the legislature turned the matter of revising the mining code over to a joint committee selected by the coal operators and the mine workers' union, and then enacted into law, without amendment, the code which the two

opposing interests, in conference with the legislative committee, jointly recommended. The advisory committee on apprenticeship of the Wisconsin commission has recently agreed upon an apprenticeship law satisfactory to employers, trade unions, and the commission, and this was adopted by the legislature without change. This method of legislation can be indefinitely extended to all matters, with the result that, while both sides protect their own interests, they often eventually reach agreement on points where their interests and those of the public are common.

This, of course, does not do away with the final authority of Congress or the legislature, nor with the battle of opposing interests in the legislative branch of government where they have not been able to agree, nor where other interests are affected. Here is the proper place for the lobbyists of both sides to endeavor to get the support of representatives of the people, and to override the other side. There could not be much of the advanced legislation required to meet the problems of capital and labor without a struggle in the legislature or Congress on new issues. But when the legislature is ready to take an advanced step, it is an advantage to require the combatants to confer on the details and to subject their differences to investigation by an impartial body on which they have representation. This advantage is intended in the above recommendation.

SUPREME COURTS.

13. At the request of the Supreme Court (State or Federal) the Industrial Commission shall investigate and report upon any questions of fact referred to it by the court and bearing upon the constitutionality or reasonableness of any Federal or State statute or administrative rule on the relations of employer and employee. Amendment of the judicature act so as to permit a State to appeal from its own supreme court to the Federal Supreme Court on a decision against a State based on conflict with the Federal Constitution.

While the principles of law are held to be settled and unchangeable, their applications change when conditions change. Decisions of the courts on the constitutionality of labor laws often turn on the information which is placed before the court as to the necessity of the law. The Supreme Court declared an eight-hour law for miners constitutional and a ten-hour law for bakers unconstitutional largely because it was furnished with conclusive information on conditions in the mines but not in the bakeries. (*Holden v. Hardy*, 1898, 169 U. S. 366; *Lochner v. New York*, 1907, 198 U. S. 45.) The court of New York in 1907 declared (*People v. Williams*, 189 N. Y. 131) a law prohibiting night work for women unconstitutional, but held a similar law constitutional in 1915 (*People v. Schweinler Press*, 214 N. Y. 395), and gave as the reason for its change of opinion the new evidence placed before it in the second case. The court said in 1915:

1. It is urged that whatever might be our original views concerning this statute, our decision in *People v. Williams* (1907) is an adjudication which ought to bind us to the conclusion that it is unconstitutional. While it may be that this argument is not without an apparent and superficial foundation and ought to be fairly met, I think that a full consideration of the *Williams* case and of the present one will show that they may be really and substantially differentiated, and that we should not be and are not committed by what was

said and decided in the former to the view that the legislature had no power to adopt the present statute. * * *

While theoretically we may have been able to take judicial notice of some of the facts and some of the legislation now called to our attention as sustaining the belief and opinion that night work in factories is widely and substantially injurious to the health of women, actually very few of these facts were called to our attention, and the argument to uphold the law on that ground was brief and inconsequential.

Especially and necessarily was there lacking evidence of the extent to which during the intervening years the opinion and belief have spread and strengthened that such night work is injurious to women; of the laws, as indicating such belief, since adopted by several of our own States and by large European countries, and the report made to the legislature by its own agency, the factory investigating commission, based on investigation of actual conditions and study of scientific and medical opinion that night work by women in factories is generally injurious and ought to be prohibited.

Other illustrations might be given showing the way in which courts respond to the needs of progressive legislation when once they have before them ascertained facts. Investigations by attorneys or interested parties may have a certain weight in court, but the weight can not be as great as the investigations and findings of an impartial commission, supervised by representatives of the interests affected by the decision. Criticism of the courts for decisions overturning laws designed to protect labor, and the demands for constitutional amendments depriving the court of power to declare laws unconstitutional, or providing for recall of decisions or recall of judges, often fail to reach the real difficulty. The difficulty is that bureaus or departments of labor and statistics have been so incompetently managed or their investigations so remote from the concrete facts that need to be established that the courts have had no reliable information and have been compelled to fall back on their own meager information or "common knowledge." If the court had at hand a reliable and well-equipped referee with power to get the facts, as in the Industrial Commission, it is probable that it would call upon such referee instead of basing its judgment on the doubtful claims and technical arguments of attorneys.

It will be noted, however, that this recommendation is merely supplementary to those in paragraphs 6 and 7. In those paragraphs the rules and regulations of the commission itself dealing with labor conditions are tested before the court, and they are made *prima facie* valid and reasonable as based on adequate investigation. The present recommendation is optional with the court and may pertain to an act of the legislature or the rule of an administrative body upon which the court is not reliably informed as to the facts.

A provision similar to this is included in the recent Federal Trade Commission act (sec. 7).

The recommendation for amendment by Congress of the judicature act is based on the fact that private individuals or corporations can now appeal to the Federal courts if the decision of the State court is against them, on the ground of conflict with the Federal Constitution, but the State itself can not appeal if its own State court has decided against the State on the ground that the State law conflicts with the Federal Constitution. It is sufficient that a State court should decide issues under the State Constitution, but the Federal Supreme Court alone should decide finally all issues under the Federal Constitution. With the provision that the Supreme Court

should require the Industrial Commission to investigate and report upon the facts which are alleged to justify the State legislation in question, the way is prepared for the Supreme Court to have before it the economic and social facts necessary to pass intelligently upon these questions of constitutionality.

MEDIATION AND MINIMUM WAGE.

14. The Industrial Commission (State or Federal) shall appoint, remove, and fix the compensation of a chief mediator of industrial disputes, the chief mediator to hold his position until removed by the Industrial Commission and to appoint such assistants as may be needed, and to fix their compensation with the approval of the Industrial Commission. He should appoint temporary mediators for special cases, without requiring them to give up their private business or offices.

The chief mediator and all assistant mediators to be selected from an eligible list prepared by the Civil Service Commission on a nonassembled examination, with the assistance of the Industrial Commission and the advisory council.

The chief mediator and his staff to have no powers whatever of compulsory testimony and to be prohibited from arbitrating any dispute, from making any public recommendation, or from revealing in any way, directly or indirectly, any information which they may have secured from any parties relative to an industrial dispute. Any violation to be sufficient ground for immediate removal by the Industrial Commission. The powers of the mediators to be those solely of voluntary mediation or conciliation, but the chief mediator shall offer his services in confidence to both sides of a dispute which, in his judgment, is of public importance.

The chief mediator and his staff to be wholly independent of the Industrial Commission, except as to appointment and removal, to the extent that they be prohibited from reporting any facts or recommendations whatever to the Industrial Commission or any other authority relative to the merits of any industrial dispute.

In case the mediator is unable to secure an agreement through conciliation, he shall recommend arbitration to both parties, and if both consent to abide by the decision of arbitrators he shall proceed to assist them in selecting a board of arbitration in any way and consisting of any number of members that both sides may agree upon. If agreement is not reached within a specified time on the third party to the board of mediation, the chief mediator shall appoint the same.

In case both parties do not consent to arbitration the mediator shall recommend the appointment of a board of mediation and investigation, which shall have power to make public its findings and recommendations, but such recommendations shall not be binding on any person. If both parties shall consent to such a board, the mediator shall assist them in creating the same and shall appoint the third member, if the parties can not agree on the same within a specified number of days.

In case both parties accept either a board of arbitration or a board of mediation and investigation, such board, as the case may be, shall

have power of compelling testimony. The Newlands Act and the Department of Labor act should be so amended that all mediation and conciliation, whether on railways or in other industries, shall be consolidated under the mediator of the Federal Industrial Commission. The Federal commission should cooperate with State mediators.

In the case of women and children, minimum wage boards should be created by the State industrial commissions.

The foregoing recommendation is intended to provide for strictly "voluntary" methods of mediation and arbitration. When engaged in this branch of its work the commission is not only prohibited from using its compulsory powers, but its mediation work is so rigidly separated from its other work that it can not even be suspected of using the coercive power of Government to favor either side. The mediator and his staff are to be strictly confidential advisors to the opposing interests, without the power of Government, or even the threat of using that power, to coerce either side of a collective dispute. If coercion is used in the form of "compulsory testimony" it is only with the previous voluntary consent of both sides.

The reasons for reaching this conclusion, and for recommending that in other branches of its work the proposed commission shall have the ordinary coercive powers of Government, are based on the fundamental distinction between collective bargaining and the individual labor contract. The principle in general is, that Government should not employ its coercive powers to regulate collective bargaining, but should, in certain matters, employ the force of law and administration to regulate the individual labor contract. It does the latter through laws on child labor, hours of labor, safety and health, workmen's compensation, sickness insurance, minimum wage, and so on.

Collective bargaining, in its last analysis, is based upon the coercive power of antagonistic classes organized for aggression and defense. The bargaining power of either side is the power to use the strike against the lockout, the boycott against the blacklist, the picket against the strikebreaker, the closed union shop against the closed nonunion shop, and so on. These are essential weapons, and no plausible verbiage or double meaning of words should blind us to the fact that these weapons are coercive, and are intended to be coercive, and, in the last analysis, will be used, secretly or openly, as coercive, by either side. Their object is similar to legislation regulating the individual labor contract except that they regulate it through joint agreement backed by their coercive weapons, instead of fines and imprisonment.

The question then is, Shall the coercive power of Government be used to deprive one side or the other, or both sides, of any or all of their coercive weapons designed to control the individual labor contract?

The most extreme use of this power is known as compulsory arbitration. Here the Government attempts to deprive both sides of all coercive weapons by completely prohibiting strikes, lockouts, boycotts, blacklists, picketing, and strikebreaking, and by preventing either side from using its methods of strategy designed to overcome the other side.

But the Government may use its coercive power to deprive either side of only a part of its weapons or strategies. Arbitration, or a joint agreement, consists of several steps, and at each step each side either employs its weapons or else resorts to strategy in order to play for position and to gain an advantage when it comes to using the weapons.

The first step in strategy of collective bargaining is recognition of the union; that is, recognition by the employer of the representatives of the union by consenting to confer with them. How important this preliminary step is considered by both sides is shown by the meaning which they give to the term "recognition." To "recognize a union" is considered to be not to merely hold a conference with its agents, but also to investigate grievances and demands, to negotiate concerning the terms of a collective agreement, and even to employ union men on terms consented to by the union. Strictly speaking, these are not "recognition," but are steps in collective bargaining that follow recognition. Recognition in the ordinary use of the term (the one here used) would be merely a conference in which the employer meets certain individuals, not as individuals but as recognized agents of the union authorized to speak on behalf of his employees. But it is so well understood that recognition, even in this limited sense, will be followed by other steps, that the decisive battle is often fought out at this point. The employer knows that, if he meets the leaders, the union has gained an advantage. He has acknowledged to all nonunionists and timid unionists in his shop that the union is something he can not ignore, and this is a flag of truce and a concession for his employees to join the union or come out openly on its side. By just so much he has weakened his bargaining power against the union. Consequently, if he has decided not to have a certain union in his shop he must refuse at the very beginning to confer with its agents.

If, then, the Government steps in and compels both sides to confer, it may take the first step in the name of "compulsory investigation" or "compulsory testimony," without power to prevent a strike or lockout. If the Government is given power to step in and compel the employer and employee to testify, to produce papers and records, it is attempting to substitute compulsion for voluntary consent at two important steps of collective bargaining. It introduces compulsory recognition and compulsory negotiation¹ under the guise of "compulsory testimony." The mere compulsion on employers, through prosecutions, as proposed by our colleagues, to compel employers to confer with unions, can have no result, unless it be accompanied by compulsion to investigate, as in the Canadian and Colorado acts, or to arbitrate, as in Australia. If employers are compelled merely to confer they can, of course, reject all propositions, and the nominal recognition of the union thereby secured would only be a further opportunity for declaring their determination not to

¹ These terms may appear ridiculous, but they are not more ridiculous than the term "compulsory arbitration." Arbitration, strictly speaking, is the voluntary consent of both parties to refer a dispute to a third person and to accept and carry out his decision. It is no longer "arbitration" if the Government coerces the parties by constituting itself the third party and compelling them to accept and carry out the decision. But if, in common usage, we have agreed to forget the absurdity of compulsory arbitration, we can also forget the same absurdity in the terms "compulsory recognition" and "compulsory negotiation."

recognize the union. If such a law is intended to accomplish anything it should go further and compel the employers to submit to compulsory investigation or compulsory arbitration, and this would mean compulsion also on the unions to confer and testify or to arbitrate.

In our hearings in San Francisco we found unions that refused to meet the employers for a joint agreement, but required them to sign up individually the demands which the unions had already decided upon. This can not properly be called collective bargaining or recognition of an employers' association any more than the decision of employers not to deal collectively but to deal with their employees individually. A law requiring employers to confer with and recognize unions should also require unions to confer with and recognize employers, and if this is made effective it would result in something like the Canadian or Colorado acts, described below. Employers who are strongly fortified against unions object to compulsory testimony because it weakens their bargaining power, but employers dealing with strong unions desire it because by recognizing the union they have already consented to investigation. Their next step is to compel the unions to wait for the investigation before striking.

This next step in collective bargaining is usually a provision that both sides shall continue at work or return to work while investigation and determination is in progress. This is, of course, the great object of arbitration, and practically all voluntary methods provide that work shall continue while arbitration is going on. This provision is recognized in the Canadian industrial disputes investigation act, latterly adopted by New Zealand and Colorado. The Government prohibits either side from a strike or lockout for 30 days, pending compulsory testimony and recommendation, but the parties are not compelled to accept the recommendation. After the 30 days have expired they may start their strike or lockout without any legal penalty. The Government meanwhile invites each side to appoint its representatives on a board of investigation and mediation and the two to select a third member. If either side refuses to appoint its representative the Government steps in and names the representative. If both sides are unable to agree on the third member the Government again steps in and names the third member. In other words, the Government coerces each side to go through the same forms that they would do if they agreed voluntarily to refer a dispute to arbitration, and it prohibits them from strike or lockout pending a finding and recommendation. This is compulsory recognition, compulsory negotiation, compulsory testimony, and compulsory labor pending investigation, but without compulsion after investigation.

On the other hand, the weak union favors compulsory conference and recognition because it seems to give it an advantage in bargaining. Both strong and weak unions are opposed to compulsory testimony because they get the equivalent by recognition, and they fear that it will lead to the compulsory waiting of the Canadian act. For these reasons the Canadian system should be put in the same class as compulsory arbitration, since the Government interferes to weaken or strengthen the collective bargaining power of either side. This

is the essential point of Government intervention. The term "arbitration" is misleading because it signifies the voluntary agreement on an umpire and the voluntary acceptance of his award. But arbitration can not be voluntary when the Government throws its coercive power to one side or the other by appointing a representative of either side, or an umpire, on the arbitration board without the consent of both sides. This is coercive interference with collective bargaining power, which is the essential element in compulsory arbitration.

For this reason it can not be claimed that the Canadian system is "voluntary arbitration." This term is also misleading. Collective bargaining is not voluntary in the same sense that individual bargaining is voluntary, since it depends on certain coercive weapons such as strikes, boycotts, blacklists, and so on, together with strategy in using these weapons, and these are not instruments in individual bargaining. All that is meant by voluntary arbitration is that the Government does not use its coercive power to weaken or strengthen the collective coercion of either side.

The first object of the Canadian law is the commendable one of bringing both parties together for investigation of the demands and grievances, with the hope that, by delaying hostilities for 30 days, time will be given for mediation, conciliation, and a voluntary agreement. For this reason the boards created are properly called boards of "mediation and investigation." It often occurs that within the 30 days both sides reach such a voluntary agreement and, if so, the board is dissolved after approving the agreement.

The second object is, in case a voluntary agreement is not reached by this kind of mediation within 30 days, that the publication of a set of recommendations by the board will bring to bear the pressure of public opinion on both sides so that they will feel obliged to accept the recommendations and continue at work. Compulsory recognition, negotiation, and testimony are used as the means of coercion through the support that public opinion may give to the Government.

But mere public opinion is not enough to accomplish this object. The next step is the compulsory arbitration of Australasia, which brings the power of fine and imprisonment to enforce an award made by a public official.

It is believed that any of these compulsory methods are unsuited to American conditions, and that the foregoing recommendation for a voluntary board of investigation, adapted from the Canadian act but without its compulsory features, will prove a valuable addition to the present Newlands Act, which goes only as far as voluntary arbitration in interstate railroad disputes. If one party or the other refuses to accept a board of arbitration with power to make a binding award, it is proposed that the mediator shall invite both to create a board of investigation with power to take testimony and to make recommendations which are not binding as an award. The jurisdiction of the Newlands Act is proposed to be extended under the Federal Commission to all labor disputes in all industries engaged in interstate commerce. It is believed that in many cases of serious public concern neither side can afford to reject an offer on the part of the Government to use its powers of compulsory testimony to ascertain the facts and to make recommendations, provided the

parties retain their liberty to reject the recommendations. The value of this proposal consists in the probability that a thorough investigation, participated in by both sides, may lead to agreement, as it has often under the Canadian act. But this should be brought about by consent of both parties and not by compulsory representation of either side, nor compulsory postponement of hostilities, as provided in the Canadian act.

The intent of the foregoing recommendation is that the mediator shall use all of the powers of persuasion that he can summon but is not to use, nor to be in a position to threaten or even to suggest the use of, any powers of coercion. Even compulsory testimony is to be used only in case he can persuade both parties to consent to its use. The mediator is not even permitted to make public any information he may acquire regarding a dispute, or to give that information to the Industrial Commission or to any other public authority that has the power of governmental coercion. Mediation and arbitration are to be voluntary throughout, as far as government is concerned.

The case is different with individual bargaining. Here it is recognized that the individual worker is at a disadvantage with the employer. In fact, he usually makes no bargain at all. He merely accepts or rejects the terms offered by the employer. Where this is so, and there is a public interest to be gained, Congress or the legislatures and the industrial commissions should exercise adequate compulsory powers to equalize and protect the bargaining power of individual employees.

It should be remembered that in the eyes of the law the labor contract is an individual contract—a contract between an individual workman and an individual employer. Even if the employer is a corporation of thousands of stockholders and bondholders, they are treated as a single individual for the purposes of a contract. But the law does not usually recognize a collective or joint agreement between a union and an employer or employers' association as a contract. The courts will not usually enforce it as they enforce individual contracts. Such a contract, so called, will not bind anybody by the force of law. A contract with a trade-union is not a contract in law; it is merely an understanding, or a usage, or a joint agreement that, when the real labor contract is made between individual employer and employee, it will be made according to the terms of the joint agreement. If an individual employer breaks the agreement by hiring a workman on different terms, the only means that the union has of enforcing the agreement is that of a strike. It is not a breach of contract. The union can not usually get an injunction or damages in court on account of the violation. In the same way the employer's only practicable remedy is the lockout. He probably can not bring a suit for damages, because the union agreement was not a contract. The legislature might, of course, change the law and provide for the legal enforcement of the collective bargain. This would be compulsory arbitration. But as it now stands a joint trade agreement is a kind of usage or understanding agreed to by two opposing interests and generally enforced on individuals by the coercive weapons of strike, lockout, boycott, or blacklist. It differs from a statute in the fact that its enforcement is left to private organizations or individuals while the enforcement of a statute

or order of a commission is effected by the penalties of imprisonment, fines, or damages. A minimum wage law, for example, may differ in no respect from a joint agreement with a union, except that the one is enforced by legal penalties or the threat of penalties, and the other by a strike or the threat of a strike.

The practical conclusion to be drawn from this distinction is that, since a State industrial commission may be both a mediator and a minimum wage commission, it should act only as a voluntary mediator where a union is actually in operation and securing agreements. But where there is no effective union there the minimum wage should apply. This is the condition of women and child workers, and for them the State, but not the Federal commission, should create advisory minimum wage boards, which, acting with the women inspectors of the commission, should make investigation and recommend the minimum wage and other conditions to the industrial commission. The last named would then hold public hearings and the rules of law would apply as already outlined in preceding paragraphs.

The same principle applies to other labor legislation which regulates the individual labor contract, such as child labor laws, workmen's compensation, safety, health, employment offices, legal aid, mechanics' liens, and so on. These are matters which are not usually an issue in collective bargaining even of unions composed of men, and do not usually lead to strikes or lockouts. Neither is the individual workman, in making his contract of employment, able to protect himself in these matters. When government here comes to the aid of the weaker party to the wage bargain, it is not usually intervening in the field of collective bargaining. The situation is different in matters of wages, hours of labor, and shop rules which govern the manner of work, dismissals, promotions, and so on. Where unions show themselves strong enough to protect individuals in these matters the function of government should, as far as possible, be limited to voluntary mediation.

It doubtless has appealed to some people who consider the employer's position more powerful than that of the union, that the employer should be compelled in some way to deal with unions, or at least to confer with their representatives. But, if the State recognizes any particular union by requiring the employer to recognize it, the State must necessarily guarantee the union to the extent that it must strip it of any abuses that it may practice. The State might be compelled to regulate its initiation fees and dues, its apprenticeship ratio, its violation of agreements, and all of the other abuses on account of which the employer refuses to deal with it. This is exactly what is done through compulsory arbitration, and there is no place where the State can stop if it brings compulsion to bear on the employers without also regulating by compulsion the unions. If so, the whole question is transferred to politics, and the unions which attempt to use a friendly party to regulate the employer may find a hostile party regulating them. We believe that collective bargaining and joint agreements are preferable to individual bargaining, and we believe that the general public should support the unions in their efforts to secure collective agreements. But this can only be done through the influence of public opinion without the force of law. It is based on the conclusion that two opposing organizations, equally strong, are able to drive out abuses practiced by the other. This is

very different from recommending that the Government should step in and drive out the abuses.

This conclusion and recommendation in favor of voluntary mediation is based also, in part, as already stated, on the distinction between collective bargaining and the individual labor contract. While Government for the past 80 years has been wisely interfering more and more with the individual labor contract, through child labor laws, wage payment laws, mechanics' liens, workmen's compensation, and so on, for the benefit of the weaker party, yet in matters of governmental interference with collective bargaining, we have to deal with great organized, hostile interests that are capable of using their power in the politics of the country, in the administration of labor laws, and even in the courts of justice. Any interference with their collective bargaining power forces them to get control, if possible, of the political parties or the executive and administrative officials, or the courts, that interfere. The result is more far-reaching and destructive than the mere decision one way or another in a particular dispute. It tends to corrupt or to discredit or to make inefficient the Government itself. This country is so large, with such extremes of sectional interests, with industrial and class interests, with nationality and race interests, and with such extremes of wages and costs of living, that it is an easy matter for these powerful organized interests to make alliances with others for the appointment or control of officials. When this is done, neither side can have confidence in the mediators or arbitrators who are chosen without their consent. A system, even though compulsory only in part, is likely to break down after a few decisions which are resented by either side. The department or commission responsible for the decision loses confidence and therefore usefulness. For this reason the weakest part of our recommendation is that the mediator shall appoint the third party to a voluntary board of arbitration or a voluntary board of investigation in case the two parties can not agree. It seems necessary that some authority be given that power. But the mediator is likely to lose the confidence of the side that loses in an arbitration, since he will be held responsible for the arbitrator whom he appointed. This might incapacitate him for future mediation. But we can think of no other agency that would be acceptable to both sides. If the mayor, or the governor or the President appoints the third man, employers would object. If the courts were to appoint him the unions would object. We are forced to recommend that this authority be given to the mediator, but we propose that he should not be tied down to any procedure that would prevent him from devising any system that his ingenuity might suggest rather than fall back on his precarious power of appointing the odd man.

After considering all forms of governmental compulsion in collective disputes and even admitting their partial success in other countries, we conclude that, on the whole, in this country as much can be accomplished in the long run by strictly voluntary methods as by compulsory methods of avoiding strikes and lockouts. It can not be expected that strikes and lockouts can be abolished altogether. Even countries with compulsory systems have not succeeded in preventing all of them. In our country, the voluntary method in collective bargaining avoids the much more serious evil of discrediting the agencies of Government which must be looked to for impartial enforcement of

laws affecting the individual labor contract. It is to the enactment and enforcement of laws protecting laborers as individuals that we must look for the removal of underlying causes of industrial unrest and for the eventual reduction of strikes that now spring from the cumulative abuses that individuals suffer without other effective remedies. But the removal of these abuses can not be accomplished without the efficient and nonpartisan administration of laws, and this is the main purport of our recommendation for industrial commissions to regulate the individual labor contract.

TRADE DISPUTES.

15. Congress and the State legislatures to enact laws similar to the British trades disputes act of 1906, relieving employers' associations and labor unions, as well as their members, officers, or agents, when acting in their behalf, of criminal suits, damage suits, and injunctions on account solely of combination or conspiracy connected with a labor dispute, when the act would be lawful if done by one person. Such laws would permit the use by either side without legal penalty of its weapons of closed union shop and closed nonunion shop, of strike and lockout, boycott and blacklist, peaceful picketing and strike-breaking, peaceful inducement to break a contract to work or to break off allegiance with a union, in pursuance of an effort to win a labor dispute. The law would not prevent prosecutions for conspiracy where the act if done by one person would be a crime. We copy below sections of the British trades disputes act as indicating the kind of legislation which with modifications to suit American laws would probably reach these objects:

Conspiracy.—An agreement or combination by two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy if such an act committed by one person would not be punishable as a crime. * * * An act done in pursuance of an agreement or combination by two or more persons shall, if done in contemplation or furtherance of a trade dispute, not be actionable unless the act, if done without any such agreement or combination, would be actionable.

Damages.—An action against a trade-union, whether of workmen or masters, or against any members or officials thereof on behalf of themselves and all other members of the trade-union, in respect of any tortious act alleged to have been committed by or on behalf of the trade-union, shall not be entertained by any court.

Breach of contract and interference with business.—An act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment, or that it is an interference with the trade, business, or employment of some other person or with the right of some other person to dispose of his capital or his labor as he wills.

Picketing and sabotage.—It shall be lawful for one or more persons, acting either on their own behalf or on behalf of a trade-union or of an individual employer or firm in contemplation or furtherance of a trade dispute, to attend at or near a house or place where a person resides or works or carries on business or happens to be, if they so attend merely for the purpose of peacefully obtaining or communicating information or of peacefully persuading any person to work or abstain from working.

Every person who, with a view to compel any other person to abstain from doing or to do any act which such other person has a legal right to do or abstain from doing, wrongfully and without legal authority—

1. Uses violence to or intimidates such other person or his wife or children or injures his property; or,
2. Persistently follows such other person about from place to place; or,

3. Hides any tools, clothes, or other property owned or used by the other person or deprives him of or hinders him in the use thereof; or,

4. Watches or besets the house or other place where such person resides, or works, or carries on business, or happens to be, or the approach to such house or place; or,

5. Follows such other person with two or more other persons in a disorderly manner in or through any street or road,

shall, on conviction thereof by a court of summary jurisdiction, or an indictment as hereinafter mentioned, be liable either to pay a penalty not exceeding £20, or to be imprisoned for a term not exceeding three months, with or without hard labor.

It is apparent from all the preceding recommendations that the creation of industrial commissions with advisory councils, depends for its success on the permanency of organizations of employers and organizations of laborers. It is only as we have organizations that we can have real representation. The preceding recommendations are designed, through salaried positions for civil service appointees and unsalaried positions for the representatives of organizations, to keep the latter continuously responsible to the organizations that elect and recall them. For this reason any policy of Government that tends to destroy the organizations or to compel them to hide their operations in secrecy tends to weaken the basis upon which improvement in the enactment and administration of labor law must be based. Such a policy is that which permits employers to collect damages, and in a lesser degree to secure injunctions against unions without at the same time effectually permitting unions to bring similar proceedings against employers' associations. The decision in the case of the hatters' union (208 U. S., 274) awarding heavy damages for boycotting against practically all members of the local union, will make it possible to collect damages in all cases where an unlawful conspiracy is shown. Since damages arise from all strikes and boycotts, there is no conceivable limit to which suits for damages can be brought. The result must be the weakening or destruction of unions or driving them into secrecy and a more generally avowed policy of violence.

This policy also brings the courts into the field of collective bargaining, and necessarily leads, sooner or later, to the efforts of both sides to control the judicial as well as the administrative and legislative branches of Government. Just as our earlier recommendations were intended, in part, to take the administration of labor law out of the hands of either side and to make it a joint affair, so this recommendation is intended, in part, to relieve the courts of similar partisanship in matters of collective bargaining. It is believed that strong organizations of employers and employees are much more capable than the courts of holding each other in check and preventing abuses on either side. The recommendation is intended to recognize the collective weapons of both sides as the means of securing this result, and yet, through the Industrial Commission and its advisory council, including mediators and the efficient enforcement of labor laws, to minimize the necessity of resorting to these weapons.

The so-called Clayton Act of 1913 was supposed by some lawyers to accomplish the result intended in the foregoing recommendation, but other lawyers contend that the law of conspiracy has not been changed by the act. At any rate, the law does not apply to the States, only one of which, California, has adopted a similar law, and

another, Massachusetts, has withheld adoption owing to an unfavorable reply by the Supreme Court on the question propounded by the legislature. It is admitted that the British act accomplishes the intended purpose, and consequently we take it as the model in case these other acts are found, under court decisions, not to do so.

The recommendation is, as already said, intended to prevent the courts from interfering with the collective weapons, provided they are peaceful, that either side uses to defeat the other side. It is recognized, of course, that these weapons are coercive and are intended to be coercive, but they are not coercive in the sense of physical violence. They are coercive only in the sense that numbers of people acting together to do an act lawful for each separately have more power over individuals than a single individual acting by himself would ordinarily have. But even an individual acting alone may have the same kind of coercive power, which in his case would be lawful, as, for example, when an employer compels a union man to give up his membership in a union by threatening to discharge him if he does not. This kind of individual coercion is held to be entirely lawful, and any State or Federal statute which prevents the employer from using such coercion is unconstitutional. This is so even if the employer is a corporation with thousands of stockholders and bondholders, for the corporation is held to be, for that purpose, not a conspiracy, but a single person. By declaring laws unconstitutional which attempt to deprive the employer or corporation of the right to discharge a man on account of his unionism, the court steps in to prohibit the State from depriving the employer of a coercive weapon used to defeat the union. It prohibits a State from depriving an employer of the closed nonunion shop as a coercive weapon against unions.

A counterweapon which the union has is the closed union shop. If the employer discharges or threatens to discharge one of his employees on account of his membership in a union, the only effective weapon that the employee may have, in order to retain his membership, may be a strike or the threat of a strike by his union to compel the employer to discharge all nonunion men. In some States a strike for such a purpose, under the decisions of the courts, is unlawful, on the ground that it is a conspiracy to compel the employer to give up his right to employ whom he pleases, or a conspiracy to deprive the nonunion man of his right to work for whom he pleases. The foregoing recommendation is intended to make it plain that no employer or union of employers shall be prevented by law or by a court from running a closed nonunion shop if he can, and no union shall be prevented from compelling him to run a closed union shop if it can, so long as the method would be lawful for a person not backed by a union.

In a similar way it is lawful for an employer to furnish other employers, whether members of his association or not, with information as to whether an employee is a member of a union or a union agitator, and to file such information in the employment bureau of an employers' association. If the workman can not prevent his employer by law from discharging him on account of unionism, much less can he require another employer to hire him. It is lawful also for an employers' association to expel a member who refuses to comply with a nonunion rule, and, except in case of a public utility, to

refuse to deal with him or to discriminate against him. Furthermore, since other employers' rights of furnishing information to fellow employers are so great, it is practically impossible to get proof that they contain the malicious purpose which constitutes a blacklist, and statutes preventing employers from using some of these legal rights have been held unconstitutional. But, as a rule, the employers' blacklist does not need to go to these extreme measures permitted by law, because it is effective short of these measures.

The case is different with the union's weapon, the boycott. To carry out a boycott the union must circulate "unfair lists" and must induce as many persons as possible to withdraw their patronage. The courts distinguish between the primary boycott and the secondary boycott. The former is perhaps legal in some cases, just as a strike is legal, for it is merely the refusal to patronize an employer on the part of the same persons, or their fellow unionists, who have struck against the employer, or who are locked out or blacklisted by him or his association. It is doubtful, though, whether this primary boycott is legal if it extends to members of unions other than the one directly injured. The American Federation of Labor, for example, can not carry out a primary boycott on goods which the hatters' union has boycotted, since it is prohibited from publishing the information. And even the strike and the primary boycott are sometimes unlawful if the court holds that the purpose or the means are unlawful. The courts will not directly enjoin either a strike or a primary boycott. They can not compel a man to work or to purchase. But they can make the unlawful strike or primary boycott ineffective by enjoining even peaceful picketing or persuasion, or the circulation of "unfair lists" designed to notify others that the boycott is on.

But the secondary boycott is generally held illegal because it is an additional boycott placed upon a third party, usually a merchant, who continues to sell the goods of the boycotted employer. As to this third party the boycott is primary, and he can secure an injunction or damages on the ground of conspiracy to injure him without just cause, or to compel him to break a contract, if he considers the damage to himself worth while. But boycott suits are not often brought by third parties, either because the damage to them is usually slight, since they only need to patronize other manufacturers whose goods the boycotters are willing to buy, or because the courts protect them through suits brought by the party originally boycotted. The employer originally boycotted would not secure protection if he depended on a hundred or a thousand boycotted merchants not seriously concerned to bring separate suits. Consequently the vast majority of boycott cases are brought by the person primarily boycotted, in order to prevent the spread of boycotts to other persons who deal with him; in other words, to prevent a secondary boycott against himself. The boycotted employer hides behind the alleged injury done to third parties in order to get damages, not for them, but for himself, as in the case of the Loewe Co. against the hatters' union. The ground of action is not injury to third parties, but interference with the employers' right to have free and uninterrupted business dealings with all who wish to deal with him. This does not seem to be equal treatment of the employers' blacklist which interferes with the unionists' right to have uninterrupted

access to all employers, and the employees' boycott which interferes with the employers' right of access to the commodity market.

The arguments now used to declare the secondary boycott illegal are those formerly used to declare the strike and the primary boycott illegal. Our recommendation simply carries forward another step the effort to secure equality between organized capital and organized labor.

Of the other weapons, the strike and lockout, the employers' association does not usually employ its weapon, because it can force the union to strike or yield, but the strike is illegal if the purpose is illegal, such as the purpose in some States of securing a closed union shop. The recommendation is intended to remove all illegality from the strike.

This recommendation is intended to do away with the doctrine of conspiracy for both employers' associations and labor unions, except in so far as the conspiracy is one to commit what would be a crime for one person, and to do away with all suits for damages, including injunctions to prevent damage, against a union or against its members when acting for the union, except suits for damages against conspirators to commit a crime.

The doctrine of conspiracy is based on the undoubted fact that, while a lawful act done by only one person may be coercive and cause damage, or be intended to cause damage, yet the coercion and damage are ordinarily so small, compared with the social advantage of liberty to do as one pleases, that, except in breach of contract, the court does not entertain a suit at law for damages or for prevention of the coercion that causes damages. Yet the same lawful act, if done by agreement between two or more persons, may reach a point of coercion where the damage, compared with the social advantage of liberty to combine with others, is so serious that the agreement becomes unlawful. Therefore, those who enter into an agreement to do an act which would be lawful without the agreement, or their agents, may be prosecuted for damages or may be prevented by injunction from using the coercive power of numbers to cause the damage. It is this doctrine of conspiracy, or coercion through mere numbers, that is sought to be removed by the recommendation. Individuals and the individual members of unions who conspire with them would continue to be arrested, prosecuted, and punished as individuals or conspirators for all acts which are criminal for them as individuals, but no suit for damages could be brought against the union for acts committed by or on behalf of the union.

In other words, the recommendation removes completely the doctrine of civil conspiracy according to which damages may be collected or injunctions issued. It, however, retains the doctrine that all conspirators who join in procuring an act that is criminal for one person to do are likewise guilty with the person who does it. This might include all the members of a union if all were proven actually to have joined in such a conspiracy. Those who conspired could still be prosecuted and sent to prison, as was done in the case of the officers and members of the structural iron workers for transporting dynamite. The recommendation is not intended to change the law in this respect. It would change the law in the *Hatters' case*.

Employers are already learning the ineffectiveness of the injunction and the danger to themselves of throwing on the courts the

burden of protection which they can as readily secure through their own organizations. With their advantages of position, both as owners of the means of livelihood and the possessors of the power of discharge and of blacklist of union members which goes with the ownership of property, they have a superior power over unions. Our recommendations do not grant employers' associations rights additional to those which they now enjoy in fact; they merely grant the unions corresponding rights.

The British act also defines the kind of picketing that is criminal in that it is not peaceful, and thereby defines what is peaceful picketing. In these cases of illegal or criminal picketing and in the destruction or damage to physical property those who have done the criminal acts and those who have conspired to have them done may be fined and imprisoned, but the union funds or the property of its members not proven to have joined in the criminal conspiracy could not be taken for damages.

Without entering into further details, the object of the recommendation is to place unions and employers' associations upon an equal basis in the use of their competitive weapons.

Regarding the constitutionality of this recommendation it should be noted that it takes both employers' associations and unions from under the operation of the antitrust laws. This differs from the Clayton and other acts which take only unions from under the antitrust laws or common law and might be good ground for declaring these laws unconstitutional. The British act does this by distinguishing between employers as merchants or associations of manufacturers, who sell commodities to the public, and whose bargain may be called the "price bargain," and the same employers in the different function of dealing with labor, and whose bargain is the "wage bargain." The employers, in their function of merchants and manufacturers, or sellers of products or commodities to consumers or the public, continue to come under the antitrust laws, and the Interstate Commerce Commission, the Federal Trade Commission, and the State public utility commissions have been created for the purpose of protecting the public against them as such. These commissions regulate price bargains for commodities or products, between corporations and consumers.

But it does not follow that even the same employers when organized to regulate the wage bargain with employees should be treated as a conspiracy or trust. They perform a very different function and public policy is very different. In the case of the price bargain the public is interested in securing low prices, but in the case of wage bargain it is interested in permitting high wages. Yet the public needs protection against abuses of labor unions as it does against the abuses of trusts. The employers' association stands between organized labor and the public just as the railroad and public utility commissions and the trade commission stand between merchants' or manufacturers' associations and the unorganized public. But the employers' associations are a better protection to the public against the abuses of unions than are the courts. Labor leaders who wish to keep discipline in their unions and the observance of joint agreements realize that they can not do so unless confronted by a strong employers' association. They realize that continued abuses lead eventually to the destruction of their unions. An employer who

stays out of his organization is as culpable as a laborer who stays out of his union. Employers should organize 100 per cent just as the unions endeavor to reach that mark.

It would, therefore, seem to be proper and constitutional classification in the interest of public policy to treat manufacturers under a law prohibiting or regulating trusts and public utilities and to treat the same persons as employers under different laws, like those of mediation and trade disputes, where both employers' associations and trade-unions are given immunities for the use of peaceful coercive weapons which they do not possess under the antitrust laws.

FOUNDATIONS.

16. Considerable attention has been given by this commission to the largest foundations or endowments now in the hands of private trustees. Any proposed legislation on this subject should be preceded by a complete investigation of all foundations and endowments, else the law would have effects not contemplated by the legislature or Congress. Such an investigation would include all endowed charities, endowments of religious organizations and universities and colleges. We are informed that such investigations have been made in England and France, resulting in legislation. The investigation should be complete, covering all aspects of the question and bringing out both the advantages and the disadvantages of such foundations and endowments. The legislature could then act intelligently on the subject.

We are convinced that many of these endowments in private hands have a beneficial effect on the work of State and governmental institutions. Large private universities have set the example and stimulated the States to support and enlarge their State universities. Some of the investigations and reforms started by recent large foundations have already induced Congress and administrative departments to enter the same field and to extend it. In fact, almost everything that Government now does was done at first through private initiative, and it would be a misfortune if private endowments, unless plainly shown to have committed abuses, should be prohibited. Even their abuses can be rectified by the legislature through its control over charters, if reasonable ground can be shown. But it is better, for the most part, that they should go on at their own initiative in order that the people through their Government may see the value of their work and then take it up and extend it more widely than the private foundations are able to do. It is largely for this reason that we recommend a "Federal fund for social welfare" (par. 18), in order that the Nation may compete with or displace private foundations in this vital matter.

However, experience has abundantly shown that there should be no alliance between these private foundations or endowments and the Government. The State or Government should neither subsidize them nor be subsidized by them, nor cooperate with them. Such cooperation has often led to public scandal. Instead of subsidizing private charity the State should use its money to displace it by better and more universal charity. Instead of calling upon private foundations for help, the Government should treat them as competitors.

No effort on the part of Government officials to secure financial assistance from them should be allowed.

SUBSIDIES.

17. The Federal commission to have charge of all subsidies granted to the States for the promotion of industrial education, safety, employment offices, and other matters, as Congress may determine. The commission to meet the expenses of State officials when called together for conferences on standards and uniformity. Subsidies to be granted on condition that the standards are maintained.

The Public Health Service now has authority to call conferences of State health officials and to meet their expenses. The same power should be given to the proposed industrial commission. A large part of the work of the commission will be the field work of advising State officials as to the best methods of administration. This kind of work is now done by the Department of Agriculture and the Public Health Service.

Subsidies are recommended in certain cases because the State governments are not in position to secure adequate funds and as an inducement to bring their standards up to the standards formulated by the Federal commission.

(Funds for this purpose are recommended in paragraph 18.)

FEDERAL FUND FOR SOCIAL WELFARE.

18. A Federal inheritance tax on all estates above \$25,000, beginning at 1 per cent on the excess above \$25,000 and rising to 15 per cent on the excess above \$1,000,000 for the class of direct heirs, such as wife, children, and parents. Higher rates for more remote relatives and strangers. The Federal inheritance tax to be a supertax, added upon the existing rates assessed by the States. Provision, however, to be made that any State which repeals all inheritance tax laws, or refrains from enacting them, shall receive from the Federal Government, say, 50 cents per capita of its population per year. The administration and collection of this tax to be placed in charge of present assessors and collectors of income taxes, who already collect income taxes on estates in the hands of executors. Revenues derived from inheritance taxes to be placed in trust with the Federal Reserve Board for investment in securities approved by Congress. The fund to be known as "Federal fund for social welfare." Expenditures of income derived from such securities to be made under the direction of the Federal industrial commission for such purposes of industrial and social welfare as Congress may authorize. Should the income from investments not be adequate to meet the authorized expenditures, further investments to be withheld and the principal to be expended. Revenues derived from activities of the commission, such as head tax on immigrants, etc., to belong to the fund. Also unexpended balance to be held in the fund for disposition by Congress.

A similar fund collected from immigrants in excess of the expenses of the service is held with accruals for disposition by Congress.

We have previously shown the need of improved administration in providing for any future program of social legislation. We have held that it is useless to undertake any additional labor legislation if effective, nonpartisan machinery of administration is not provided, but even with such machinery it can not be expected that the expense of government will be reduced. In fact, the expenses will be increased, and no legislation should be attempted unless the possibility of getting these revenues is fully considered.

Moreover, these revenues must be continuous, else the whole program will be liable to sudden breakdown through failure of funds. Hostility to labor laws is just as effective when it succeeds in killing appropriations, on the ground of economy, as when it defeats the law itself.

Already the increased expense of administration of labor laws is bringing active and effective protest. The greatest leap in this expense has come with workmen's compensation. So far as this increase is due to inefficiency of the existing political and partisan methods of administration the protest is valid. The remedy consists in improving the efficiency and eliminating the partisanship, and this is the purport of what we have previously said. So far, also, as the increase places excessive burdens of taxation on the already burdensome taxes of the people, the protest also is valid. But here the remedy consists in discovering new sources of revenue that will not be burdensome.

A Federal inheritance tax, partly distributed to the States, seems to be the most appropriate method of securing these new sources of revenue. The principal underlying cause of social unrest is the uncertainty of income of wage earners and small producers. A steady, continuous income, even though it be small in amount, is of more importance than high wages or earnings at certain times and no earnings at other times. This uncertainty of income is the main cause of the dependence, inequality, and oppression which produce conflicts between capital and labor.

The great majority of wage earners can not provide in advance for future contingencies when they will get no income. These contingencies come from accidents, sickness, invalidity, old age, death, unemployment, and the lack of industrial education.

There are two main reasons for this inability to provide for contingencies: (1) Inability in bargaining for wages to take into account future contingencies and future cost of living. The wage earner may be able when bargaining to get enough wages for current cost of living, but he does not include insurance premiums in his notion of current cost, except so-called "industrial insurance" to provide for funeral expense. (2) Lack of thrift and habits of saving, owing in part to their own fault and in part to the contingencies which eat up their savings and bring discouragement. In either case, under competitive industry, the condition may be accepted as permanent.

On the other hand, employers and investors are much more able to provide in advance for a future continuous income against contingencies. All investments are made with reference to equalizing the flow of income over a future period of time in the form of interest or dividends.

Inheritances are the principal means by which owners, without effort or thrift on their part, secure titles to wealth and its future con-

tinuous income. Consequently, for the Government to take a part of large inheritances which provide continuous incomes and to devote the proceeds to the purpose of making incomes more nearly continuous for those who are not able, under existing conditions, to do it for themselves appeals to the sense of justice. It may be accepted in advance that men of wealth will approve of an inheritance tax on two conditions, namely, that the tax will be devoted to a great public purpose, and that the funds will be administered economically and efficiently without partisanship or practical politics. These two conditions are essential and are contemplated in our recommendations for a Federal industrial commission and a Federal fund for social welfare.

Some of the purposes for which this fund might be used, in order to meet the object of social welfare, are, in addition to the overhead expenses of the commission, the safety and health agencies of the Federal Government and, perhaps, subsidies to States conforming to standards; industrial education and subsidies to States; Federal employment offices and subsidies to States which adopt an approved plan coordinating with the Federal plan; Federal supervision of private employment offices doing interstate business; investigation and statistics of labor conditions; mediation; administration of immigration laws; workmen's compensation and subsidies to systems of sickness, unemployment, and other forms of social insurance as may be approved by Congress. Opportunities for investment should be considered, such as workmen's houses, workmen's hotels, hospitals, rural-credit associations, and similar investments made by Germany in respect of its various insurance funds.

It is impossible to estimate at this time the revenue that would be derived from such a tax. We have estimated the amounts now collected by the States from inheritance taxes at \$25,000,000, as against the \$50,000,000 that they would receive at 50 cents per capita. The present systems in vogue in 32 States yield revenues from \$1,096 in Wyoming to \$11,162,478 in New York. The amount per capita of population ranges from 1 cent per capita in Texas and Wyoming to 59 cents in Connecticut, 66 cents in Illinois, 68 cents in Massachusetts, and \$1.28 in New York. The latter four States would lose if they abolished their inheritance tax and accepted the Federal distribution of 50 cents per capita. Other States would gain. Yet this can not be considered a just criticism of the proposal, for the States which lose are those in which wealthy people choose to reside and yet their fortunes arise from ownership of property scattered throughout the country. The present system of State inheritance taxes practically permits a few States to collect taxes on property whose value is created by many of the States. A Federal inheritance tax is the only method by which the entire Nation, which contributes to the value of estates, can secure revenues from the values which it creates.

The recommendation of returning 50 cents per capita to the States is designed to induce them to turn over to the Federal Government the sole right of imposing inheritance taxes and yet to preserve to the States at least a part of such preempted claims as they may have acquired by getting into the field first.

The Federal machinery is already in existence for collecting income taxes, and the same officials, without any appreciable increase

in the number, can assess and collect inheritance taxes. Executors of estates whose annual incomes amount to \$2,500 or more per year are now required to make returns to collectors of internal revenue, and the only addition required for an inheritance tax is that executors of estates of \$25,000 should make returns of the total value of the estates. This can, of course, be done at the same time when they fill out the blanks which show net incomes. Internal-revenue officials also investigate all cases where it is suspected that full returns of income are not made. No additional officials are therefore required for these purposes. The only addition would be such number of officials as are required for general supervision. The machinery is already in existence, and no tax can be so cheaply administered as a Federal inheritance tax.

The significant feature of the proposed inheritance tax is the high rates on direct heirs, as compared with the very low rates imposed in the States. The estates going to wife and lineal heirs include probably 80 per cent to 90 per cent of all estates, and it is therefore from such estates that the largest revenues are expected. Such estates are scarcely touched by American inheritance tax laws. The sensationally high rates imposed in some States on estates going to strangers and remote heirs are something of a delusion, for scarcely 5 per cent of the estates go to such beneficiaries. The rates on estates going to strangers reach their highest figure at 35 per cent in California on the excess over \$1,000,000 and fall as low as 5 per cent in Pennsylvania and other States. But the rates on the excess over \$1,000,000 going to direct heirs is only 10 per cent in California and falls to 1, 2, or 3 per cent in most of the States. Our recommendation affects mainly these estates going to direct heirs, which are 80 to 90 per cent of all estates, and the highest rate on such estates is 15 per cent on the excess over \$1,000,000. This conforms more nearly to the inheritance taxes of leading European countries which would yield according to various estimates over \$200,000,000 if adopted by the Federal Government of this country.

The following administrative reasons for making the inheritance tax a Federal tax are submitted by Prof. T. S. Adams, of the Wisconsin tax commission, who also suggests the repayment to States as a method of inducing them to yield to the Federal tax. He says:

1. The present system gives rise to a large amount of double or multiple taxation and if the existing laws were enforced, the situation would be unbearable. Most State laws tax the transfer of all securities owned by resident decedents and yet attempt to tax the transfer of some securities owned by non-resident decedents when they represent property in the State passing the law. I have known one block of railroad stock to be assessed in Wisconsin (residence of decedent), in Illinois (where the stock was deposited in a trust company), and in Utah, where the railroad was incorporated, and it is not unlikely that other States through which the railroad passed imposed a tax before the estate was finally settled. Four different and conflicting taxes are thus in use at the present time.

2. At present administration of such laws is costly, ineffective, unjust, and capricious. Wisconsin attempts to tax the transfer of all securities representing, however indirectly, property in Wisconsin. It is impossible where holding companies hold the stock in the companies immediately owning the Wisconsin property. To enforce it, particularly where bonds are concerned, agents must be employed outside the State. We keep two—in New York and Chicago. We should have an agent in every place in the country where estates are probated. To enforce the Wisconsin interpretation would cost an enormous sum.

3. Yet the Western States are insisting on the Wisconsin idea in inheritance taxation. As they do so, double taxation and cost of administration must increase greatly. Cost of administration has not been excessive in the past, merely because the laws have not been enforced.

4. Except in a few States the yield of the inheritance tax is very irregular. The proposed commutation payment by the Federal Government would substitute a regular for an irregular State revenue, besides greatly decreasing cost of collection—or prospective cost of collection.

5. Rich men change their rendezvous very easily. Rhode Island and a few other States do not tax inheritances at present. They do and can prevent the proper development of inheritance taxes in other States. It is the compulsion of the "twentieth man."

6. A number of States can not employ progressive rating in inheritance taxation—an essential attribute of sound inheritance taxation.

IMMIGRATION.

19. Underlying the entire problem of self-government in this country, and placing a limit on the ability to remedy abuses either through politics or labor unions, is the great variety of races, nationalities, and languages. We know how the Southern States have dealt with the problem and how constitutional amendments forced upon them by the Northern States have been treated. Considering this outcome, it is doubtful whether the additional proposed amendments designed to protect rights of individuals in those or other States would accomplish the ends intended.

A similar problem is forced upon us by the large immigration of backward races or of classes from other countries with no experience in self-government. One of these races, the Chinese, has been actually excluded from immigration. Others less competent are admitted. The doctrine of a haven for the oppressed has been rejected in the case of the Chinese and can not consistently be raised against restriction on immigration designed to accomplish a similar purpose of protection to Americans. Especially is the problem of the Americanized element in the labor unions in maintaining discipline almost insoluble when it comes to dealing with 10, 20, or 30 races or languages. The right of employers to bring aliens into their establishments is the same as their right to bring in naturalized or native Americans. The resulting situation is the great strikes recently entered upon without previous organizations or discipline by nationalities that have suddenly come together, notwithstanding their racial antipathies and language impediments, on account of a united antagonism against their employers. Such strikes receive but little consideration from American police, sheriffs, and militia and are usually defeated. On account of their incapacity for self-government, it might perhaps be shown that in isolated communities the paternal despotism of a corporation is preferable to unionism or political control by these backward nationalities. The violation of contracts and inability of their leaders to maintain discipline and observe contracts, which make some American employers so determined against recognizing unions, may often be traced back to the unruly mixture of races and nationalities whom they have employed. Other problems, such as those of the political franchise, must be taken into account in any measure designed to further restrict immigration, but we are convinced that very substantial restrictions on immigration, in addition to the present restrictions, should be

adopted, and that comprehensive measures should be taken to teach the English language and otherwise "Americanize" the immigrants. One of the principal services of American trade-unions is their work in teaching immigrants the practice of democratic government. They might almost be named as the principal Americanizing agency. Another promising measure is the so-called social center, designed to use the schoolhouses and public buildings for instruction and discussion outside school hours. Such a measure, if adopted by all States, as has been done by some, would be of advantage also to native Americans in the free discussion of public questions.

Since immigration is one of the principal issues between capital and labor, its administration should be turned over to the proposed Federal industrial commission, where capital and labor will have an equal voice. This would place all administrative positions in the service, up to and including the Commissioner General, under the civil-service rules proposed in paragraph 3. In 1905, when a trade-union man was Commissioner General, he was required by the administration to give written or oral instructions to inspectors not to make any arrests of Chinese for deportation as required by law. (Washington file, 15427 1 C.) Instead of resigning and making public protest he yielded and gave the required instructions, which practically nullified the law by preventing the deportation of smuggled Chinese. Had such orders been required to be submitted to the advisory council, as proposed in these recommendations, a public protest would have been made by the labor members of the council, since they would be responsible to their unions and not to the Government for their salaries. Even now, with the many charges of Chinese smuggling, the presence of unsalaried labor representatives on an advisory council, with the right to have access to all the records and to have all orders submitted to them before issuing, would place them in a position to prevent such secret violations of the law. In addition they would receive through their fellow-unionists throughout the country complaints or evidence against inspectors supposed to be in conspiracy with Chinese smugglers and would be in position to present their charges and to require investigation and removal if necessary. Various outside commissions, including this commission, have been required to investigate the matter of Chinese smuggling, but they are baffled. The advisory council proposed would be a continuous commission not terrified by any political administration and having a voice in the appointment and removal of inspectors under civil-service rules. (See par. 3.) Doubtless appeals from the commission to the Department of State and the President should be allowed in cases involving political refugees and the interpretation of treaties with foreign countries. These are substantially our conclusions derived from the attempted investigation of Asiatic smuggling.

FARMERS AND FARM LABORERS.

20. One of the growing evils to be feared is the increasing congestion of populated centers at the expense of the rural districts. This is true not only of America but also of Europe. The allurements of the city tend to draw annually thousands from the country to the city. Congested cities, especially in hard times, mean enlarged ranks of the unemployed.

This tendency is strengthened where the struggle of the small farmer not only to hold on to his land but to make a living becomes hopeless and where the conditions are such that the farm laborer or the farm tenant sees little or no possibility of becoming a future landowner.

Not least among the causes of higher cost of living has been the tendency to increase city populations at the expense of agricultural populations, thus decreasing relatively the supply and increasing the demand and thereby inevitably raising the cost of food.

The last census shows that we are becoming the victims of increasing absentee landlordism and farm tenancy. It points out that while the number of farm owners during the preceding decade increased 8 per cent, the number of farm tenants increased 16 per cent. If this ratio should continue for a few more decades, many parts of our Republic will find themselves in the condition from which Ireland has so recently emerged.

For many generations Ireland was one of the most distressed countries in the world. All of its evils were due primarily to absentee landlords and farm tenants. But within the last decade a wonderful change has taken place in the social and economic condition of the Irish peasant, brought about by the enactment by Parliament of what has since become known as the Irish land bill. This act created a royal commission, with power to appraise the large Irish land estates owned by absentee landlords, at their real and not at their speculative value, to buy them in the name of the Government at the appraised value, plus 12 per cent bonus, to cut them up into small parcels, to sell them to worthy farm tenants, giving some 70 years' time in which to make small annual payments on the amortization plan, the deferred payments bearing but 3 per cent interest. In addition to this, the Government made personal loans to peasants sufficient to cover the cost of stock and farm implements, also payable in small annual installments bearing a minimum rate of interest. The Government further furnished the various farm districts with farm advisors, trained graduates from agricultural colleges, who act as friend, adviser, and scientific farm instructor to the peasants. Within a decade the wretched and more or less law-breaking farm tenant has been converted into an industrious, progressive, and law-abiding landed proprietor; in fact, he has become so law-abiding that many jails in the farming districts, formerly filled with agrarian criminals, have been converted into public schools.

In Texas this commission found a condition of farm tenancy like that of Ireland and seemingly typical of growing conditions in various parts of the country. We therefore recommend to Congress and to the various States that steps shall be taken to lighten the burdens of the small farmer, and make it more possible to encourage the tenant, farm laborer, and city dweller to become land proprietors.

Not least among the burdens of the small farmer is the great difficulty, as a rule, on his part in obtaining the necessary credit with which to better and to improve his land, at a low rate of interest and under terms that will permit him to make payments spread over a long term of years.

Under the rural credits system of Germany a small farmer can borrow his money as cheaply as can a great banker. Not only can he do this, but he can spread the payments over a period of 30 or

more years. It is this system of rural credits, among other things, that has made it possible for the German farmer, despite the high price of his land, his heavy taxes, and his small acreage, not only to successfully compete with the American farmer, but to enjoy a fair degree of prosperity; so much so that in more recent times there have been comparatively few German agriculturists who have emigrated to this country.

We therefore recommend that Congress and the various States pass rural credit acts that will give to the small American farmer the same privileges and benefits that for so long a time have been enjoyed by the small farmers in Germany and other European countries, which, following Germany, have adopted rural credit systems. We recommend serious consideration to adapting the Irish land bill and the Australian system of State colonization to our American conditions. It is not our intention in this report to enter into minute details as to how this should be carried out. In a general way, however, we believe it not only desirable but practicable for the Federal Government, through its Department of Agriculture, and the various States, through their departments of agriculture, to secure large bodies of land at appraised actual values, that have been thoroughly tested by experts for their quality, issuing bonds for the payment for same, if need be, and to cut them up into small parcels, making the necessary improvements and selling them to qualified colonists with small first payments, making the balance payable in, say, 30 years on the amortization plan, the deferred payments bearing only the same rate of interest that the Government itself is called upon to pay, plus a small addition to cover the cost of Government administration. We believe in this way the most effective check can be created, on the one hand, to minimize farm tenancy and, on the other hand, to make it possible for the farm laborer and the farm tenant to become land proprietors. We believe that this, if carried out wisely and intelligently, will have a large share in minimizing industrial unrest and in adding to the wealth of the Nation, both materially and in the quality of its citizenship.

CORPORATION CONTROL.

21. Corporation control over politics and labor has for a long time been a well-known matter of serious concern in all American States. This commission has held hearings on the subject of such control in isolated communities at Lead, S. Dak., Butte, Mont., and in Colorado, and other communities were partly investigated by a member of the staff.

In Lead we found a strong union had recently been driven out on account of its sudden demand for the closed shop, and this was followed by a paternal absolutism that controlled labor, business, and politics. In Butte we found a strong union split into factions and destroying its own property, followed by refusal of the corporation to deal with either faction. In Colorado we found a long history of refusals to deal with unions, accompanied by strikes at intervals of 9 or 10 years. In each of these cases the ownership and control of the property was in the hands of absentees, who left the operating management to executives on the ground.

We condemn the conditions found in Colorado which show the control of corporations over labor and politics, and we find there a

system that has taken hold throughout the country. Here the serious problem is not the personality of any individual who may or may not be responsible, but the correction of a system which has grown up mainly under absentee ownership and which determines the acts of individuals according to their self-interest within the terms prescribed by the system. Immediate and public action is necessary to see that courts of justice are not prostituted to the service of one class against another, but the huge system of corporate control requires more far-reaching remedies before attainment. Absentee ownership can not be brought to the sense of its responsibility without the enactment and adequate enforcement of workmen's compensation for accidents and occupational diseases, sickness, invalidity, and old-age insurance. Meanwhile a partial method of meeting its responsibility is a staff of safety, health, and labor commissioners, independent of the local executive staff, to report directly to the board of directors. The work of such a staff is directly in conflict with that of the executive staff, for the latter must get out "production" while the other must acquaint the directors and company with the oppression of labor which increased production and lower costs often bring. The labor department can not be made subordinate to the executive department if the corporation really intends to safeguard its employees.

We are not in favor of public ownership as solely a matter of improving labor conditions, and before such can be recommended there should be a more complete investigation and regulation and a clearing up of the values that will be paid and the administrative control that will follow. More immediate and necessary is a series of laws that will take the control of politics out of the hands of corporations and place it in the hands of the people. Several of our previous recommendations are intended to accomplish this purpose in so far as labor and capital are concerned, but we should add effective corrupt practices acts, designed to protect the secret ballot, to limit the amount of money and number of paid electioneers in elections, to prevent intimidation, and so on, as far as elections are menaced by political machines and wealth. Direct primaries for the nomination of candidates, protected by corrupt practices acts. Constitutional and legislative initiative for State and Federal Governments. The initiative would permit the people to change the Constitution at any point where the courts had depended upon it for a decision, and would make unnecessary any provision for recall of Supreme Court judges or of their decisions, or of taking from higher courts their power to declare laws unconstitutional. The recall of elected officials, including executives and judges of the lower courts, but not judges of the supreme courts or members of the legislature. Proportional representation, as adopted in Belgium, South Africa, Australia, and the Irish parliament, by which all parties or factions would be able to elect their own representatives in the legislatures or Congress in proportion to their numbers and without making deals with other parties. This would permit a labor party to have its representatives, as well as other minor parties, and would permit women, who we consider should have the suffrage, and other minor parties to elect their own representatives without making compromises in order to get the votes of the major parties. These minor

parties, containing as they do the advanced views on labor and social problems, are entitled to their proportionate share of influence in the legislatures or Congress. It can be seen that such a measure would take away from corporations much of their present inducement to control the great parties. It would furnish a legislature which would be a true reflection of the wishes of all the people. This recommendation applies to the legislature the principle of representation of interests, which we advance in the case of the advisory council to the Industrial Commission.

JOHN R. COMMONS.
FLORENCE J. HARRIMAN.
HARRIS WEINSTOCK.¹
S. THRUSTON BALLARD.¹
RICHARD H. AISHTON.²

NOTE.—Commissioner Weinstock also presented the following dissenting opinion:

I dissent from the report prepared by Commissioner Commons on the question of immigration. That report says:

We are convinced that very substantial restrictions on immigration, in addition to the present restrictions, should be adopted.

I am of the opinion that we have abundant immigration laws already on our statute books which, if enforced, will keep out of the country unfit immigrants. In normal times this country can profitably employ all the desirable and fit occidental immigrants that knock at our door, thereby adding greatly to the wealth and the strength of the Nation.

HARRIS WEINSTOCK.

¹ See supplementary reports.

² See supplementary report. Appointed commissioner Mar. 17, 1915, to serve the unexpired term of Hon. F. A. Delano, resigned.

REPORT OF COMMISSIONERS WEINSTOCK, BALLARD, AND AISHTON.

We concur in the report prepared by Commissioner Commons, dissenting, however, on the two following points, and supplementing it by certain other findings and recommendations following herewith.

First. We dissent from the recommendation that the secondary boycott should be legalized. We regard the secondary boycott as unjust, inequitable, and vicious, in that it subjects third and innocent parties to injury and, at times, to great loss if not ruin. We are, therefore, as much opposed to it as we are to the blacklist. There have been instances where, for example, a strike would occur on a newspaper. The strikers would demand, for example, that a certain business house advertising in such paper should, despite the fact that it was under contract, withdraw its patronage, and on refusal of the advertiser to violate its contract with the newspaper, it became the victim of boycotts at the hands of the strikers more or less injurious, if not disastrous, in their results to such advertiser. The Supreme Court of the United States has, in our opinion, wisely and justly declared the secondary boycott illegal, and we regard it as an injury to society to legalize a system so vicious.

It has been pointed out that—

* * * the boycott is the chief weapon of modern unionism, and also characteristic generally of its spirit and methods. A discussion of a boycott as a mere withdrawal of patronage is idle and academic. When that is the extent of the boycott in any particular case, the patronage is simply withdrawn, and nothing more is heard about it. From that simple procedure the modern boycott has been developed into a very different thing, and what has become known as the secondary boycott, dragging in third parties to the dispute and penalizing them for patronizing one of the parties to the dispute, has played an important part.

Dealing with this phase of the question, Judge William H. Taft, in an early case (1893), said:

The boycott is a combination of many to cause a loss to one person by coercing others against their will to withdraw from him beneficial business intercourse by threats that unless those others do so, the many will cause serious loss to them.

In the case of *Moore v. The Bricklayers' Union*, Judge William H. Taft says:

The conflict was brought about by the effort of defendants to use plaintiff's right of trade to injure Parker Bros., and, upon failure of this, to use plaintiff's customers' rights of trade to injure the plaintiff. Such effort can not be in the bona fide exercise of trade, is without just cause, and is therefore malicious. The immediate motive of defendants here was to show to the building world what punishment and disaster necessarily follows a defiance of their demands. The remote motive of wishing to better their condition by the power so acquired will not, as we think we have shown, make any legal justification for defendants' acts. We are of the opinion that even if acts of the character and with the intent shown in this case are not actionable when done by individuals, they become so when they are the result of combination, because it is clear that the terrorizing of a community by threats of exclusive dealing in order to deprive one obnoxious member of means of sustenance, will become both dangerous and oppressive.

The Anthracite Coal Strike Commission, in its report in touching upon secondary boycotts, says:

It was attempted to define the boycott by calling the contest between employers and employees a war between capital and labor, and pursuing the analogies of the word, to justify thereby the cruelty and illegality of conduct on the part of those conducting the strike. The analogy is not apt, and the argument founded upon it is fallacious.

There is only one war-making power recognized by our institutions, and that is the Government of the United States and of the States in subordination thereto, when repelling invasion or domestic violence. War between citizens is not to be tolerated, and can not in the proper sense, exist. If attempted it is unlawful, and is to be put down by the sovereign power of the State and Nation. The practices which we are condemning would be outside the pale of civilized warfare. In civilized warfare, women and children, and the defenseless are safe from attack, and a code of honor controls the parties to such warfare, which cries out against the boycott we have in view. Cruel and cowardly are terms not too severe by which to characterize it.

Second. We further dissent from said report in its limitation of public inquiry in labor disputes only to cases where both sides invite such inquiry. We believe that in the public interest there are times when compulsion in labor disputes is thoroughly justified. We feel, with organized labor, that there should be no restriction put upon the right to strike, realizing as we do, that the strike is the only weapon which, in the interest of labor, can be effectively and legally used to aid in bettering its conditions. We feel, also, that there should be no restriction placed upon the employer in his right to declare a lockout in order better to protect what he regards as his interest, and we therefore would not favor any plan that would inflict penalties upon the worker or upon the employer for declaring a strike or lockout.

Where the two sides to a labor controversy are fairly well balanced in strength, the winning side must depend, in the last analysis upon the support of public opinion. Public opinion, therefore, becomes a most important factor in the interest of industrial peace. Such public opinion, however, to be of value, must be enlightened. Under prevailing conditions this is almost impossible. All that the public is now able to get, as a rule, are garbled and ex parte statements, more or less misleading and unreliable, which simply tend to confuse the public mind.

Where strikes and lockouts take place on a large scale, and more especially in connection with public utilities, the public inevitably becomes a third party to the issue, in that it has more at stake than both parties to the dispute combined. For example, if the street railways of a large city are tied up, the loss to the railway companies in the way of revenue, and to the workers in the way of wages, is great, but this loss becomes insignificant compared with the loss inflicted upon the rest of the community, to say nothing of the annoyance, inconvenience, and menace to life and property, which not infrequently occur in such industrial disputes. The public, therefore, as the third party to the issue, is justified in demanding that an investigation take place, and that the facts be ascertained and presented in an impartial spirit to the general public, so that ways and means may be found of adjudicating the dispute or of throwing the influence of a properly informed public opinion on the side which has the right in its favor.

We, therefore, earnestly recommend that in the case of public utilities, the proposed industrial commission shall not only have power to mediate and conciliate, but also, at the request of either side to a dispute, or upon the initiative of the commission itself, should have the power, all voluntary methods having failed, to undertake a compulsory public inquiry when, in the discretion of the commission, public interest demands it; that it be given the fullest powers to summon witnesses, place them under oath, demand books and documents, all with a view of ascertaining the underlying causes of the dispute and the issues involved, to the end of making recommendations that, in the judgment of the board of inquiry, consisting of three members, one to be chosen by each side and the third to be chosen by these two, would be a fair and reasonable settlement of the points in dispute. It being understood, however, that neither side is obliged to accept such recommendations, but may continue to strike or lockout, as the case may be. Meanwhile, however, the public will have ascertained in the most reliable way the issues involved, the facts as they have been found by the board of inquiry, and the basis upon which a fair settlement can be established, thus enabling the public more intelligently to throw its support where it rightfully belongs.

With the two foregoing modifications, we heartily concur in the report prepared by Commissioner Commons. We desire, however, additionally, to report as follows:

We find that the alleged findings of fact and, in a general way, the comments thereon made in the report of the staff of this commission, under the direction of Mr. Basil M. Manly, which has been made a part of the records of this commission, without the indorsement, however, of the commission, so manifestly partisan and unfair that we can not give them our indorsement. What we regard as the desirable recommendations in the report of Mr. Manly are dealt with to our satisfaction in the Commons report, which has our approval.

We find that Mr. Manly's report places practically all the responsibility for the causes of industrial unrest at the doors of one side, forgetting that both sides to the issues are human, and, being human, are guilty of their fullest share of wrongdoing, and are alike responsible in greater or lesser degree, for the causes of industrial unrest.

We are, therefore, prompted, in the interest of fairness and justice, to present herewith some of the additional causes of industrial unrest that, in the course of the investigations and public hearings of the commission, have forced themselves upon our attention.

Despite the fact that we have been appointed to represent, on this commission, the employers of the Nation, we are free to admit that the investigations made by the commission, and the testimony brought forth at our public hearings, have made it plain that employers, some of them, have been guilty of much wrongdoing, and have caused the workers to have their fullest share of grievances against many employers. There has been an abundance of testimony submitted to prove to our satisfaction that some employers have resorted to questionable methods to prevent their workers from organizing in their own self-interest; that they have attempted to defeat democracy by more or less successfully controlling courts and legislatures; that some of them have exploited women and children and unorganized workers; that some have resorted to all sorts of

methods to prevent the enactment of remedial industrial legislation; that some have employed gunmen in strikes, who were disreputable characters, and who assaulted innocent people and committed other crimes most reprehensible in character; that some have paid lower wages than competitive conditions warranted, worked their people long hours and under insanitary and dangerous conditions; that some have exploited prison labor at the expense of free labor; that some have been contract breakers with labor; that some have at times attempted, through the authorities, to suppress free speech and the right of peaceful assembly; and that some have deliberately, for selfish ends, bribed representatives of labor. All these things, we find, tend to produce industrial unrest, with all its consequent and far-reaching ills.

There is, therefore, no gainsaying the fact that labor has had many grievances, and that it is thoroughly justified in organizing and in spreading organization in order better to protect itself against exploitation and oppression.

On the other hand, in justice to employers generally, it must be said that there has been much evidence to show that there is an awakening among the enlightened employers of the Nation, who have taken a deeper personal interest in the welfare of their workers than ever before in industrial history; that such enlightened employers are growing in number and are more and more realizing that, if for no other reason, it is in their own self-interest to seek the welfare of their workers and earnestly to strive to better their conditions. Employers, on their own initiative, have created sick funds and pension funds; have expended vast sums of money to insure greater safety to their workers; have, as compared with conditions of the past, greatly improved their methods of sanitation; have done much to regularize employment; have increased wages; and in every way have endeavored to lighten the burdens of their workers.

While there are many deplorable conditions yet remaining to be rectified, and while the condition of the worker is still far from ideal, we believe that, on the whole, the impartial investigator must find that, in normal times, on the average, the hours of the American worker are the shortest, his wages the highest, his working conditions the most favorable, his standard of living the highest, and his general well-being the best in the world's industrial history.

Industrial Commissioner John B. Lennon, who is also a member of the executive council of the American Federation of Labor, in the absence of official figures has estimated that there are at this time about 20,000,000 wage earners in the United States, and that about 3,250,000 of these are members of various labor unions. In other words, as a liberal approximation, about 16 per cent of the wage earners of America are members of trade unions.

Considering that the American Federation of Labor came into life in 1881, some 34 years ago, and considering the earnest and zealous efforts that have been made by its representatives and the representatives of other labor organizations to agitate, educate, and organize, and considering still further the highly commendable objects professed by organized labor, the membership results are disappointingly small.

One reason given for the comparatively small percentage of unionists in the ranks of labor is the hostility against unionism on the part

of many employers. Organized labor points out that there are many employers' associations that are organized not to deal with, but to fight, unionism, and that this, in many instances, and more especially in the larger industrial enterprises, presents a very serious obstacle for organized labor to meet and to overcome.

Representing as we do on this commission the employers' side, we are as one with the other members of our Federal commission who represent the general public, and also with those representing organized labor, in believing that, under modern industrial conditions, collective bargaining, when fairly and properly conducted, is conducive to the best good of the employer, the worker, and society. We find that there are many enlightened employers who concur in this view, who in the past recognized and dealt with organized labor, but who now refuse to do so, and who, under proper conditions, would willingly continue to engage in collective bargaining. With good cause, in our opinion, however, they place the responsibility for their refusing to do so at the door of organized labor. There is an abundance of available testimony in our records to show that many employers are frightened off from recognizing or dealing with organized labor for fear that to do so means to put their heads in the noose and to invite the probability of seriously injuring, if not ruining, their business.

The prime objection that such employers have to recognizing and dealing with organized labor is the fear of (*a*) sympathetic strikes, (*b*) jurisdictional disputes, (*c*) labor union politics, (*d*) contract breaking, (*e*) restriction of output, (*f*) prohibition of the use of non-union-made tools and materials, (*g*) closed shop, (*h*) contests for supremacy between rival unions, (*i*) acts of violence against non-union workers and the properties of employers, (*j*) apprenticeship rules.

While we have found many sinners among the ranks of the employers, the result of our investigation and inquiries forces upon us the fact that unionists also can not come into court with clean hands; that this is not a case where the saints are all on one side and the sinners all on the other. We find saints and sinners, many of them, on both sides.

The hope of future industrial peace must lie in both sides using their best endeavors to minimize the causes that lead to the growth of sins and sinners on each side of the question.

SYMPATHETIC STRIKES.

Taking up seriatim the objections offered by many employers to recognizing and dealing with organized labor, we come first to that of the sympathetic strike. The employer contends, and we find ourselves in sympathy with his contention, that it is a rank injustice to subject him to a strike of his employees who have absolutely no grievances, to stop work because some other group of workers, possibly at a remote point, have a real or fancied grievance against their own employer, especially when such stoppage of work may not only inflict a very serious loss, but may mean ruin to the enterprise of the innocent employer, thus making it, in violation of all the

equities, a clear case of punishing the many innocent for the one or the few who may be guilty, who were party to the original dispute.

JURISDICTIONAL DISPUTES.

The employer further points out that not only is his business liable to be ruined by the sympathetic strike, but, more especially in the building trades, is he likely to become an innocent victim of jurisdictional disputes for which he is in no wise responsible and over which he has absolutely no control.

Sidney and Beatrice Webb point out that—

It is no exaggeration to say that to the competition between overlapping unions is to be attributed about nine-tenths of the ineffectiveness of the trade-union world.¹

Innumerable instances have occurred where jurisdictional strikes have lasted for months and sometimes for years.²

The elevator constructors had a serious and costly dispute with the machinists in Chicago over the installation of pumps connected with hydraulic elevators. A strike resulted for more than two years, during which most of the elevator men in the city were out of work while members of the machinists and other unions supplied their places with the Otis Elevator Co.²

In 1910 the secretary of the bricklayers said:

Our disputes with the operative plasterers' union during the past year have taken thousands of dollars out of our international treasury for the purpose of protecting our interest. The loss in wages to our members has amounted to at least \$300,000. The loss to our employers has been up in the thousands, also.³

Prof. Commons, in his studies of the New York building trades, comments on the jurisdictional disputes as follows:

Building construction was continuously interrupted, not on account of lock-outs, low wages, or even employment of nonunion men, but on account of fights between the unions. A friendly employer who hired only union men, along with the unfriendly employer, was used as a club to hit the opposing union, and the friendly employer suffered more than the other.³

The Chicago machinery movers caused considerable delay in the construction of the Harris Trust Building, and in a period of less than a year were responsible for no less than 50 separate strikes, during which the work of the employers was delayed.⁴

Jurisdictional disputes waste both labor and capital. They make it impracticable in many cases to use improved appliances and cheaper materials. They are responsible for hesitancy in undertaking and increasing expense in prosecuting buildings, to the detriment of the building industry.⁴

Finally, where the disputes are long continued, they are responsible for that whole train of evil results which follows upon idleness and poverty.⁵

Sidney and Beatrice Webb again point out that in the industries of Tyne-side, within a space of 35 months, there were 35 weeks in which one or the other of the four most important sections of workmen in the staple industry of the district absolutely refused to work. This meant compulsory idleness of tens of thousands of men, the selling out of households, and the semistarvation of whole families totally unconcerned with the disputes, while it left the unions in a state of weakness from which it will take years to recover.⁶

That wise and far-seeing labor leaders keenly appreciate the great wrongs inflicted not only upon the employers, but upon the workers themselves, by virtue of cessation of work in jurisdictional disputes, is emphasized by the following extracts from the report of Mr.

¹ Industrial Democracy, vol. 1, p. 121.

² The Bricklayer and Mason, February, 1911, p. 127.

³ Trade-Unionism and Labor Problems.

⁴ Interview, secretary of Building Employers' Association, Chicago, July, 1912.

⁵ Industrial Democracy, vol. 1, p. 121.

⁶ Ibid., vol. 2, p. 513.

Samuel Gompers, president of the American Federation of Labor, at its convention in 1902:

Beyond doubt, the greatest problem, the danger which above all others is threatening not only the success but the very existence of the American Federation of Labor, is the question of jurisdiction. Unless our affiliated national and international unions radically and soon change their course, we shall, at no distant date, be in the midst of an internecine contest unparalleled in any era of the industrial world, aye, not even when workmen of different trades were arrayed against each other behind barricades over the question of trade against trade. They naturally regard each other with hatred, and treat each other as mortal enemies.

There is scarcely an affiliated organization which is not engaged in a dispute with another organization (and in some cases, with several organizations) upon the question of jurisdiction. It is not an uncommon occurrence for an organization, and several have done so quite recently, to so change their laws and claims to jurisdiction as to cover trades never contemplated by the organizers, officers, or members; never comprehended by their titles, trades of which there is already in existence a national union. And this without a word of advice, counsel, or warning.

I submit that it is untenable and intolerable for an organization to attempt to ride roughshod over and trample under foot rights and jurisdiction of a trade, the jurisdiction of which is already covered by an existing organization. This contention for jurisdiction has grown into such proportions and is fought with such an intensity as to arouse many bitter feuds and trade wars. In many instances employers fairly inclined for organized labor are made innocently to suffer from causes entirely beyond their control.

As proof of the prophetic and far-sighted utterances of President Gompers, it has been pointed out that "in 1911, in Chicago, his grim prophecy was actually fulfilled in the bitter jurisdictional wars fought by rival unions in that city in which paid thugs and gunmen turned the streets of Chicago into a condition of anarchy, and in which, as a mere incident from the union standpoint, millions of dollars of construction work remained idle, with a resultant loss to owners, contractors, and the business interest of the city beyond possibility of calculation."

We ask, what sane or thoughtful employer would willingly put his head in a noose such as this by recognizing and dealing with unions, and thus invite possible ruin?

LABOR UNION POLITICS.

The third objection of employers to recognizing and dealing with organized labor is the risk they run, especially in the building trades, where power to declare a strike is concentrated in the hands of a business agent, of finding themselves at the mercy of either a corrupt business agent or one who, for the sake of union politics, is endeavoring, in order to perpetuate himself in office, to make capital at the expense of the innocent employer by making unwarranted and unreasonable demands against the employer.

CONTRACT BREAKING.

The fourth reason offered by the employers for refusing to recognize or to deal with organized labor, is its increasing unreliability in keeping trade agreements. To give one case in point, our record gives the story in undisputed statement published in the United Mine Workers' Journal, which is the official organ of the United Mine Workers of America, written by Mr. W. O. Smith, ex-chairman of the executive committee of the Kentucky District of United

Mine Workers of America, in which Mr. Smith, among other things, says:

Because of the indifference of the conservative members of our unions, and the activity of the radical element which is responsible for the greatest menace which has ever threatened the United Mine Workers of America, the local strike, during the past two or three years the international, as well as the district and subdistrict officials, have been confronted with many perplexing problems, some of which seem to threaten the very life of the organization. But I believe I am safe in saying that no problem has given them so much concern as the problem of local strikes in violation of agreements.

Thousands of dollars are expended every year in an effort to organize the 250,000 nonunion miners in the United States, while hundreds of our members go on strike almost every day in absolute, unexcusable violation of existing agreements.¹

This criticism comes not from an employer, but from an ardent, earnest unionist, in high standing in his organization.

Corroborating the statement of Mr. Smith, comes a statement published in *Coal Age* of December 20, 1913, issued by the Association of Bituminous Coal Operators of Central Pennsylvania, addressed to Mr. Patrick Gilday, president of District No. 2, U. M. W. of A., Morrisville mines, Pennsylvania, dated Philadelphia, December 12, 1913, in which, among other things, the following appears:

Whereas, Rules 12 and 13 of said agreement provide, "that should differences arise between the operators and mine workers as to the meaning of the provisions of this agreement or about matters not specifically mentioned in this agreement, there shall be no suspension of work on account of such difference, but an earnest effort be made to settle such differences immediately." Whereas, notwithstanding the fact that Rule 15 provides the right to hire and discharge, the management of the mine and the direction of the working forces are vested exclusively in the operator, the United Mine Workers of America have absolutely disregarded this rule, in that they have at numerous times served notices on substantially every operator belonging to our association, that unless all the employees working for such operators should become members of the union on or before certain dates mentioned in said notices, that they, the Mine Workers, would close or shut down the operators' respective mines, and in many instances did close the mines for this reason, and refused to return to work unless such nonunion employees were discharged. This conduct is in direct violation of the contract, and specifically interferes with and abridges the right of the operator to hire and discharge; of the management of the mine, and of the direction of the working forces; this conduct in violation of contract on the part of the Mine Workers, as well as that mentioned in the preceding paragraph, has resulted in more than one hundred strikes during the life of our scale agreement.²

Numerous other illustrations could be given from the records of the commission, showing that there are other instances where unions did not observe their contracts, tending to make, in the minds of many employers, a character for all unionism, and thus increasing their hesitancy in recognizing and dealing with unions.

RESTRICTION OF OUTPUT.

Not least among the reasons given by fair-minded employers for refusing to recognize or deal with labor unions, is the fact that many unions stand for a limited output, thus making among their workers for the dead level, and thereby making it impossible for the union employer successfully to compete with the nonunion employer, who is not faced with such handicap.

¹ New York hearings, U. S. Commission on Industrial Relations, pp. 2750-2751.

² New York hearings, U. S. Commission on Industrial Relations, pp. 2061-2062.

British industrial conditions are cursed with the practice of limited output, as compared with the absence of this practice in industrial Germany. As a consequence, Germany, in time of peace, has industrially outrun Great Britain by leaps and bounds.

The British unionist, by practicing limited output, has thus played directly into the hands of his keenest industrial competitor, the German.

The records of the commission also show that organized labor, almost as a unit, is very strongly opposed to the introduction in industry of what has become known as scientific management, or efficiency methods. In relation to this phase of the problem, we find ourselves as one with the statement made and the opinions expressed by Mr. Louis D. Brandeis before the commission at Washington, in April, 1914, who, when invited to express his opinion on the question of efficiency standards, scientific management, and labor, among other things, said:

My special interest in this subject arises from the conviction that, in the first place, workmen, and in the second place, members of the community generally, can attain the ideals of our American democracy only through an immediate increase and perhaps a constant increase, in the productivity of man. * * * Our ideals could not be attained unless we succeed in greatly increasing the productivity of man. * * * The progress that we have made in improving the conditions of the workingman during the last century, and particularly during the last 50 years, has been largely due to the fact that intervention or the introduction of machinery has gone so far in increasing the productivity of the individual man. With the advent of the new science of management has come the next great opportunity of increasing labor's share in the production, and it seems to me, therefore, of the utmost importance, not only that the science should be developed and should be applied as far as possible, but that it should be applied in cooperation with the representatives of organized labor, in order that labor may now, in this new movement, get its proper share.

I take it that the whole of this science of management is nothing more than an organized effort, pursued intensively, to eliminate waste. * * * It is in the process of eliminating waste and increasing the productivity of man, to adopt those methods which will insure the social and industrial essentials, fairness in development, fairness in the distribution of the profits, and the encouragement to the workingman which can not come without fairness.

I take it that in order to accomplish this result, it is absolutely essential that the unions should be represented in the process. * * * When labor is given such a representation, I am unable to find anything in scientific management which is not strictly in accord with the interests of labor, because it is nothing more than fair, through the application of these methods which have been pursued in other branches of science, to find out the best and the most effective way of accomplishing the result. It is not making men work harder—the very effort of it is to make them work less hard, to accomplish more by what they do, and to eliminate all unnecessary motion, to give special effort and special assistance to those who, at the time of the commencement of their work, are mostly in need of the assistance because they are less competent.

* * * As I view the problem, it is only one of making the employer recognize the necessity of the participation of representatives of labor in the introduction and carrying forward of the work, and on the other hand, bringing to the workingman and the representatives of organized labor, the recognition of the fact that there is nothing in scientific management itself which is inimical to the interests of the workingman, but merely perhaps the practices of certain individuals, of certain employers or concerns who have engaged in it.

I feel that this presents a very good opportunity for organized labor. It seems to me absolutely clear, as scientific management rests upon the fundamental principles of advance in man's productivity, of determining what the best way was of doing a thing, instead of the poor way, of a complete coordination and organization of the various departments of business, that the introduction of scientific management in our businesses was certain to come; that

those who oppose the introduction altogether are undertaking a perfectly impossible task; and that if organized labor took the position of absolute opposition, instead of taking the position of insisting upon their proper part in the introduction of this system, and the conduct of the business under it, organized labor would lose its greatest opportunity, and would be defeating the very purpose for which it exists.

On being asked the question what, in his opinion, would be the status of unionism in the event of scientific management becoming a common industrial condition, Mr. Brandeis said:

I think there would be a great deal left for unionism to do, and do not think the time will come when there will not be, as long as there is a wage system in existence. * * * I do not feel that we have reached the limit of the shorter day, certainly not in some employments, nor do I think we have reached the limit of the higher wage; certainly we have not reached the limit of the best conditions of employment in many industries.

All of these subjects are subjects which must be taken up, and should be taken up by the representatives of the men and women who are particularly interested. There will be work for unions to do as long as there is a wage system.

Mr. Brandeis further stated that he saw no menace to unionism in scientific management, and that he favored labor having a voice in determining all the factors involved in scientific management.

In answer to the question if he thought the fears groundless on the part of organized labor in looking upon scientific management as a menace to unionism, he answered, saying:

Yes; groundless except for this—I think, for instance, that the existence of the system of scientific management, unless the unions choose to cooperate with the effort to install it, may menace unionism, because the most efficient and advanced employers may adopt it, whether the unions like it or not, and in that way these establishments may become successful, and be so buttressed by their success as to be able to exclude unions from their business. That is the menace, if they do not take part, but if they cooperate it seems to me it simply advances unionism.

Mr. Brandeis confirmed the thought that if unionism is wise it will make the most of its opportunity by enlisting its cooperation in the movement, and will endeavor to bring scientific management to its highest possibility at the earliest day, in order that it may better share the increased surplus created by such scientific management, and that for unions to work against it is in the nature of a colossal error. The testimony of Miss Ida Tarbell on this point was in full accord with that of Mr. Brandeis.

PROHIBITION OF USE OF NONUNION-MADE TOOLS AND MATERIAL.

The sixth reason offered by employers for refusing to recognize or to deal with organized labor is that when they do so they are often not permitted to use nonunion-made tools or materials, thus placing upon themselves a burden and a hardship from which nonunion employers are free, and thus also laying themselves liable to get into all sorts of controversies with the union, which are vexatious, annoying, time-losing, and, frequently, most costly, as they sometimes lead to grave and serious strikes.

CLOSED SHOP.

The seventh reason why many employers refuse to recognize or to deal with organized labor (and among these may be mentioned the employers of large bodies of workers who have previously had trade agreements with organized labor) is the matter of the closed shop.

Many such employers are quite willing to recognize and to deal with unions upon a tacit or written open-shop agreement, but they have no confidence, based on their previous experience, that an open-shop agreement will be respected by the unions. Such employers labor under the fear that, despite an open-shop agreement or understanding, the union, at its first opportunity, will force them to compel the nonunion worker to join the union. Employers such as these are unwilling to place themselves in the position where the union can control them despite an open-shop agreement or understanding and, so to speak, put a pistol to their heads and command them in turn to command a nonunion worker on pain of dismissal to join the union. Such employers feel that, having an open-shop agreement or understanding, if for any reason a worker does not choose to join the union, they as employers should no more compel him to do so than they would compel him to join any particular fraternal society or religious body. They feel that if they are working under an open-shop agreement or understanding and such nonunion worker is capable, efficient, and has rendered long and faithful service, that they are doing him and themselves a great injustice either to force him into a union or to discharge him because he will not join a union.

Where an employer enters into an agreement with a union which does not stipulate that only union men shall be employed but leaves the employer free to employ exclusively union men or some union and some nonunion men as he may prefer, so long as he maintains for all men union conditions, that in such an event the union has no right to demand that the nonunionist should be compelled by the employer to join the union or a strike will follow. For the union, under such conditions, to strike, as it has done, notably in the Pennsylvania coal fields, and as pointed out also by W. O. Smith, ex-chairman of the executive committee of the Kentucky district of the United Mine Workers of America, whose statements have been quoted herein, is a violation, on the part of the union, of its contract.

It may be held that unionists working under an open-shop agreement or understanding always reserve to themselves the right, for any reason or for no reason, to cease to work alongside of nonunion men, and that they further reserve the right to determine the psychological moment at which it is in their interest to cease work or to go on a strike because they will not work alongside of nonunion men. It is the fear of the likelihood of their doing this that frightens off many employers from recognizing or dealing with organized labor. They feel that even when they are operating under an open-shop agreement or understanding which does not deny them the right to employ nonunion men so long as they work under union conditions, they are working with a sword suspended over their heads by a slender thread, which may break at any moment, and are liable to have a strike on their hands at the most critical time, which may spell ruin for their business. Employers, as a rule, do not deem it a good business policy to invite such risks.

An impressive example of this policy on the part of organized labor was brought out in the testimony taken by the commission at Lead, S. Dak. Supt. Grier, of the Homestake Mining Co., Lead, S. Dak., at the hearing held by the commission at that point in August, 1914, stated that he had recognized and dealt with the Lead City Miners'

Union from 1877 to 1909, with the understanding that they were at liberty to employ union or nonunion men as they preferred. Late in October, 1909, a resolution was published in the daily papers that on and after the 25th of November, 1909, members of the federation would not work with those working for the Homestake Mining Co. who failed and neglected to become members of the union in good standing; and in consequence, on the 25th of November, the mine was closed down, and from that day on the company has not recognized nor dealt with organized labor.

We are, however, of the opinion that where an employer enters into an agreement with a union which stipulates that only union men shall be employed, a thing which he has both a moral and a legal right to do, the nonunion worker, in that event, can have no more reason to find fault with the employer in declining to employ him than a certain manufacturer would have if the employer, for reasons satisfactory to himself, should confine his purchases to the product of some other manufacturer.

CONTESTS FOR SUPREMACY BETWEEN RIVAL UNIONS.

Testimony has been given before this commission indicating, in more than one instance, that contests between rival unions, or factions of the same union, have led to strikes causing industrial unrest from which the worker as well as the employer, has suffered harm and loss.

ACTS OF VIOLENCE AGAINST NONUNION WORKERS AND THE PROPERTIES OF EMPLOYERS.

The ninth objection raised on the part of the employers against unionism, which has been substantiated abundantly by investigation and by testimony taken by the commission, is the resort on the part of unionists to violence in labor troubles, and to the fact that unionists condone such violence when committed in the alleged interest of labor.

The most notable case, of course, in modern industrial history, is that of the structural iron workers, which resulted in the plea of guilty on the part of the McNamara brothers, for the blowing up of the Los Angeles Times Building, killing over 20 innocent people, and which further resulted in Frank Ryan, the president of the Structural Iron Workers' National Union, and a group of other labor union officials, being convicted and sentenced to prison.

As a matter of fact, the bringing into life of this United States Commission on Industrial Relations was due primarily to the long series of crimes committed at the instance of the structural iron workers' union, which culminated in the blowing up of the Los Angeles Times Building, with its attendant loss of life of innocent citizens, and which aroused a state of public sentiment demanding that an investigation be made by an impartial Federal body, to inquire into the underlying causes of industrial unrest, the existence of which seemed to be evidenced by the violent activities on the part of labor in various parts of the country.

Vincent St. John, secretary of the Industrial Workers of the World, in his testimony before the Commission on Industrial Rela-

tions at a public hearing in New York, said that he believed in violence when it was necessary to win. He said that if the destruction of property seemed necessary to bring results, then he believed in the destruction of property.

A. Johannsen, of California, State organizer for the building trades of California, and general organizer for the United Brotherhood of Carpenters, in his testimony before the United States Commission on Industrial Relations at Washington in May, 1915, in speaking of the reelection of Frank Ryan, president of the National Structural Iron Workers' Union, among other things thanked the Lord that the union had the courage to reelect him president after he had been convicted as a participant in the dynamiting crimes of the structural iron workers. He further expressed the hope that it was true that the convicted dynamiters, after being reelected to office by the iron workers, were met by a procession of applause at Fort Leavenworth while on their way to prison, and that President Ryan performed his official duties while there, and rendered his official reports as president of a union of 10,000 members and a part of the American Federation of Labor.

In contradistinction to the opinion of Mr. Johannsen, to the effect that he thanked the Lord that the union had the courage to reelect Frank Ryan president after he had been convicted as a participant in the dynamiting crimes of the structural iron workers, we have the opinion of Dr. Charles W. Eliot, president emeritus of Harvard University, who, in his testimony before the United States Commission on Industrial Relations at New York, January 29, 1915, in referring to this very instance, said, in answer to the question as to how he regarded the action of the structural iron workers' union in reelecting Frank Ryan president after his conviction of crime, "As a serious moral offense against the community as a whole."¹

Speaking about respecting court labor injunctions, Witness Johannsen said:

I don't think the power of an injunction goes much beyond the courage of those who are enjoined. I think that if a person is convinced in his own mind and his own feelings that his case is just, that his demands for an increase of wages, or whatever the fight may be—if you think and feel you are right, why, then go ahead. Never mind about those pieces of paper.²

On being asked whether he (Johannsen) believed that Frank Ryan, president of the Structural Iron Workers' National Union, and his associates, were innocent men railroaded to prison, he said that he did, and that he was satisfied they never committed any crime against labor or a better society, and were therefore unjustly convicted. This was his attitude, despite his attention having been called to the opinion and decision rendered by the circuit court of appeals, including Judges Baker, Seaman, and Kohlsaat, against whose integrity and fairness no whisper had ever been heard, and who seemingly went into the evidence in the dynamiting cases most exhaustively and carefully, and who, among other things, in their decision, said—

The facts thus recited, as proven by the Government on the trial, may be mentioned in part as follows: Almost 100 explosions thus occurred, damaging and destroying buildings and bridges in process of erection where the work

¹ New York hearings, U. S. Commission on Industrial Relations, p. 1907.

² Washington hearings, May, 1915, U. S. Commission on Industrial Relations, p. 958.

was being done by open-shop concerns, and no explosions took place in connection with work of a similar character, where the work was done by closed-shop concerns. * * * In connection with this work of destruction, dynamite and nitroglycerine was purchased and stolen, and various storage places arranged to conveniently store such explosives which were to be used in the destruction of property in the various States referred to. * * * Large quantities of dynamite and nitroglycerine were at various times stored in the vaults of the association at Indianapolis, and also in the basement of the building. * * * Four explosions occurred in one night at the same hour in Indianapolis, and explosions were planned to take place on the same night, two hours apart, at Omaha, Nebr., and Columbus, Ind., and the explosions so planned did occur on the same night, at about the same time, instead of two hours apart, owing to the fact that one clock was defective. * * * All the dynamite and nitroglycerine * * * including the expenses incident to the stealing of the dynamite, were paid out of the funds of the international association, and these funds were drawn from the association upon checks signed by the secretary-treasurer, John J. McNamara, and the president, Frank M. Ryan, plaintiff in error.

The written correspondence on the part of many of the plaintiffs in error * * * furnish manifold evidence not only of understanding between the correspondents of the purposes of the primary conspiracy, but many thereof convey information or direction for the use of the explosives, while others advise of the destruction which has occurred, and each points unerringly not only to the understanding that the agency therein was that of the conspirators, but as well to the necessary steps in its performance of transporting the explosives held for such use. This line of evidence clearly tends to prove, and may well be deemed convincing of the fact on the part of many, if not all, of the correspondents.

Plaintiff Frank M. Ryan was president of the association and of its executive board, and was active manager and leader of the contest, and policies carried on throughout the years of the strike and destructive explosions in evidence. Letters written and received by him at various stages of the contest clearly tend to prove his familiarity with and management of the long course of destroying open-shop structures, however guarded in expression. He was at the headquarters of the association for the supervision of operations periodically, usually two or three days each month, uniformly attended the meetings there of the executive board, and made frequent visits to the field of activities. * * * He signed all of the checks in evidence for payments for expenditures for purchase, storage, and conveyance of explosives. * * * Many other letters in evidence, both from and to him, however disguised in terms, may well authorize an inference of his complete understanding of, and complicity for, the explosions, both in plans and execution.¹

Masses of testimony were filed with the commission to prove that organized labor at times resorted to a policy of lawlessness. Among other documents may be cited a magazine under the title of *A Policy of Lawlessness*, a partial record of riot, assault, murder, and intimidation, occurring in strikes of the iron molders' union, during 1904, 1905, 1906, 1907, published by the National Founders' Association, in which are given, as a partial list taken from court records, a great number of instances of violence on the part of labor unionists in labor disputes; and also a document published as a report, submitted by the committee on labor disputes of the Cleveland Chamber of Commerce, entitled "*Violence in Labor Disputes*," giving hundreds of instances where unionists had resorted to violence in labor troubles in that community alone.

Mr. Luke Grant, special investigator for the United States Commission on Industrial Relations, in his report to the commission on

¹ Washington hearings, May, 1915, U. S. Commission on Industrial Relations, pp. 1004-1013.

the National Erectors' Association and the International Association of Bridge and Structural Iron Workers, says:

Do they [the unions] believe in violence? They did not destroy property and they don't know who did. They probably adopted resolutions denouncing the unknown perpetrators, and offering a reward for their arrest and conviction. The Western Federation of Miners, in convention, offered a reward for the arrest of the men who blew up the Independence depot in June, 1904, killing 14 men. Harry Orchard afterwards confessed that he and Steve Adams did it, acting as agents for the officers of the union.

In this way do union men collectively approve of violence, that few if any of them would individually permit (p. 148).

Referring to the industrial war between the National Erectors' Association and the structural iron workers' union, Mr. Grant continues to say:

When the hopelessness of the situation became apparent to the union officials, resort was made to the destruction of property. Diplomacy was out of the question, so dynamite was tried (p. 150).

The report of Luke Grant brings out the fact that the structural iron workers had no grievances against their employers in the matter of wages, hours, or working conditions. The only question at issue was that of the closed shop. To enforce the closed shop, the structural iron workers seemed to feel themselves justified in dynamiting over 100 properties and destroying many innocent lives.

Police Commissioner Arthur Woods, of the city of New York, in his testimony before the United States Commission on Industrial Relations in May, 1915, at Washington, D. C., speaking of violence by labor unions, among other things, said:

The result of our investigation shows a course of procedure like this: There would be a strike and the strikers would retain some gunmen to do whatever forcible or violent work they needed. The employer, to meet this violence, would in a comparatively small percentage of cases, and not as many cases as the gunmen were employed on the other side, hire a private detective agency. The function that the gunmen were to perform was to intimidate the workers that were hired to take the place of the strikers. * * * There were three indictments for murder in the first degree.

The question was asked Police Commissioner Woods in how far his investigations had warranted the statement that appeared in the New York Herald of May 14, 1915, reading as follows:

Several of the indictments mentioned assault upon members of the union, and in this connection District Attorney Perkins said last night that the reign of lawlessness was caused by union leaders who wished to perpetuate themselves in power, who hired assailants to assault contenders in their own unions for their places, and who used their union offices to extort blackmail under threats from employers. Seven men are indicted for assault in a riot for control of the union. Four men are indicted for hiring Dopey Benny's men to go to a nonunion factory and rough-house the employees as they left, and wreck the plant. A dozen workers were wounded in that fight.

Six union men are accused of extortion and assault in using violence to collect a fine of \$100 upon an employer. Four others are accused of hiring the Dopey Benny band to shoot up a nonunion factory. Many shops were fired. The factory suffered a damage of \$1,000 and several persons were injured. Other indictments mentioned cases where the band was employed by union leaders to attack nonunion workers, to wreck factories, and even to assault nonunion men who opposed the leaders (pp. 964-5).

To all of the foregoing, Police Commissioner Woods replied, "That is the general line of things that we found."

One of the ablest and clearest-headed exponents of the cause of labor that testified before this commission was Morris Hillquit, of New York. In speaking of violence in labor troubles, he is quoted as saying,¹ that the resort to violence and lawbreaking was "ethically unjustifiable and tactically suicidal." Mr. Hillquit pointed out that wherever any group or section of the labor movement "has embarked upon a policy of 'breaking the law' or using 'any weapon which will win a fight,' whether such policy was styled 'terrorism,' 'propaganda' of the deed, 'direct action,' 'sabotage,' or 'anarchism,' it has invariably served to destroy the movement by attracting to it professional criminals, infesting it with spies, leading the workers to needless and senseless slaughter, and ultimately engendering a spirit of disgust and reaction."

Robert Hunter, commenting on the foregoing statement made by Morris Hillquit, says (p. viii):

It will, I think, be clear to the reader that the history of the labor movement during the last half century fully sustains Mr. Hillquit's position.

APPRENTICESHIP RULES.

The question of apprenticeships has led to much industrial strife and consequent industrial unrest, where unions have arbitrarily determined the number of apprentices that the employer may take on.

Where this practice has prevailed the union employer has, in competition with the nonunion employer, been seriously handicapped. The remedy for this evil lies obviously in a joint agreement under the direction of the proposed State industrial commissions, in which each side has an equal voice in determining the proper quota of apprentices to be employed.

In conclusion, it is our desire to point out that organized labor is chargeable with its fullest share of creating causes of industrial unrest, because of its sympathetic strikes, its jurisdictional disputes, its labor union politics, its contract breaking, its resort to violence in time of trouble, its policy of limited output, and its closed shop policy. There is an abundance of evidence in the records of the commission to show that organized labor is also guilty of intimidating courts, more especially the lower criminal courts, to deal lightly with labor offenders charged with criminal assaults in labor troubles; and that some judges, more especially in the lower courts, toady to organized labor for vote-getting purposes, and dismiss union labor men guilty of lawbreaking, or impose on them nominal penalties out of all proportion to the crimes committed.

These various policies have brought about their fullest share among the workers, to say nothing of the injury inflicted on employers and on society, of poverty, suffering, wretchedness, misery, discontent, and crime. Organized labor will never come into its own, and will indefinitely postpone the day when its many commendable objects will be achieved in the broadest sense, until it will cut out of its program sympathetic strikes, until it can prevent cessation of work in jurisdictional disputes, until it can more successfully prevent labor union politics, until it can teach many in its rank and file to regard more sacredly their trade agreements, until it can penalize its members for

¹ Robert Hunter, *Violence and the Labor Movement*, p. viii.

resorting to violence in labor disputes, and until it can make it a labor union offense to limit output.

Organized labor may ask, "If we cut out the evil policies complained of from our program, what offensive and defensive weapons will be left us with which to protect ourselves against the unfair employer?"

The answer is that when labor is effectively organized it has two most powerful weapons at its command that the employer, as a rule, dreads and fears because of the great damage these weapons can inflict on him, namely, the strike and the primary boycott, both of which are within the moral and legal rights of the worker to use.

Generally speaking, the evils complained of have been eliminated from the program of the railway brotherhoods. As a consequence, railway managers do not hesitate to recognize and to deal with the railway unions, to their mutual advantage and satisfaction, with the result that collective bargaining has become the common condition in the railway world. Railway strikes and lockouts have now become most infrequent, and industrial unrest due to these causes in this sphere of activity has become greatly minimized.

If these evils are eliminated by organized labor from its program, much will have been done to stimulate collective bargaining and to minimize the existing causes of industrial unrest. The remedies for all these evils do not lie with the employer; they rest wholly and solely with unionists. The responsibility for the growth of these evils, in our opinion, rests primarily with unionists who neglect their union duties and who are as unmindful of their duties as union men as are many voters of their civic duty who remain at home on election day.

We have faith in the honesty of purpose, in the fairness of spirit, and in the law-abiding character of the American worker, and we do not believe that the rank and file of American wage earners are in favor of many of the practices of some unions which have subjected unionism to so much severe, but just, criticism. We believe it is the duty of each unionist regularly to attend the meetings of his union in order that democracy shall prevail in trade-unions instead of an autocracy or despotism, which inevitably follows where the best membership fails to attend union meetings and thus permits the affairs of the organization to get into the hands of incompetent, ill-judging, or dishonest officials, who, for their selfish ends, abuse the power and authority vested in them.

Wherever there are found honest, high-minded, clear-headed labor leaders—and in the course of our investigations and hearings we have come into close personal touch with many such as these, who have commanded our esteem and respect—it will be found that, as a rule, they represent unions where the better membership takes a lively and active interest in the welfare of the association, and regards it as a sacred duty to regularly attend its meetings.

We say frankly that if we were wage earners we would be unionists, and as unionists we should feel the keen responsibility of giving the same attention to our trade-union duties as to our civic duties.

The ideal day in the industrial world will be reached when all labor disputes will be settled as a result of reason and not as a result of force. This ideal day can be hastened if the employers, on the

one hand, will earnestly strive to place themselves in the position of the worker and look at the conditions not only through the eye of the employer but through the eye of the worker; and if the worker will strive to place himself in the position of the employer, and look at the conditions not only through the eye of the worker but through the eye of the employer.

This, of course, means the strongest kind of organization on both sides. It means that employers must drive out of the ranks of their associations the law breaker, the labor-contract breaker, and the exploiter of labor. It also means that, in the interests of fairness, every board of directors of an industrial enterprise should have within its organization a committee for the special purpose of keeping the board of directors advised as to the condition of their workers. And it finally means that trade-unions must, in order to minimize the causes of industrial unrest, among other things remove the weak spots in unionism set forth herein, thereby hastening the day when employers will no longer fear to recognize and deal with unions, and when collective bargaining shall thus become the common condition.

Finally, we feel that employers, individually and through their associations, in common with thoughtful representatives of labor, should give their fullest share of thought and lend their heartiest cooperation in aiding to solve, through constructive legislation and other ways, the great problems of vocational education, continuation schools, woman and child labor, apprenticeship, hours of labor, housing, sickness insurance, workmen's compensation, safety measures, old-age pensions, and unemployment. The hope is therefore expressed that employers will strive to work with rather than against intelligent labor representatives in aiding, through these various movements, to lessen industrial unrest and to still further improve the condition of wage earners and their dependents.

HARRIS WEINSTOCK.

S. THRUSTON BALLARD.

RICHARD H. AISHTON.¹

¹ Appointed commissioner Mar. 17, 1915, to serve unexpired term of Hon. F. A. Delano, resigned.

SUPPLEMENTAL STATEMENT OF COMMISSIONER S. THRUSTON
BALLARD.

The law creating the United States Commission on Industrial Relations, in addition to other things, says: "The commission shall seek to discover the underlying causes of dissatisfaction in the industrial situation and report its conclusions thereon."

The causes of industrial unrest may be put under five main groups:

First. Low wages.

Second. Unemployment, through seasonal occupations, periods of depression, accidents, and sickness.

Third. The development of large industries.

Fourth. Long working hours and insanitary conditions.

Fifth. Unsatisfactory rural conditions.

I will analyze each of these groups separately.

First. Low wages, with all the attendant evils, I consider the prime cause for industrial unrest.

One of the chief factors in wage depression is undoubtedly the encouraged, stimulated, and probably assisted immigration which has brought to our shores millions of unskilled workers in the last few years. These immigrants, coming from those countries where vastly lower wage rates prevail, develop in America a wage competition of which the employer naturally takes advantage.

The European war will probably relieve this immigration situation for the next few years, but it is a question to which our Government must give serious consideration in the near future.

Inefficiency of the unskilled worker is also a contributory cause of low wages. The average applicant for work is irresponsible and untrained.

With all our vaunted free-school system, our industrial education is deplorable. In our large cities they are beginning to consider the question seriously, but our rural schools are lamentably deficient. This inefficiency, which tends to lower the whole standard, can be corrected only through improved educational facilities.

Government assistance should be given to aid in the establishment of vocational, trade, and continuation schools as a part of our public-school system.

The gravitation of industries into large units has caused the skilled worker to be supplanted by the unskilled, who becomes merely a cog in the wheel of the great machine, performing the monotonous duties that anyone could easily do after a few weeks' practice.

The wages of the unskilled laborer are so pitifully small that it is almost impossible for him to maintain a family, even with the most rigid economy.

I suggest as the only remedy for low wages, due to these conditions, the enactment of a national minimum wage law.

Second. Under the second cause of industrial unrest—unemployment—we have seasonal occupations, as, for example, ice cutting and logging in winter, harvesting and fruit-picking in summer.

This problem will always be with us, and should be dealt with through an efficient system of national employment agencies, to be administered by the Federal Government.

Private employment agencies have proved inadequate; have even in many cases been used to exploit the worker. I therefore strongly recommend that all employment agencies be managed by the Government.

We have also unemployment due to periods of depression. The Federal employment agencies would take care of these cases, bringing, when possible, the man and the job together, but in periods of long depression, when no work is to be found, Government, State, and municipal work, which had been held in reserve for this purpose, should then be provided.

Should all these resources be exhausted and there still remain unemployed workers, there should be Government concentration camps where work with a small wage would be provided, supplemented by agricultural and industrial training.

The fear of unemployment because of accident or illness fosters a feeling of discontent which tends to cause industrial unrest.

Workmen's compensation laws and sickness insurance, with proper restrictions, would be the proper correctives here.

Workmen's compensation laws thus far developed protect the man only when accident occurs during working hours, and this is paid for entirely by the employer. If an accident occurs causing injury to a man just before entering his work place, the consequent loss to his family is just as great as though he had been hurt five minutes later within the factory walls, and yet he receives nothing.

I therefore recommend that the workmen's compensation law should provide insurance against accident wherever and whenever caused. This insurance, however, should be paid by the man himself, his employer, and the Government jointly. The same idea should apply also to sickness insurance.

The worker himself should feel these responsibilities and should always share the expense of such insurance.

Third. We have, as the third cause for industrial unrest, the development of large industries with their absentee ownership. Large business, properly controlled, is an economic benefit, but the very size makes coordination between the employers and workers most difficult. There is no personal contact, hence a lack of sympathy and understanding.

Where a few cents per day in the wage of the individual workman means hundreds of thousands of dollars annually to the business, and where there are so many units that one foreman can be pitted against another to maintain the cost of production at the lowest possible point, the natural tendency is to depress the wage.

As to the remedy, I would suggest that all corporations doing interstate business be required to take out a national charter that will entail certain responsibilities and possibly grant certain immunities from State control.

This charter should not allow overcapitalization. Each board of directors, in addition to its other committees, should have a labor

committee whose duty it should be to become thoroughly acquainted with the labor conditions of the business, and make regular reports thereon to the board. These reports should be published with the financial and other reports, and thus give the stockholders a thorough understanding of the business.

Fourth. Long working hours and insanitary conditions are additional factors in the problem of industrial unrest. Nothing affects the man's physical well-being, and consequently his earning power, more than these.

The remedy will be found in publicity and legislation, with factory inspection by competent Government officers.

Personal experience for a number of years convinces me that in continuous occupation, workmen will do more work and better work on an 8-hour basis than on 12, and that one day in seven for rest must be allowed if the man is to develop the fullest degree of efficiency.

I therefore favor a national eight-hour law for continuous labor.

Sanitary conditions of work I have found to be a paying proposition to the employer, as well as just and beneficial to the worker.

Fifth. With regard to unsatisfactory rural conditions, I view with real concern the fact that our small landowners are becoming tenants, while the small farms are passing into the hands of a few.

Everything possible should be done to aid and encourage our farmers; the United States Government should adopt a plan for the scientific distribution of our agricultural products, and for a rural-credit system, as it is practiced to-day in some foreign countries.

Unsatisfactory rural conditions which make it difficult for the small farmer to earn a decent livelihood for his family cause many poorly equipped young men and women to flock to the cities. As a rule, they are thoroughly inefficient and lamentably ignorant of the temptations of city life, and are rarely able to earn a living wage.

Life on the farm should be made sufficiently attractive and lucrative to induce these boys and girls to remain there. This can be done only through our rural schools, which are now most inadequate.

The education of country children must fit them for country life. No love of the beautiful, no patriotic gratitude to his country for his education can be felt by the child who spends weary months in uncomfortable hovels, where he receives impractical and frequently useless instruction.

Our Government should aid the States in establishing comfortable rural schools, with longer terms and with better-paid and better-equipped teachers.

In every rural school there should be departments of household arts—that is, cooking, sewing, and millinery—and manual training and agriculture. These schools should be open for agricultural instruction throughout the summer—in fact, each one should become an experiment station for the neighborhood. The schoolhouse should be the social center—the meeting ground for instruction and social pleasures.

In order to satisfactorily carry out the suggestions contained in this report, it would be necessary to have a nonpartisan commission in charge of industrial questions, as suggested by the majority report of this commission.

This would require large additional revenue, which must be derived by some form of taxation.

The fairest of all taxes are the income and inheritance taxes. This question, however, must be carefully studied and weighed, since the tax is paid by one class while the benefits are largely enjoyed by another.

Care should be taken that it does not become confiscatory, and thus stifle individual incentive and effort.

In addition, I believe that every individual should pay his proportion, no matter how small it may be. It will inspire in him a feeling of citizenship and make him an integral part of our Nation.

S. THRUSTON BALLARD.

III

**Report of Commissioner John B. Lennon
on Industrial Education**

SIGNED BY

**Commissioners Lennon, O'Connell, Garretson,
Ballard, and Walsh**

REPORT OF COMMISSIONER JOHN B. LENNON ON INDUSTRIAL EDUCATION.

The Commission on Industrial Relations gave careful study and investigation to the subject of industrial or vocational education. We found the general subject of education, whether academic, cultural or industrial, so exceedingly important and interesting to all classes of citizens as to warrant a brief statement covering especially the subject of the pressing need for industrial education and the bearing that such education would have upon industrial unrest.

The terms "vocational" or "industrial" education are used to indicate the training given in many varieties of schools and by many different modes of teaching. Our attention has been almost entirely confined to a study of that kind of education which has to do with the preparation of boys and girls for useful employment in industry, particularly as applied to mechanical and agricultural employment.

DEMAND FOR INDUSTRIAL EDUCATION.

The great importance of this subject appears to be fairly well appreciated by every class of our citizenship, trade-unions, employers' organizations, educators, merchants, legislators, etc. The universal interest in this subject warrants the conclusion that its proper solution is of paramount importance to the welfare of the Nation, in order to establish that kind of education that will enable the boys and girls of the United States to enter upon their industrial life properly equipped to make their lives a success. Our attention has been forcibly called to the fact that the great mass of the wageworkers are without any accumulated means. Their children are therefore compelled to enter gainful pursuits at an early age. Therefore the great need that our system of education should be so constructed as to equip these boys and girls with vocational and industrial knowledge that would make them, from the beginning, useful workers, enabling them to earn and demand a living wage and treatment that will not be injurious to their future welfare, as well as the opportunity to advance from time to time in their chosen occupations.

Among the tramps and hoboës, also in the ranks of those who are employed only when labor is scarce, we have found thousands of graduates of grammar and high schools, some even having the advantage of a university education, indicating that however cultural their education may have been it was not always of practical value in the mill, in the shop, or on the farm.

Private trade schools can not remedy this. They are operated generally in the interest of employers and do not give the most important element of education—namely, the interest of the workers themselves—the consideration it deserves.

The private training school can not cover this problem. All boys and girls require this practical equipment, and it can be secured only through and in connection with our system of public schools. To properly perform this duty, the general responsibility rests on all our people. It is a public and not a private function, and the State and Nation must be held responsible for its early and successful solution.

The needs of modern industry do not seem to be met by any existing scheme of training for general usefulness in the crafts or for the development of all-around mechanics. Therefore, the pressing need is for a general educational policy that will make possible a continuous development of both adults and minors in industry who are over 14 years of age. Boys or girls who go into the shop at 14 or later develop into specialists but not mechanics. If for any reason they lose their job they are no more fit for another place than they were when they first began. The work, therefore, that must be done for those already in industry is to train them to fit into work wherever help is required in the shop.

Our public schools must be prepared and required not only to give some vocational consideration to pupils over 14 years of age who remain in the schools, but to provide for compulsory continuation daytime schools on the time and at the expense of employers, and voluntary night schools for both academic and vocational training for boys and girls who are at work and for adults who desire further knowledge which will be of use in their vocation.

We hold that all experience shows conclusively that public instruction privately controlled or any plan that fails to comprehend the entire number of pupils in the United States is dangerous and unworthy of support.

We hold that the advantages of vocational education should be open to all adults or minors in the public schools if they remain after 14 years of age, and in night schools and continuation schools after they enter industry, and these advantages we believe should be provided entirely at public expense.

There seems to be but slight, if any, advantage to be obtained by undertaking vocational training of pupils before they reach the age of 14. Their entire time prior to that age is required to lay a foundation for what may be termed their general education. This being true beyond any question, the State must provide for education after entrance into industrial life as well as before. Fairness to all classes demands the opportunity for vocational teaching after the boy or girl of 14 or over has entered industry.

The children of the well-to-do parents are continued at school through the several years of high-school work entirely at public expense, in order to fit them for professions and business life. Is it unreasonable that the public should equally provide schooling for those who, because of economic pressure, must enter industry at from 14 to 16 years of age?

This the working class demands for their children, and it must be provided if our public-school system is to continue to hold a high place in the respect and esteem of all classes of our citizens. In a Republic such as the United States, the school system should be adapted to the needs of all classes, rich and poor; those who are to

enter professions and those who are to go into the shop, the factory, the mill, or to work upon the land.

We believe it to be assured that if all our schools will extend practical vocational teaching to cover instruction after 14 years of age, a very large number of pupils will remain at school until the age of 16 or even later, if the school is providing for their future usefulness and success as well as or better than can be done in the factory. This is the most important element in the consideration of the subject of industrial training. Keep the children at school as long as possible, extending their vocational knowledge, widening their academic training, teaching them not only their rights but their duties as citizens of our Republic, stirring their ambition for a life worth living, and making of them dear men and women rather than cheap.

It can not be denied that our public schools, as now generally conducted, do not accomplish as much work that is substantially effective in fitting their pupils for productive labor with their hands as should be the case. We must have a plan of education in the school that develops both the power to think and the power to do.

We find that as a rule the first eight years of the school life of a boy or girl must of necessity be very largely, if not entirely, devoted to work of a cultural character, for the reason that up to the age of 14, when the first eight years of school life are completed, neither boys nor girls have developed any clearly defined likes or dislikes as to what their life work shall be, nor can either parents or teachers be considered safe guides as to the careers of children of that age. Justice, as well as the best interest of the pupil, demands that the desires and wishes of the child shall have primary consideration in the determining of his life work, and to assign this work arbitrarily, either by the school board, the teacher, or even the parents, is not much less than criminal.

The schools should provide the greatest possible variety of occupations, making the opportunity of choice as varied as possible. And this vocational training should be in the same building as that where the child spends his first eight years in school, in order that by observation of the vocational work and by contact with the pupils and vocational teaching, he shall have every possible opportunity to determine what he wants to study for a vocation.

Industrial education in the United States is on trial. It will and should be judged by practical men and women, and that course should be pursued which promises the best possible results.

CONTROL OF VOCATIONAL SCHOOLS.

It is believed that all vocational schools should be a part of the public school system; that they should be entirely free, supported by the National, State, county, or city government; that all textbooks and equipment should be furnished to the pupils free; and that a plan of management of such schools should be developed which would give to the workers and employers in each community, in the State, and in the Nation, a potent voice in their entire control, in conjunction with the regular boards of school officials. As to vocational school work, the committee in control should consist of an equal number of members representing organized labor, organized

employers, and the regularly constituted school authorities, a majority of whom would be required to finally determine practices and methods. Every vocational teacher should be a practical man or woman from the trades or occupations taught; and the product, if any, of such schools, should not be sold on the market in competition with regular industry. Ample opportunity exists for the use of any possible product of the vocational schools by the city, county or State.

GENERAL RECOMMENDATIONS.

The establishment of vocational schools for all children in school over 14 years of age is advocated, as well as compulsory continuation and night vocational schools, with such academic work as may be advisable for all persons over 14 years of age in industry and agriculture.

Education vitally interests all our people and neither money nor time should be spared to make the education of the United States the most thorough, the most potent for human uplift and progress, of any system of education in the world. To lead in this great work is our proper position, not to follow. Thoroughness should be the aim of our Nation and our States. Poorly trained workers in industry are now entirely too plentiful. This should be overcome by excellent vocational training. We believe there are now too many cheap workmen. This Nation should work for men, women, and children who will not consent to cheapness, either in wages, conditions of labor, or character.

The public schools, whether academic or vocational, should be entirely neutral as to unions and their control, and exactly the same should be true as to the exercise of any control for class interests by employers or employers' organizations. And surely there is no room in our schools to warrant the teaching of any degree of hostility toward trade unions or employers' organizations.

The general recommendations of the special commission on national aid to vocational education have our most hearty approval and we approve of the passage of a law by the Congress of the United States with that end in view. The need of the States for such assistance is clearly set forth.

It is recommended that Congress authorize by law the creation of a Federal board to administer funds appropriated by Congress to the several States for vocational education, the board to consist of three members, one educator, one representative of organized labor, and one representative of organizations of employers, to be appointed by the President with the consent of the Senate, to serve for a term of six years, the first appointments to be for two, four, and six years; with salaries of \$8,000 each per annum; the Federal board so constituted to establish rules and standards for expenditure of Government funds awarded to the several States.

The Federal board shall require of each State asking for Government funds the adoption of the following standards before any awards can be made or funds be appropriated by the board:

1. Compulsory daytime continuation schools for all children in industry between the ages of 14 and 18 years, for not less than five hours per week, at the expense of their employers.

2. Night schools for all persons over 18 years of age who are desirous of further educational opportunities, either cultural or vocational.
3. Standards of efficiency for teachers.
4. Joint State control in administration of vocational education by public-school authorities, organized labor, and organized employers, with equal representation.
5. The Federal board to establish some model schools for industrial training in agriculture and vocations, as examples to the several States.

This problem of vocational education not only is important materially but is intimately a human problem, involving as it does the social welfare and progress of all the people.

The boys and girls of the farm, if assured by proper education of becoming generally successful farmers, will remain farmers, rather than undertake to compete in the industries with properly trained workers of the cities. This will help to solve the problems that are threatening injury to our great agricultural industries, and will eliminate a cause of industrial unrest.

In the farming districts the country school remains practically as it was 50 years ago. Pupils are not taught what is essential to develop them into excellent farmers and farmers' wives, but the cultural education of days gone by is continued, to the considerable exclusion of teaching how to farm and how to manage a farmer's home. Surely the Nation has here a mission of helpfulness to perform that which, as a great nation, it can not longer afford to leave largely neglected. Its prosperity as a nation depends upon the character and efficiency of its men and women much more than upon its geographical position or the quality of its soil, and to build character and effectiveness we must lay the foundations well by a proper education of our boys and girls. We should not strive merely for educating them into correctly working automatic machines. The human side must be uppermost and receive attention of the most careful nature. It is not worth while to make square holes and then try to fit into them round men and women.

Education should take into account, at every stage, manhood and womanhood, and where and how the life is to be surrounded, and what can be done through education to make each life successful and therefore worth while. Dexterity is worth while, but good character is more vital to real service in the world of industry and civilization. At present our schools in city and country do not make good, either in the development of skill, in the duties of service, or in a clear understanding of human rights and consequent human duties toward our fellows. Industrial education can not possibly take the place of industrial experience. All that can be hoped for is that our schools will make their teaching a real preparatory process for entering upon industrial life, with proper conception of life work instead of no conception at all.

CONTINUATION OR PART-TIME SCHOOLS.

All minors entering industry after 14 years of age are entitled to further aid from organized society in order to enable them to complete their vocational and cultural education. This is possible only through the establishment of compulsory day time continuation schools of at least five hours per week, at the expense of employers, and night schools. The eagerness with which minors and adults

take advantage of such schools is sufficient evidence to warrant legislation giving these opportunities to all minors and to such adults as may care to take advantage of them. These schools, in order to be of value, must be compulsory upon all minors in industry up to at least 18 years of age. Schools in the United States should meet fully the needs of every class of pupils, those who expect to enter colleges and prepare for the professions as well as the much larger class that is to enter industrial life. The parents of the wageworking class contend, with much reason, that their children are not given the same vocational consideration under our present school systems as are the children of the well to do who expect to become lawyers, doctors, etc.

The State has established schools to train, for a useful industrial life, the mentally, morally, and physically deficient, and this effort has the hearty approval of every good citizen. If this work is worth doing, then it must be of vastly greater importance to establish one general scheme of education so as to make useful men and women out of the normal boy and girl, and neither expense nor investigation should be spared to accomplish this most desirable object.

TEACHERS.

It seems self-evident that no one can successfully teach others that of which he has no knowledge himself. We recommend, therefore, in the selection of teachers to impart trade education that only practical workmen shall be used. They should be selected with care as to character, and, as far as possible, craftsmen should be selected as trade teachers who have a considerable degree of cultural education. The opportunity should be continually extended for the proper education of teachers capable of teaching vocations, and, in so far as it may be advantageous, academic education also. The need of well-developed brain power is not waning in the least. What is demanded is the educated hand to apply in industry the ideas and knowledge of the brain. Our children need to know more as to their economic value and more of their social duties and responsibilities. The schoolhouse is the place where much of this should be taught, in order that the duties of honorable citizenship shall be appreciated. Real social service is the highest attainment the individual can aspire to reach. All education is of value in life, and the State should properly be held responsible for the education of her children, in order that the best possible use shall be made by the greatest possible number of the opportunities of life as they present themselves from year to year.

CONCLUSIONS.

The existing system of public education is inadequate. The present specialization of shop conditions is not favorable to a complete mastery of any trade or calling in the shop, store, or industry. This being admittedly true, it devolves on our public-school system to meet adequately the emergency in conjunction and cooperation with industry. The temperamental difference in children must have consideration in determining their life work and preparation therefor. The boy or girl must not become merely a cog in the great wheel of industry. Therefore the urgent need of vocational education in con-

junction with practice in the shop or factory that makes each individual in a few years capable to fit into any place in the industry where help may be required. We now have too many handy men and specialists, who have no place into which they can fit when for any reason their particular work is no longer required.

Vocational education, on account of the wonderful changes in industrial production, must take the place of apprenticeship. To solve this problem right is to find a solution for much of the unnecessary social unrest of our day and generation.

There can be no question that industrial education is coming rapidly. Prejudiced opposition will be futile. The necessity is great and it must and will be met. The National Government should properly perform its full share of the responsibilities of meeting this demand for the best and fullest education of our children.

The entire subject is dealt with exhaustively in the report of the Special Commission on Vocational Education, which submitted its report June 1, 1914.

IV

ADDITIONAL FINDINGS OF FACT, CONCLUSIONS, AND RECOMMENDATIONS

ADDITIONAL FINDINGS OF FACT, CONCLUSIONS, AND RECOMMENDATIONS.

At regular sessions of the commission with all members present, the following resolutions were offered for adoption as a part of the commission's report to Congress. The members of the commission whose names appear in connection with the various resolutions voted for their adoption and thereby made the resolutions a part of their individual reports to Congress.

ADOPTED BY UNANIMOUS VOTE.

Whereas the commission finds that the terms "open shop" and "closed shop" have each a double meaning, and should never be used without telling which meaning is intended, the double meaning consisting in that they may mean either union or nonunion: Therefore, for the purposes of this report, be it

Resolved, That the Commission on Industrial Relations will not use the terms "open shop" and "closed shop," but in lieu thereof will use "union shop" and "nonunion shop."

The union shop is a shop where the wages, the hours of labor, and the general conditions of employment are fixed by a joint agreement between the employer and the trade-union.

The nonunion shop is one where no joint agreement exists, and where the wages, the hours of labor, and the general conditions of employment are fixed by the employer without cooperation with any trade-union.

Wherever the terms are used in this report, they bear the interpretation as set forth above.

ADOPTED BY MAJORITY VOTE OF COMMISSIONERS WALSH, LENNON, O'CONNELL, GARRETSON, AND WEINSTOCK.

The sources from which industrial unrest springs are, when stated in full detail, almost numberless. But, upon careful analysis of their real character, they will be found to group themselves almost without exception under four main sources which include all the others. These four are:

1. Unjust distribution of wealth and income.
2. Unemployment and denial of an opportunity to earn a living.
3. Denial of justice in the creation, in the adjudication, and in the administration of law.
4. Denial of the right and opportunity to form effective organizations.

We recommend that private ownership of public utilities be abolished and that the States and municipalities take over the same under

just terms and conditions, so that they may be operated by the States or municipalities.

RECEIVED APPROVAL OF COMMISSIONERS WALSH, LENNON, O'CONNELL, AND GARRETSON.

We find that the limitation of the right of suffrage to men has been a most serious handicap to women in industry in their long and splendid struggle to secure compensation for their labor, humane working conditions, and protective laws.

We recommend that private ownership of coal mines be abolished; and that the National and State Governments take over the same, under just terms and conditions, and that all coal lands shall thereafter be leased upon such terms that the mines may be cooperatively conducted by the actual workers therein.

All religions, the family life, the physical well-being of the worker, the integrity of the State, and the comfort and happiness of mankind require that no human being shall be permitted to work more than six days in each week. This commission refuses to recognize any claim of so-called business expediency or alleged domestic or public necessity which ignores this elemental and righteous demand. We therefore suggest that stringent laws be passed by State and Nation making it an offense punishable by fine and imprisonment to permit any person to work more than six days in each week.

We find that practically nothing has been done toward the very necessary development of organizations of women engaged in domestic service, and that no standards governing the toil of the thousands thus engaged have been established.

As a necessary step in this direction we recommend that the hours of such workers should be limited to eight per day; that no such persons be permitted to work over six days in each week; that a minimum wage be fixed for this class of employees which will insure them a comfortable life without being required to live in the homes of persons employing them, where they may be subjected to objectionable or uncomfortable living conditions.

That all of the improvements and safeguards recommended for adoption in this report as applying to women in other lines of industry shall apply with equal force and effect to women engaged in domestic service.

We find that the direct and proximate cause of the killing of men, women, and children, destruction of property, and looting of the homes of the striking miners in the southern Colorado coal fields during the strike therein was the arbitrary refusal of the coal-mine operators to meet and confer with the representatives of the workers in their several mines. Inasmuch as the officials of the Colorado Fuel & Iron Co. admit that said company fixed the prices and conditions of labor in the State of Colorado at the time in question, after fully considering and weighing all of the testimony advanced at the public hearings, and especially the admissions and declarations of the officers and directors of the Colorado Fuel & Iron Co., including Mr. John D. Rockefeller, jr., we find that the final and full responsibility for the refusal to confer with said representatives, and for all the deplorable results which followed such refusal, must be

placed upon Mr. John D. Rockefeller and Mr. John D. Rockefeller, jr.

We wish to report to your honorable body that Mr. John D. Rockefeller, jr., and Mr. W. L. Mackenzie King, witnesses regularly called before this commission, refused to answer questions relevant and material to the inquiries provided for in the act of Congress creating this commission, as shown by the excerpts from the official transcript of the testimony filed herewith and attached hereto, and we therefore recommend that the said witnesses be summoned by the House of Representatives, according to its usual procedure, immediately upon its convening, or as soon thereafter as may be reasonably convenient, and that said questions again be propounded to said persons, and that they be compelled to answer the same.

QUESTIONS WHICH MR. W. L. MACKENZIE KING REFUSED TO ANSWER.

Chairman WALSH. What salary do they pay you?

Mr. KING. That is a matter you do not have a right to inquire into. I was asked if I would undertake this work for a period of years. I said I would not, that all I would undertake to do was to take it for a year; that I wanted to be perfectly free at the end of a year to terminate my arrangement with the Rockefeller Foundation if I did not see it was going to give the opportunity for the practical results I wanted to get. I made an undertaking with them on that basis, with that understanding, and they asked me to take it for another period of time, and I refused, and I made the further stipulation that if by any chance an election should be brought on in Canada, I should resign before that time. I think under those circumstances the public would hardly expect me to answer what particular remuneration I am receiving.

Chairman WALSH. Are you going to make your report to anybody? Are you going to give anybody these facts that you are collecting, the result of these interviews?

Mr. KING. No, sir; I have not decided that, but if you mean am I going to give them to anybody connected with the Foundation or Mr. Rockefeller, I would say no.

Chairman WALSH. Are you going to give them to the Government?

Mr. KING. No.

Chairman WALSH. Are you going to give them to the organizations of workers?

Mr. KING. I will give them the results.

Chairman WALSH. But as far as the facts are concerned, your purpose is to keep them absolutely secret?

Mr. KING. No, sir; I would not be telling the truth to say that.

Chairman WALSH. Who are you going to tell them to?

Mr. KING. On that I shall use my own judgment.

Chairman WALSH. Did you talk to the president or secretary or treasurer of the United Mine Workers of America in Denver?

Mr. KING. I have said already, Mr. Chairman, that I desired to have regarded as confidential the persons that I saw.

Chairman WALSH. Did you call upon the president, the secretary, or the treasurer of the State Federation of Labor of Colorado?

Mr. KING. I have already stated that I intend to regard as confidential the interviews that I had in Colorado. That is my position in regard to that. * * *

Chairman WALSH. I asked if you saw the president, the secretary, or the treasurer of the United Mine Workers of America or the president, the secretary, or the treasurer of the State Federation of Labor of the State of Colorado?

Mr. KING. I remain just exactly where I put myself before.

CHAIRMAN WALSH. You refuse to answer that question?

Mr. KING. I refuse to disclose any of the interviews I had in Colorado; and let me make this perfectly plain, Mr. Chairman. I saw some of the persons you have mentioned—

Chairman WALSH (interrupting). Name them.

Mr. KING. No; I will not. I do not intend to disclose the names, and I do not intend to let the impression go abroad that I avoided seeing anyone, not for one minute. * * *

Chairman WALSH. Did you find it [industrial unrest] very bitter in Colorado?

Mr. KING. I prefer not to discuss the Colorado situation at all.

Chairman WALSH. Please outline for this commission the policies which you consider should be put into effect in Colorado in the industry of the Colorado Fuel & Iron Co.

Mr. KING. No, Mr. Chairman. I have said I do not desire to discuss the Colorado situation.

Chairman WALSH. Do you consider that the miners in Colorado were justified in demanding a recognition of their national union?

Mr. KING. I have already said I don't care to discuss the merits of that strike one way or the other.

Chairman WALSH. Where do you keep them [referring to notes Mr. King testified he had made in Colorado]?

Mr. KING. I am not going any further in my answer.

Chairman WALSH. Think again, and maybe you will go further?

Mr. KING. No; I won't.

Chairman WALSH. Are they in charge of anyone else or in your possession?

Mr. KING. That is my affair, Mr. Chairman.

Chairman WALSH. Are they kept in New York or Washington or at your home?

Mr. KING. They are not kept either in New York, Colorado, or at my home at this moment.

Chairman WALSH. In Washington?

Mr. KING. I have nothing further to say.

Chairman WALSH. It is a dead secret?

Mr. KING. Yes; a dead secret.

QUESTIONS WHICH MR. JOHN D. ROCKEFELLER, JR., REFUSED TO ANSWER.

Chairman WALSH. It is not in a letter. It was in a newspaper statement. Did you write your own newspaper statements, or were they dictated, or were they written by some one else?

Mr. ROCKEFELLER. I assume the responsibility for everything that was sent out in my name. * * *

Chairman WALSH. Did Mr. Ivy Lee write the newspaper interviews purporting to come from you?

Mr. ROCKEFELLER. I have answered the question.

Chairman WALSH. Do you assume the responsibility for that?

Mr. ROCKEFELLER. For everything that goes out in my name.

Chairman WALSH. I am asking for the fact. Did you write it?

Mr. ROCKEFELLER. I have covered the situation, Mr. Chairman.

Chairman WALSH. You do not care to go any further?

Mr. ROCKEFELLER. I do not. I do not think it necessary.

Chairman WALSH. Did you write that answer? [Referring to the prepared statement which Mr. Rockefeller read upon the stand.]

Mr. ROCKEFELLER. I take the responsibility for that entire answer.

Chairman WALSH. Did you write it or did somebody else write it for you?

Mr. ROCKEFELLER. It is not a matter that I think is material.

Chairman WALSH. Did Mr. Lee write it?

Mr. ROCKEFELLER. I have no further answer to give.

Question. What agreements or understanding, verbal or written, exist between the Foundation and Mr. King, regarding the scope of the work which is to be done under his direction, and the method of investigation which is to be pursued?

(a) By whom was the arrangement with Mr. King made?

Answer. Mr. King was appointed pursuant to a resolution adopted at the meeting of the executive committee of the Rockefeller Foundation held August 13, 1914, of which the following is a copy:

"Resolved, That William Lyon Mackenzie King be, and he is hereby, appointed to make a comprehensive study of the problem of industrial relations at a salary of \$—— a year from October 1, 1914.

"It was, on motion, further

"Resolved, That the secretary be authorized to approve all bills for necessary traveling expenses and all other expenses incurred by Mr. King in the

pursuance of his work under the direction of the executive committee. The secretary presented a recommendation from Mr. King for the employment of Robert F. Foerster, Ph. D., to prepare a catalogue, etc."

The amounts of the salaries have been omitted as being information of a confidential nature not material to this inquiry.

RECEIVED APPROVAL OF COMMISSIONERS WALSH, LENNON, AND O'CONNELL.

The money with which the Rockefeller Foundation was created and is maintained consists of the wages of workers in American industries. These wages were withheld by means of economic pressure, violation of law, cunning, and violence practiced over a series of years by the founder and certain of his business associates.

Under the law as it now exists, it is impossible to recover this money and pay it over to the equitable owners. We therefore recommend that appropriate legislation be passed by Congress, putting an end to the activities of this foundation, wherever the Federal law can be made effective, and that the charter granted by the State be revoked, and that if the founders have parted with the title to the money, as they claim they have, and under the law the same would revert to the State, it be taken over and used by the State for the creation and maintenance of public works that will minimize the deplorable evil of unemployment, for the establishment of employment agencies and the distribution of labor, for the creation of sickness and accident funds for workers, and for other legitimate purposes of a social nature, directly beneficial to the laborers who really contributed the funds.

COMMISSION ON INDUSTRIAL RELATIONS.

WASHINGTON, D. C., December 29, 1913.

Present: Frank P. Walsh, chairman, Missouri; John R. Commons, Wisconsin; Mrs. J. Borden Harriman, New York; Frederic A. Delano, Illinois; Harris Weinstock, California; S. Thruston Ballard, Kentucky; John B. Lennon, Illinois; James O'Connell, District of Columbia; Austin B. Garretson, Iowa, commissioners.

The commission met, pursuant to adjournment of Saturday, October 25, 1913, at 10 o'clock a. m.

Commissioner COMMONS. There are two corporations which have recently been formed that are represented here. One is called the National Council of Industrial Safety. The men concerned with that are Mr. J. D. Beck, Mr. W. H. Cameron, and Mr. R. W. Campbell, president of that council, and Mr. C. W. Price. Those four men represent the National Council of Industrial Safety. That council represents the expert safety men of the largest corporations of the country. They propose to tell the work that they are doing and how their organization is effected, what its purposes are, and the results that they have accomplished, and to offer cooperation of some kind with this commission. The other organization is a newly created one of the State and Municipal Bureaus of Labor Employment. The men who represent that are Mr. Croxton, who was formerly in the Bureau of Labor here in Washington, and is now at the head of that work in Ohio.

Commissioner GARRETSON. Was he with the Labor Bureau of the Interstate Commerce Commission

Mr. LAUCK. The Bureau of Labor Statistics.

Commissioner GARRETSON. Was he not detailed for service with the commission just before leaving?

Mr. LAUCK. That was just in an advisory capacity.

Commissioner GARRETSON. That may have been so. I knew the man as an Interstate Commerce Commission man, but not a Department of Labor man.

Mr. LAUCK. No; he was from the Bureau of Labor Statistics, and was over there advising about railway wage statistics.

Commissioner O'CONNELL. What is his name?

Commissioner COMMONS. Croxton. The other interested party is L. A. Halbert, who has charge of the work in Kansas City, and who has done some good work in connection with employment offices. The third man, Mr. William Leiserson, has charge of the employment offices in Wisconsin.

These people have recently effected a national organization extending from Massachusetts to Oregon, of an organization of public employment offices, and are working out plans of uniformity in interchange, and are thinking of a large organization to develop that line of work throughout the country.

Those two organizations are here as organizations, or at least as individuals in an executive capacity in those organizations, and they have definite and specific things in mind to bring up.

On farm labor there are two people here, Mr. Charles W. Holman, of the University of Texas, who has knowledge of the Renters Union, of the I. W. W. organization of farm laborers in Texas, and Mr. Herbert Quick, representing one of the agricultural papers. These men would naturally come at the same time when the consideration of other employment questions come in.

Commissioner DELANO. Who is that?

Commissioner COMMONS. Charles W. Holman and Mr. Quick, a newspaper man. I took up the matter of inviting these people and talked it over with Commissioner Walsh, with the idea that we would get before us three large movements in general that are going on, that we would have to take account of, and those who are urgent in getting a hearing first would be the Council

of Safety men. They would like to close up at one continuous session and then get away. They must get away this evening. The others will be like Mrs. Kelley. Now, if there are any other individuals like Mrs. Kelley who wish to be heard to-day—

The CHAIRMAN. After these names were agreed upon by Prof. Commons and myself I talked to Mrs. Harriman, and she thought she would like to have two who would pay particular attention to woman and child labor, and at Mrs. Harriman's suggestion I invited Mrs. Florence Kelley and Mrs. Robins, and they are here.

Commissioner HARRIMAN. You might speak of the matter of the advisory board.

The CHAIRMAN. Yes. Mrs. Harriman had an idea that it might be a good thing to have an advisory board of women throughout the country, but that will come up later. Are they going to make some suggestions about that?

Commissioner HARRIMAN. They are on that board, and they are going to make suggestions.

The CHAIRMAN. Mrs. Harriman, you asked a number of women throughout the country to cooperate with us as an advisory board?

Commissioner HARRIMAN. The idea of that was that we would try to get both radicals and conservatives, so that they could go along with us and make suggestions and criticisms on the question of woman and child labor rather than oppose us and tear everything to pieces.

Commissioner O'CONNELL. You have succeeded, as far as those two are concerned—

Commissioner HARRIMAN. In getting radicals?

Commissioner O'CONNELL. Yes.

Commissioner HARRIMAN. Do you not think it is a good idea to have their suggestions and that it is better to have them with us than to have them going after us and tearing everything to pieces?

Commissioner O'CONNELL. You have succeeded at the start, anyway.

Commissioner COMMONS. May I ask the members of this National Council of Industrial Safety to come before us now?

Commissioner HARRIMAN. I had a letter about that man who is going to Australia. He is going to start to-morrow, I think. Chairman Walsh has the letter. He is going to Australia on some other business and make some investigations for us, and as he is here and can be seen to-day it might be a good thing to invite him up.

The CHAIRMAN. Mr. Lauck took that up with me this morning, but we concluded we did not have time to hear him to-day.

Commissioner HARRIMAN. While I was in New York I found that he was considered to stand very high. I do not know him myself.

The CHAIRMAN. Mr. Lauck thought we could not do anything worth while in the time he had if he had to go to-morrow.

Commissioner GARRETSON. He could not make anything plain in that time.

Commissioner COMMONS. I was going to ask whether we shall hold an evening session. If so, we might ask Mrs. Kelley and Mrs. Robins to appear this evening and be sure of finishing the hearing with these other people this morning and this afternoon.

Commissioner HARRIMAN. Anything will suit me.

Commissioner GARRETSON. If they are going away to-night, we will accommodate them in any way we can.

Commissioner DELANO. This Safety Committee are going away this afternoon.

Commissioner BALLARD. Our commission has employed a managing expert and, as I understand, we propose to put into various fields experts selected by our managing expert, and probably men who are recommended to the commission, and finally to be employed by the commission after careful examination; and I had the impression that these experts were the ones on whom we were to rely for our facts and for our work; and the mere fact that a very good man is going to Australia is no particular reason why this commission should employ him or even be in particular communication with him to make any investigation on which the commission is to rely. I should imagine that before our commission expires we will probably want to send some one, possibly to Australia or elsewhere, to make such investigations as we feel we need; but I imagine that the investigators that this commission will employ will be persons who have been very carefully recommended and very carefully considered, to be sure that they will make such investigations as we need absolutely without bias, and so that the commission may rely upon the information which they furnish to us. I am sat-

ified that a great number of reports that have been made have been more or less biased, and therefore the commission could not accept their conclusions as final. We will be able to make our own investigations, and I am inclined to think that the only experts this commission should have in the field are those who have been carefully considered, carefully investigated, and then carefully approved.

Commissioner LENNON. Mr. President, it seems altogether advisable to hear these other people first. The matters that the chairman desires to submit, which have been referred to by Mr. Lauck and Mrs. Harriman and others may take considerable time for discussion. Suppose we get rid of this hearing and then have our executive session, when we can spend a whole day at it. Is it a matter that can not lie over?

The CHAIRMAN. No; not at all. I understood we had got past that point and that we are going to hear these Council of Safety people.

Commissioner LENNON. Then I move that we begin the hearings, commencing with these safety appliance people, followed by the two women, and then the others just as rapidly as we can reach them.

Commissioner COMMONS. I second that motion.

Commissioner WEINSTOCK. Would it not be well to fix a time limit? Otherwise some of these gentlemen may keep us here two hours at a stretch.

The CHAIRMAN. I think they have all been warned by Commissioner Commons.

Commissioner O'CONNELL. They will not all want to talk.

Commissioner COMMONS. There will be no reiteration.

Commissioner WEINSTOCK. Sometimes when you get an enthusiast before you he overlooks his good stopping points.

Commissioner GARRETSON. His brakes get out of order.

Mr. LAUCK. How about the two women?

The CHAIRMAN. Let them follow immediately.

Commissioner HARRIMAN. Before they come may I say a word in explanation of why they were asked and what the idea was?

The CHAIRMAN. Yes.

Commissioner HARRIMAN. We had so many applications, so many people writing to us all the time, asking what was going to be done in the way of woman's work especially, that we thought we would take everything relating to women and children and put them in one column, and then eventually throw them all back again for a final report, and that we would consider the questions as to the policies that need to be changed. That was the idea Mr. Lauck and I had, and then we thought if we could get an advisory committee of women who were interested in that question, to work throughout the country, and if they could come on here semioccasionally if there was any necessity for it, and hold a meeting, and also if we could send them reports of work as we went along, once in a while, and get their criticisms on it, it would in the end make it much simpler for us than if we did not listen to them and they were ready to tear everything to pieces.

Commissioner LENNON. Most of the women's organizations of the country have written to me, stating that because I have worked with them they expected me to look after the interests of women and children in this investigation. I have worked with them all of my life, and have always worked more with women than with men. That was the reason they expected me to look after their interests. I told them we had a woman on the commission, and I turned their attention toward her to get their work done, telling them at the same time that I would help if I could.

Commissioner HARRIMAN. That is probably the reason why so many of them have written to me. We can work together.

Commissioner LENNON. All right.

Commissioner HARRIMAN. Would you like to know the names of the women who have been proposed for the advisory committee?

The CHAIRMAN. We will get at that later. Is there any further discussion of the motion?

Commissioner DELANO. Has the advisory committee been appointed, or only recommended?

Commissioner HARRIMAN. They have been invited.

Commissioner O'CONNELL. I am interested in the women, of course, and believe in the investigation of these questions, but I do not propose to let the women go so far that they may backfire and then put the blame on somebody else.

Commissioner DELANO. The only thing that occurs to me is that if we appoint an advisory committee of women, will we not be in a position where we can not decline an advisory committee of miners, an advisory committee of railroad men, and advisory committees of various other organizations and interests?

Commissioner HARRIMAN. This is not for the commission. It is just in connection with that department, to show them that we had taken up the question of the work of women and children. It had nothing to do with the commission proper.

Commissioner O'CONNELL. It is a division of the commission's work, though?

Commissioner HARRIMAN. Yes; but it was a kind of informal thing and they could be dropped at any time we wanted to do so.

Commissioner GARRETSON. With the power of suggestion only?

Commissioner HARRIMAN. Yes.

Commissioner WEINSTOCK. That is all we have.

Commissioner HARRIMAN. We are never really going to get them together.

Commissioner WEINSTOCK. Are they not supposed to come together and meet?

Commissioner HARRIMAN. No. We said if necessary we would call them here.

Mr. LAUCK. But the idea was never to get them together, because that would be an impossible situation.

Commissioner LENNON. And I think a most dangerous situation.

Commissioner HARRIMAN. Could not the commission dispose of the question? I can easily tell them, without hurting their feelings.

Commissioner O'CONNELL. It is perfectly right for whoever has charge of that department to advise with women in every way possible.

Commissioner WEINSTOCK. I want to raise the point of order that there is a motion before the house.

Commissioner LENNON. I had a very pleasant interview with Miss Adams a week ago, and she said she had had a very cordial invitation to pay her fare to Washington any time she wants to make any suggestion, but that she did not think she was likely to come.

Commissioner HARRIMAN. That was not what she said. She said if they wanted her, if they felt it was necessary, she would pay her fare.

Commissioner DELANO. Miss Adams would be more bashful about coming forward than some of them.

Commissioner LENNON. These safety people are here, and we can give them a hearing. They are here on the ground, and I renew my motion that we give preference first to the safety men, and then to the ladies.

The CHAIRMAN. It has been moved and seconded that we proceed with the business of hearing those who have been mentioned by Commissioner Commons and Mrs. Harriman, hearing first the gentlemen on safety and sanitation, and next the ladies. Are there any remarks on the motion?

The motion was agreed to.

The CHAIRMAN. We will hear Mr. Price and his party first.

Commissioner BALLARD. This hearing is entirely open?

The CHAIRMAN. Yes.

Commissioner DELANO. Is there any particular reason why the gentlemen must be heard first?

Commissioner LENNON. The only reason why I offered that motion was because of the seeming necessity for them to get away. There is no other reason.

Commissioner COMMONS. They are very anxious to get away.

The CHAIRMAN. Dr. Price, we have concluded to hear you gentlemen first on this question of safety and sanitation, and we thought we would let you divide it to suit yourselves. I have mentioned you by name, because I spoke to you before.

Mr. PRICE. Mr. Beck will make the first statement.

The CHAIRMAN. Mr. J. D. Beck, of the Wisconsin Industrial Commission, formerly labor commissioner, will first address the commission.

STATEMENT OF MR. J. D. BECK.

Mr. BECK. Mr. Chairman and members of the commission, I happen to have been labor commissioner for six years prior to the enactment of the industrial-commission law in our State, and, as such, I felt that we had done some things in Wisconsin and were doing some things; we were encouraged in that belief by

investigations that were made of the work of the department by various philanthropic societies and others coming into the State and looking over our records and the work; yet, from year to year, we could discover that the factory and other industrial accidents were increasing, and the prosecutions for violation of our laws increased from a few per year up to 365 a year, which was an average of one a day. That seemed to be the measure by which our work was judged. It seemed to me that something was wrong. We were having a great many prosecutions, it is true, and the laws were being enforced as well as we felt that the laws themselves and the courts of our State would permit them to be enforced.

In 1907 we started an investigation of industrial accidents and workmen's compensation. That investigation was made by the deputy of the department, Mr. Lorenz, who was assistant professor of economics in the University of Wisconsin at the time he was appointed. He went into the study somewhat extensively, and his report was turned over to a legislative committee, appointed at the next session of the legislature, who thought the subject was of sufficient importance to require further inquiry, and a committee of that legislature was appointed to make a further study of the subject. The chairman of that committee was Senator Sanborn, of our State. He began holding hearings around at various industrial centers, taking such data as he could find on the subject of accidents, employers' liability, and what the courts had done in various cases which had been taken up through the courts, and so forth and so on. After holding a few hearings, he would call the committee together, they would go over the data, and they would draft a tentative bill which they thought would meet such problems as had developed. Those tentative bills would be sent out to the various labor organizations, to the various manufacturers' associations, and to the various individuals who might be interested in the subject, and suggestions, criticisms, and the like were asked for. That was not only confined to our State, but it was sent all over the country; and, when sufficient information had been gathered to warrant a further hearing, a new bill would be drafted, and so on. For two years that was the course which the tentative bills had to pursue. The result was the workmen's compensation act, such as we have in the State of Wisconsin.

Now, in the meantime, the bureau of labor had endeavored to solve the accident problem, so far as possible, in another way. We called a meeting of the representatives of the State federation of labor, representatives of the State manufacturers' association, and representatives of insurance companies doing business in Wisconsin, who were inspecting factories and insuring employees against liability for damages, and the like. We drafted something like 300 rules of safety to be followed which we thought we might put into operation, but we found that something was lacking. In the first place, I do not believe the employers of our State realized the situation. They did not realize the number of accidents that were happening; and, in the second place, the old law stood in our way. The old law, or the theory on which we had gone in legislating against accidents, was the enumeration of dangerous points and places. For instance, we started out with a law on safety. It ran something like this, that all set screws, bull wheels, flywheels, tumbling rods, belts, etc., must be securely guarded. The legislature would, from year to year, add some other term to that law, and finally, I presume, it gave up in despair of keeping up with dangerous points that were being brought into existence by our modern industrial developments, so it added the phrase "and all other dangerous machinery" to cover everything that might be considered dangerous. But the courts have held that such a phrase as that must be interpreted in the light of what has been said preceding in the law, and in two or three States I think it has been said that a buzz saw, for instance, was not a machine similar to a bull wheel, flywheel, or tumbling rod, consequently the term "all other dangerous machinery" did not apply to it. So we started out in the year 1911 with a different theory of safety.

We did not repeal all our safety laws, but we did say in the law that all places of employment must be made safe, and the law defined the word safety as meaning such freedom from danger to life, health, and welfare of employees as the nature of the business would reasonably permit. It provided that the Industrial Commission should make an inquiry into industrial conditions to determine what places of employment were not safe, and to issue such orders as might be necessary to make them safe. In other words, it provided that the Industrial Commission should determine the fact of safety and order that conditions be made as safe as the nature of the business would permit. It also

provided that we might appoint advisory committees to help us work out the problem of safety, and any other problem that came under the law. The first thing that we believed to be necessary was to secure the services of some one who had done a great work in the line of safety. We searched the country over, from Maine to California, to find out what some large institution had done in promoting the welfare and safety of their employees, and started him out on our inquiry. We did this, and the next step was to appoint our advisory committee. We asked the State federation of labor to recommend to us two persons to serve on that committee; we asked the Manufacturers' Association of the City of Milwaukee to recommend two of their members; we asked the State manufacturers' association to recommend to us two of their members to serve on the committee. The Industrial Commission then took two men that had done considerable work in safety lines in two of the largest factories in Wisconsin to represent it on the committee. In the meantime, a mutual insurance company under the workmen's compensation act had been organized in the State, and we placed a representative of that company on this committee, and we started them to work in the city of Milwaukee.

The first meeting they had they did not get very far. The manufacturers would sit on one side of the table and the representatives of labor on the other side, and anything that was proposed by one the other would say could not be done—"You can not do this" or "You can not do that" or "You can not do anything." The second meeting they did not get any further. The third meeting they got down to discussing one or two concrete rules, but nothing was done further than that. At the fourth meeting I believe they began the adoption of rules, and perhaps got seven or eight passed unanimously by the committee; and I remember they came to the rule requiring a safety governor on an elevator that traveled so many feet. The tentative rule as worked out by the secretary of that committee provided that a governor shall be on all elevators that traveled 15 feet or more. The employers, and one of them in particular, began to object, saying, "We could not do that; there is no necessity for it, and no sense in it," etc. The question was raised as to what other States were doing, and, as far as we could find out, other States that had adopted any laws on that subject required a governor on all elevators traveling 25 feet or more. Well, the employers felt that they might adopt that rule, inasmuch as other States had established a 25-foot limit, but they did not think Wisconsin ought to go any further. Some one said Chicago had adopted a rule requiring governors on elevators which traveled 20 feet, and some thought they ought to go as far as the rest had gone. One of the manufacturers who afterwards confessed to the commission that he had sought appointments of this advisory committee for the purpose of seeing that nothing was done, weighed about 300 pounds; and he sat over at the middle of the table, and he had not taken part in any of the discussion at all; and when they were about to vote on the 20-foot limit he said, "Well, boys, if you are going to drop me, don't let it be over 15 feet." And from that time on the committee never had any further trouble in adopting rules. In fact, the employers on that committee we had to hold back many times to see that they did not go too far.

When I say too far I mean this: I had been at the head of the department long enough so that I knew there were some things we could do and some things we could not do; and there was not any sense in that committee adopting rules so stringent that the Industrial Commission could not enforce them. So we had more trouble in holding back some of those employers on that committee and keeping them from going too far than we had to get them to go far enough. There was never any question from that time on as to what that committee would do. We just had a case recently where the First National Bank of Milwaukee had appealed to the commission to set aside an order on an elevator. The bank is an absolutely fireproof building; I do not believe there is a stick of wood in it anywhere. Our rules require that elevators built after a certain date should have a fireproof inclosure from the bottom to the top. When you come to consider that it is a national bank, the largest, perhaps, in the State, composed of men who are powerful, measured by wealth, at any rate, one would naturally suppose they would have some influence on that larger committee in getting that order set aside; but they insisted that that order must be carried out regardless of influences that were being brought to bear.

So it has occurred to us many times that much of the trouble that arises between employers and employees could be thrashed out and settled between

the employers and employees could they sit down to a table together and talk over their differences and look over one another's problems as they are. At least that is what we have found to be true in the State of Wisconsin.

Now, the principal trouble with the old law was its inflexibility. The law required a fire escape, for instance, on a building whether it was absolutely fireproof or whether it was a frame structure that would catch fire and burn up in 15 minutes. It required the same fire escapes on a building which had 10 or more employees that it required on a building which had 10,000 employees. The same was true with all of our safety legislation. The fact that a set screw killed 25 men in the State of Wisconsin does not mean that all set screws are dangerous, for instance. I remember one time we ordered a fire escape on a building which contained 800 people, a frame building. There was a building across the street that had about the same number of people which was built as nearly fireproof as a building could be made. We were not inclined to order a fire escape on the fireproof building, at least until we had brought those frame buildings up to a higher standing. But when the inspector went to issue the order the owner said, "All right, I will build it, but you will have to order one on my neighbor's building across the way." The inspector replied, "But that building does not need a fire escape." "I do not care; the law says it must be done, and if you do not do it I will have you up for malfeasance in office." And so the only thing to do was to order them on both of those buildings. That created many times an unnecessary hardship. Now, our law as it is to-day is more flexible. If we find, for instance, that an order does not apply, one of our rules requires the counterweights on elevators shall be securely guarded, so that in case the wire should break and the counterweights should fall and a man should have his arm or something in such a position that the counterweight would come down and shear his arm off, the instrument would be guarded. But we find many times that there is not enough room between the counterweight and the elevator in order to guard it. So the commission has the power on appeal to it, setting forth the facts, to set aside that order as not applying to such and such elevator, and then issue a new order which will make the counterweights safe. Under the old law, and under most safety laws, I think, that is an impossibility.

Now, a few days ago I began to look over our accident records to see what has been some of the results and to see whether we were getting anywhere under our present system any more than we were under the old. We were never able to get a complete list of accidents; we do not know how many accidents were happening in the State prior to the adoption of this law, nor do we know to-day exactly how many, because every little while we learn of an accident that has not been reported. But under the system a few years ago we had reported 14,000 industrial accidents a year in the State of Wisconsin, 14,000 industrial accidents for the year 1908. Under the same system of reporting accidents for the year 1912, there were 8,000 accidents, which seemed to indicate that we had at least made a reduction of 50 per cent, or nearly 50 per cent. There were 271 fatal accidents in the year 1908, and under the same system of reporting accidents in 1912 there were 112, which meant more than 50 per cent reduction. Since the year 1912, or during the last 16 or 17 months, the accident curve seems to be running along about the same, which would seem to show that we had made about as great a reduction in accidents by safeguarding machinery at dangerous places as it is possible to make.

There has also been another movement started in the State, which seems to be doing more toward the prevention of accidents than all the safeguarding of dangerous machines and appliances that we have been able to do in Wisconsin. A year ago there were five large companies in Wisconsin—

The CHAIRMAN. Excuse me, Mr. Beck, but what was that reduction I did not get it.

Mr. BECK. From 14,000 to 8,000. You will understand, Mr. Walsh, that we never had a very perfect system of reporting accidents; but under the same system of reporting accidents we had reduced the accidents from 14,000 to about 8,000.

About a year and a half ago we had five of the large companies organize safety departments in their establishments, a department that was kept as separate and distinct a department as the purchasing department or the sales department. They put the best men they could find at the head of those departments, and one of them made a reduction in a year of 75 per cent in their accidents. The five reduced the time lost from 10,000 days to 4,000 days. Now, figuring it up at the average rate of wages paid in the State of Wisconsin, it

meant a saving of \$18,000 to those companies, or 6 per cent interest on \$300,000, which perhaps means that there is more money, when you come to figure this matter from the point of view of dollars and cents, as many of them do, and no better investment could be made than was made in that line. It cost those five establishments nearly \$12,000 to do the safeguarding which they did, and during the first year they saved \$18,000 in the loss of time and wages. One of those five establishments made an increase, and we began to make inquiry as to why that had occurred, and as near as we could find out, we do know that up until last March they had made a great decrease in the number of accidents, but a relative of the chief owner of the establishment wanted a job, and he had no other way of getting it, so the little doctor who was at the head of the safety department of that establishment was turned out and this fellow put in his place, and their safety organization fell to pieces.

Now, I believe that this is true in Wisconsin, as a result of the work that has been done, and I am led to believe that that is true from a great many letters that we get, one of which was received just a few days ago. A smokestack had blown down in an establishment in the city of Milwaukee which employed about 400 girls. It happened at the dinner hour. This employer wrote to the commission and said: "I think the Industrial Commission should adopt an order on the safety of smokestacks. Our smokestack blew down in the high wind on a certain date, and if the girls had not happened at that hour to be at dinner it probably would have killed 75 of them." There were 75 girls working at the string of machines along the edge of the factory, and the smokestack blew down lengthwise the whole length of that string, and there were about 140 girls working on those machines, and he figured from the damage that it did that it would have killed about 75. That is something we never used to receive under the old system. Employers are continually calling our attention to these accidents, and saying, "You should adopt a rule; if you had adopted a rule on such and such a case I would not have had one of my employees lose his hand," or something of that nature. And it occurs to me we might perhaps get along very well in the State of Wisconsin without any safety laws from this time on. I am pretty sure we could if it was not for about 5 per cent of the employers of the State who do not yet seem to understand the problem and how it ought to be worked out.

I believe Mr. Price will go over the educational part of our work, but if there are any questions you would like to ask, Mr. Chairman, which I can answer before yielding the floor to him, I would be glad to answer them.

Commissioner O'CONNELL. What have you to suggest to this commission? You have told us now what you have done in Wisconsin. What do you suggest to this commission?

Mr. BECK. I looked over your law coming down here. I think any problem that you are trying to solve, the best way which would occur to me to solve it would be to follow something along the line that we have done. We know it has worked in Wisconsin, and I can not see why it could not work elsewhere. In whatever problems you take up, get those people who are interested in them together to thrash them out among themselves under your guidance.

The CHAIRMAN. Are there any other questions that the commission would like to ask Mr. Beck?

Commissioner BALLARD. Would that be a national law? Would that interfere with the State law?

Mr. BECK. Of course, a national law would supersede any State law. I do not know that I would favor a national law that would supersede a State law, because I think that the National Government ordinarily is a little too far away from the places where these problems ordinarily arise.

Commissioner O'CONNELL. The law of the National Government would only apply to the District or to the Territories.

Mr. BECK. I think this commission would perform a considerable service by working out something for the State to pattern after.

Commissioner O'CONNELL. Your idea would be that this commission might work out a law to put into effect by the Government, so far as it can, as a criterion for the States to follow?

Commissioner GARRETSON. In this phase of the attitude of the employment which you referred to, as evidenced by what took place after the falling of the stack, as your experience indicated that the changed attitude of the employers may have been owing to the enactment of other laws, like compensation laws, that have shifted the economic proposition from one side to the other.

Mr. BECK. There is no doubt about the influence that that has had. At the same time, I think that the employer has largely lost sight of just what is hap-

pening in his factory, because he has gone clear out at the top, and he deals with his superintendents, and the superintendents deal with the foremen, and the foremen with the men, and I think he has gotten away from as close contact. The natural trend of industrial development tends to that thing. I know we have one employer in our State who has 375 people in a carriage factory; he used to be on our board of arbitration. He would frequently come in and talk that very problem with me. He would say, "I do not know that I should follow up my present action if I had eight or ten thousand people working under me; I presume not." But he makes it a business to know his men personally, and he will go in and say, "Good morning, John," and so-and-so, and "How is the baby to-day?" and he keeps in close touch. So he knows his entire problem. I do think that some of our employers have got beyond that so far that they lose sight of it, and when their attention has been called to it by these laws I do think in most of them there is a humane element in it which comes into operation.

Commissioner GARETSON. In other words, the humane element always enters in where the personal contact comes in and does not where the personal contact does not exist.

Mr. BECK. Yes.

Commissioner GARETSON. To many employers, then, the idea is that they are so many units, instead of so many humans?

Mr. BECK. Yes.

Commissioner WEINSTOCK. So we gather from what you have said that in Wisconsin the Industrial Commission have one set of inspectors, the State another set of inspectors, and the manufacturers' association another set?

Mr. BECK. That is true in every State.

Commissioner WEINSTOCK. You have various inspectors, then, representing different elements?

Mr. BECK. Yes.

Commissioner WEINSTOCK. Is there not friction between these different inspectors?

Mr. BECK. There is, except where a standard has been established.

Commissioner WEINSTOCK. I see. Has the State power to enforce the standards established?

Mr. BECK. Yes.

Commissioner WEINSTOCK. Can your industrial board have a manufacturer penalized if he does not comply with the standard?

Mr. BECK. Oh, yes.

Commissioner WEINSTOCK. What is the penalty?

Mr. BECK. \$10 a day forfeiture.

Commissioner WEINSTOCK. But that can only be done, I suppose, by bringing the manufacturer into court?

Mr. BECK. Yes.

The CHAIRMAN. Has the Supreme Court decided they could do that? Have they decided they have that power to assess that penalty?

Mr. BECK. Yes.

Commissioner WEINSTOCK. That is, the industrial board assesses the penalty?

Mr. BECK. No; it is a court proceeding.

Commissioner WEINSTOCK. The industrial board simply has the delinquents brought into court, and the court passes judgment?

Mr. BECK. Yes.

Commissioner WEINSTOCK. I gathered from the experience in other States, from talking with insurance men, that there is frequently a good deal of difficulty where they have two or more sets of inspectors, that one inspector will give instructions along certain lines, and then another State inspector, perhaps, will follow him and give a contrary instruction, and the manufacturer is at sea and does not know whom to obey.

Mr. BECK. I do not think it arises so much out of giving contrary instructions as it does from the fact that the State has never been able to cover more than a small percentage of the danger points in a law. Our law simply provided, as I enumerated before, and I think this is the exact language of our safety law which existed, and I think we had about as good a law as any of the States, that all bull wheels, flywheels, tumbling rods, belts, and all other dangerous machinery should be securely guarded. Now, when you come to consider that the supreme courts have held that "all other dangerous machinery" means such machinery as has been enumerated in the law; in other words, that phrase must be interpreted by taking the whole section into con-

sideration, and "all other dangerous machinery" means similar machinery to flywheels, bull wheels, tumbling rods, and so forth.

The insurance inspector will come in and find a hundred things that the law does not touch, and he will insist that those dangerous points must be guarded, because it is to the advantage of the insurance company to have every dangerous point guarded, so he is insisting on more than the factory inspector can insist upon. I think there is where the chief difficulty has arisen, but that has been eliminated in our State, and I will say that we are preparing now to accept—we do find employers objecting to so much inspection. They say here comes the fire inspector, and here comes the insurance inspector, and here comes the city inspector and the State inspector; we are simply inspected to death. They are coming, I think, more and more to look at it from the point of view that the more inspection they have the better. It costs us nothing to be inspected, they say, and we want our place safe, and it is all right. But there are a good many who are objecting to it still. We had a meeting on the 4th of December and had all the insurance inspectors doing business in the State brought together, and a second meeting will be held on the 13th of January, where we shall accept the inspection reports of bona fide insurance inspectors and use our inspectors to check up their work very largely.

Commissioner WEINSTOCK. Would you advise the State, as the result of your experience, against officially appointing the inspectors of the insurance companies to pass upon a certain standard?

Mr. BECK. Yes.

Commissioner WEINSTOCK. You would not advise that?

Mr. BECK. No.

Commissioner WEINSTOCK. What would be the objection?

Mr. BECK. You are then assuming responsibility for the acts of a private individual, and I do not think you can do that. Our experience has been such that we would not do that. We have that problem up there now, and I think we can make the insurance companies see that it is not a thing for the State officials to give authority to a private individual, something that does not owe any official relation to the parties interested.

Commissioner WEINSTOCK. Where the demands of the insurance inspector conflict with the demands of the State inspector, what would be done?

Mr. BECK. There is no necessity for that, if the State establishes the standard.

Commissioner WEINSTOCK. How does the State establish the standard in Wisconsin? Arbitrarily, or do you bring the manufacturers together and make the standard?

Mr. BECK. This committee of laboring men and employers work it out.

Commissioner WEINSTOCK. And the State simply enforces it?

Mr. BECK. Yes.

Commissioner WEINSTOCK. Subject to approval?

Mr. BECK. Of course it is really law when we adopt it.

Commissioner WEINSTOCK. Is the State of Wisconsin in the accident insurance business—has it an insurance department?

Mr. BECK. No.

Commissioner WEINSTOCK. All the casualty insurance or industrial insurance is conducted by stock companies?

Mr. BECK. Or mutual companies.

Commissioner WEINSTOCK. Yes.

Mr. BECK. We have two very large mutual companies. We have not gone into the State insurance proposition yet, because we have so many instances where employers tell us that never before have they been able to keep in such close touch with their employees as they have since the enactment of this law, where they can sit right down with the employees and figure out between the two just what is coming to him, and pay it over. But it used to be a great proposition.

Commissioner WEINSTOCK. Do they do that where they carry insurance?

Mr. BECK. Yes.

Commissioner WEINSTOCK. Or does this settlement come in between the insurance company and the employer?

Mr. BECK. No; the most of the insurance companies say if he loses so much time pay it over to him and we will reimburse you.

Commissioner O'CONNELL. How large a factory have you in Wisconsin?

Mr. BECK. The Allis-Chalmers Co. have something like 10,000 men—that is, their maximum—and ordinarily about 6,000.

Commissioner O'CONNELL. It is about 3,000 now?

Mr. BECK. No; I met the general manager the other day, and they have about 5,200.

The CHAIRMAN. You spoke of an organization of Mr. Price and others being connected with this work. What is the name of the organization on safety and sanitation which you referred to?

Mr. BECK. That relates to shop organizations for safety. We are now carrying on a campaign in Wisconsin in which we are bringing the employers to adopt safety appliances in their shops.

The CHAIRMAN. But what is the name of that general organization?

Mr. BECK. They simply call it a safety organization; it is the shop matter.

The CHAIRMAN. But is there not some general organization which is promoting that in the State of Wisconsin and elsewhere?

Mr. BECK. That is our industrial commission which is promoting it.

The CHAIRMAN. There is no organization outside of your industrial commission?

Mr. BECK. No.

Commissioner GARRETSON. And that safety organization only exists at present in the State of Wisconsin?

Mr. BECK. No.

Commissioner GARRETSON. Or is it national in its scope?

Mr. BECK. So far as the State of Wisconsin is concerned, it only exists in our State, and we are developing that by the industrial commission.

Commissioner GARRETSON. The gentlemen who represent that here are all from the State of Wisconsin, are they?

Mr. BECK. The gentlemen that we have doing that in the State of Wisconsin for the industrial commission are a part of the industrial commission.

Commissioner WEINSTOCK. Does the Industrial Commission of Wisconsin have a safety department provided by law?

Mr. BECK. Surely.

Commissioner WEINSTOCK. With a proper head to it and proper officers?

Mr. BECK. The industrial commission, of course, has the workmen's compensation to administer; it has all of the safety laws of the State to administer, and then there are certain economic investigations that are required, both by the legislature and by the commission, in order to perform some of the duties that it has to perform. So we have ordinarily divided the work up among the three commissioners. One makes it his special duty to look after the workmen's compensation side of it, and another the economic investigations to be made, and the third the safety work of the State.

I was down to Racine just a while ago at the organization of one of these safety meetings for the G. I. Case Thrashing Machine Co. They have about 3,000 employees. At a banquet the various foremen of the various departments were there, and they formed their safety committee that evening, and this watch charm was one of the things they handed out to each one of the 250 or 275 men they had there, and they handed me one, and I put it on. All the employees were given one that evening. It is not a movement, so far as we are concerned, outside of the industrial commission.

The CHAIRMAN. Mr. C. W. Price, assistant to the Industrial Commission of Wisconsin, is the next speaker.

STATEMENT OF MR. C. W. PRICE.

Mr. PRICE. Mr. Chairman and members of the commission, my superior, Mr. Beck, has spoken especially of the powers and work of the commission along the line of drafting standards covering the equipment of plants with safeguards. I am to speak especially of another duty and another power of the commission, which means this: The commission is not only empowered, but it is obligated to place in the hands of the manufacturers, the best information that it can gather from the experience of the companies that have done good work along the line of preventing accidents and making their plants sanitary and healthful.

In thinking over what I should say to-day, I have been afraid of talking too much and burdening you with too many details. I have tried to get the chairman to tell me what to do, but he will not, and Prof. Commons will not, and

so I am going to use my judgment, and I am going to try to put myself in your place and suppose I had heard what Mr. Beck had said, and that I was not familiar with the details in Wisconsin, and supposing I had heard him say here is a unique departure from what other States have done, and we have accomplished these results of less accidents and wonderful cooperation with manufacturers, and it seems to me I would go out of the room entirely unsatisfied and unconvinced if some of the more important factors which have entered into this work were not touched upon, which would explain to my mind how it all came about that the manufacturers have changed their attitude, and are now giving us cooperation. That is one of the first questions which people put to us when they come over to Wisconsin and see what we are doing: "How do you get the cooperation of manufacturers?"

The educational work is, to my mind, one of the chief factors which has entered into this work. About two years ago we began to organize an exhibit including 1,200 photographs gathered from the companies all over the United States who had done the very best work in reducing accidents. We had three of those exhibits in duplicate, and had them mounted with the cards colored, and we made a tour of the State, spending a week in each principal manufacturing town where over 1,000 men were employed in factories. Our deputies were expected to call on the manufacturers personally and interest them in having their superintendents and foremen visit the exhibit, which they did in large numbers, and in some towns hundreds of people besides the representatives of the manufacturers visited them, and they made a careful study of this exhibit of the practical results of the companies which had delivered the goods. This is no theory, but here are the facts in concrete form in large factories.

We not only did that, but on one evening of the week one of the commissioners and myself would hold a meeting, attended by the superintendents and foremen and manufacturers themselves, and we would go over the whole proposition of the prevention of accidents, placing before them somewhat in detail just how these large companies that had made reductions of from 25 to 75 per cent had accomplished it.

I remember one manufacturer met me on the train and he said to me, "Price, do you know that meeting at Janesville did more to convince the manufacturers at Janesville and my superintendents and foremen that you people at Madison are getting down to hammer and tacks, and are going to work this out along the line of experience and not theory, and along the line of good business organization than anything else, and if it did not do anything else, it certainly did do that." But in addition to that it gave those superintendents and foremen, probably not 1 per cent of whom had had a chance to see very much along the line of efficient safety work before that time, just what could be accomplished.

The second thing we are now doing, and I think it is one of the most important things, is in the line of placing practical information in the hands of manufacturers and their men, and it is to publish each month what we call a shop bulletin, which I consider one of the most valuable things that the commission is doing, absolutely. That little shop bulletin is a convenient medium which enables the commission each month to place in the hands of the foremen and superintendents and owners of the business, not what the commission thinks, but what has actually been the experience of manufacturers along the line of preventing accidents.

Here, for instance, is one of them. We usually have a special subject, and this is upon eye injuries. On this page we give some figures in regard to what the Fairbanks-Morse people have done in reducing accidents 72 per cent. Here are six accidents that might have been prevented. How did they happen? What was the disability? What might have been done to prevent them? That always interests the foreman. I found in talking to organizations of foremen, and I have talked to 150 organizations perhaps in the last year and a half, what they are especially interested in is what the other fellow is doing, not what I think, but what the other fellow is doing. What they want is experience, and I have found the thing that convinces a superintendent or foreman is what the other fellow is doing. That is the line we are working on. Not only do we include those accidents, but we always include a very brief study on two pages of some particular line of accidents. For instance, this happens to be eye injuries. There they have got the experience of 5,000 plants in Wisconsin on that subject boiled down in a nutshell, not only as to how they happened, but as to what may have been done to prevent them. Then

we include cuts of guards, the most efficient that have been worked out, and we have made a wide study of that and searched for the best, not what I think or the commission thinks, but what these companies have found to be valuable. We are sending a hundred copies of this to some factories.

Commissioner LENNON. Please see that the commission is put on the mailing list for about a dozen of them.

Mr. PRICE. Good; fine.

Commissioner WEINSTOCK. Will you put the California Industrial Commission on your list?

Mr. PRICE. They are already on.

About a year ago we made a careful study of shredder accidents especially, not of farm machinery accidents. I mention this in passing, because we do not want to forget the farmers here. We canvassed the whole situation, and I personally visited 19 men who had their hands or arms off, and got their stories, and we published a little farm bulletin telling those 19 stories, and then giving the suggestions of a number of farmers of great experience, and then the suggestions of the shredder companies and the machinery companies, as to how those accidents may be prevented.

Commissioner WEINSTOCK. Are the farmers in Wisconsin under the compensation law?

Mr. BECK. No; they are not; but there is a special law on the subject of shredders and some other farm machinery accidents.

Commissioner WEINSTOCK. Do you have compulsory compensation in Wisconsin, or is it voluntary?

Mr. BECK. Practically compulsory.

Commissioner WEINSTOCK. But the farmers are exempt?

Mr. BECK. Yes.

Mr. PRICE. Speaking of bulletins, I do not want to forget to mention another class of bulletins.

Practically all of the factories in the United States are working in the dark in the mornings and evenings of short winter days and on cloudy days. Strange to say there has been practically no information stating in good barnyard English, so that an ordinary man could read it and understand it, how shops could be lighted. There has been no standard set. Mr. Schwartz, who is connected with a company that has done the best piece of shop lighting, has prepared a bulletin on illumination; not a technically complete one, but just a practical bulletin, containing a statement of what he has found to be most efficient, and, of course, he has checked his own experience with the experience of other people. That bulletin is now in the press and will soon be issued. It is one of the most important bulletins that the commission will issue.

We are also going to prepare a bulletin on ventilation and exhaustion. At the present time there is practically nothing on that subject. We are having these bulletins prepared by men who have delivered the goods; not by men who have theories on the subject, but by men who have produced results, and they are worded, not in technical language, but in the good ordinary garden variety of English, so that anybody can understand it; and I predict that that bulletin will do more to put light into the factories of Wisconsin than anything else. The standard that is recommended there is in line with exactly what the best factories are now doing. Just what any practical, efficient man to whom you might go would say to you if you should ask him. We have had so many demands for it that we have had to send out carbon copies to companies that wanted it before we could get it printed.

The thing I want to point out especially is this, which Mr. Beck has just hinted at. I think he said it, or at least he ought to have said, that a large percentage of the accidents can not be prevented by guards. In the five years' experience we have had, during which time efficient and rigorous work has been done along the line of promoting safety in a businesslike and organized way—instead of the sporadic way in which we used to do it—it has developed out of that experience that at least some 50 to 75 per cent of the serious injuries and deaths can be prevented. That sounds like a strange statement, but our experience in Wisconsin confirms that, and I think that every man in this room who is posted on safety will confirm it. I know that the best safety men do confirm it. In our State a hundred or more companies have demonstrated absolutely that at least 50 per cent can be eliminated. But I have made a careful canvass of most of the companies, and practically all of them agree that two-thirds of the accidents can not be reached by guards. Practically no manufacturer appreciates that when he starts out. I think most of the laboring

people have no conception of that fact. Let me ask you to look for just a moment at this blue print, which represents 7,908 accidents in 13 months in the State of Wisconsin. Here you have 5,000 plants, and if you will draw a line down through there you will find that there were only 2,511 accidents that happened on machines and machine parts. Out of the 7,908 accidents, 5,400 happened through falls, slips, stumblings, handling tools, and our old friend the enemy with which we are all familiar. I do not mean to say that none of them could be reached by guards, but a great majority can not be touched by any mechanical guard.

The commission has found itself squarely face to face with that situation. If that is true, then the commission could not in any way cover the situation if it confined itself, as in the old days, to the simple inspecting of factories, the recommending of efficient guards, and so forth. That is, when the commission had gone its limit, when it had done its best in the way of factory inspection, the recommending of guards, and so forth, then two-thirds of the evil remained untouched. In covering the remaining two-thirds I think we have done the most interesting and most important thing that we have done at all. We are conducting a campaign of education. We have our deputies thoroughly trained along the line of safety organization. We spent a year in educating our deputies in the very best work that had been done; for instance, in the Illinois Steel Co., which will be represented before you by Mr. Chandler, and the work that had been done by the United States Steel Corporation, the Harvester Co., and so forth, in first-hand observation of the very best methods which have been adopted. The commission says to those deputies, "You can go into a plant, and you can find every setscrew and recommend every possible guard, and you can make an absolutely complete report, but you have absolutely failed if you leave that factory without giving the man who runs that factory an intelligent idea of safety, so that he appreciates the value of it and appreciates the important factors in it, and leave him with a good taste in his mouth, so that he is really interested in the subject of safety." We tell them that if they fail in that, they have failed. That is the thing that Mr. Beck has hammered into them over and over again, and every one of our deputies has it thoroughly in mind that the important thing is to get that manufacturer intelligently interested in safety and intelligently instructed in regard to how accidents have been prevented.

During the last year I have been calling personally upon the large companies. I have nearly finished that work in Wisconsin. In telling about this I shall have to use the first person, because that is the only way I can talk about it. I have usually met the manager, the president or vice president, the man at the top, and I have generally placed before him this blue print and a statement of the experience of the companies that have made the largest reductions in accidents. I have told him what our investigation has revealed. I show him by this blue print how accidents happen in Wisconsin. I endeavor to convince him that not more than one-third of them can be prevented by guards, and then I outline to him what we mean by a safety organization, which Mr. Beck has spoken of here. I am going to take a minute to outline for the benefit of this commission what we mean by safety organization, because you can not appreciate what we are doing unless you know what that means. I can state it very briefly.

Let me say in the first place that at the beginning practically none of the plants in Wisconsin had any systematic way of taking care of safety. It was nobody's business, and, of course, nobody did it. But this idea of safety organization is not new. It is in line with business organizations absolutely, and it is simply attending to safety in a systematic, thoroughgoing way, with some backbone and pepper, getting things done in the same way as production. Here is a simple outline of the way to reach results—I mean to reach the workmen and poor men in such a way as to keep up their interest.

First, appoint a safety committee of five high-grade men, with the superintendent as chairman, and one man, whom you might call the safety inspector, to be secretary, to attend to matters of detail.

Second, every foreman inspect his department, say, once a week and make a written report to the committee, in which he says "Everything is all right," or "The following things must be done."

Third, a foremen's meeting place once a month, at which the superintendent presides, and at which meeting the accidents that have happened are discussed and the experience of other companies is considered and the problems connected with safety are talked over. Those meetings are the most valuable part of

the organization in keeping your foremen interested and lined up. The superintendent can do more in 30 minutes by getting his men into a room together than he can do in a month visiting them separately. Our failure has been that we have not been keeping up the interest. As Mr. Search said to me the other day, "We wake up for a few days and build a few guards, and then sleep for six months, and then wake up again when the inspector comes."

The next point is a most important one, and practically every company that has made large reductions in its accidents has adopted this plan. In each department where there is hazard they appoint three rank-and-file workmen, sometimes the humblest men, and those workmen make an inspection of that department, absolutely untrammelled and with perfect freedom—in fact, being encouraged to present every possible point and make a written report to their foreman once a month. The foreman checks off the things which he himself can remedy and only the important things go up to the central committee. Those workmen at once take a new interest. They learn what you can not tell them, what that blue print reveals, but you can not tell them, which they think is buncombe. They not only inspect, but they investigate accidents, and they become the best instructors in that plant. The J. I. Case people experienced a most remarkable awakening on safety in their organization in just four weeks' time, and they had been running on dead for years. Mr. Montgomery testified that that awakening was almost wholly due to the fact that they gave their workmen something to do, whereas heretofore safety had been the boss's job. That has been our failure, gentlemen, in that we have not reached the workman because we have not given him something to do. We have not recognized him. We have really placed no confidence in him in the matter of safety. The whole policy has too long been one of secrecy and therefore of failure so far as safety was concerned. The thing to do is to turn over a new leaf and take the workman into your confidence on the deal and give him confidence and responsibility. This is a very radical departure, and in every case where it has been tried it has succeeded remarkably well.

Mr. Beck has indicated one or two results, and I want to speak of just a few to confirm what he has said. This is so new that I can only give you tentative figures, but I want to give you one or two. We took 15 companies that had organized, most of them recently, and we added up the days they had reported lost on account of accidents in the months of July and August, 1912, and the months of July and August, 1913, and to our amazement it showed that they had lost 40 per cent less days in 1913 during those two months than in the corresponding two months in 1912. We have had companies that reduced their accidents over 50 per cent in the first month. For instance, the Kimberly & Clark Co., at Neenah, were among the most conservative people on safety. They would not build guards. They have now got an organization at their Neenah plant, and during September, October, and November they had only two accidents, whereas before they had an average of 10 and 12. It so happened that 5 out of the 6 plants got into the game and organized safety committees, but the Kimberly plant, which was the most perfectly equipped physically, did not appoint a safety committee, and in the time referred to the Kimberly plant had more accidents than all the other plants put together. That company has issued one of the finest safety bulletins I know of, which goes to every workman every month.

I could tell dozens of stories like that. Now, a plan must have something in it when it appeals to manufacturers and to workmen in the way this does appeal to them and when it gets those results.

We have simply put this thing to them as a business proposition. I never tell the manager of a company that it is wrong to kill his men. I would not insult him by such a statement as that. I put it up to him as a fair business proposition, and I want to say to you that the future of safety is absolutely sure in the United States. Why? Because we have gone far enough during the last five years to have demonstrated absolutely, beyond the shadow of a doubt, what can be done, and we have demonstrated the fact that it turns out to be mighty good business organization. That explains the very marvelous development of the safety movement. Ladies and gentlemen, I thank you.

Commissioner GARRETSON. Let me ask you right there: In the State of Wisconsin, where you possibly have gone further in safety than anywhere else, would you ever have attained what you have attained without the compensation act going with it?

Mr. PRICE. Pardon me. It would have gone slower; but I have seen just as good results in States where they had no such help at all, with individual companies.

Commissioner GARRETSON. Ah, yes.

Mr. PRICE. When they once get the idea—

Commissioner GARRETSON. I grant you that, but I am speaking of it as a general proposition.

Mr. PRICE. Unquestionably that has helped in the matter of time, but I have such confidence in this thing being fundamentally right that I believe it would have come in time anyhow.

Commissioner GARRETSON. I noticed in the statement of Mr. Beck that the work of the Wisconsin commission was divided; that one commissioner has charge of safety and another commissioner has charge of compensation, and so on, but I wish you would tell, if you can, what percentage of the money now paid out by the employers under the Wisconsin act reaches the injured man. If you can not state it exactly, I wish you would state it approximately. Can you state that?

Mr. BECK. No; I know about how much the injured men are getting, and I know what the insurance cost in 1912.

Commissioner GARRETSON. I did not know but you were able to give some fairly accurate figures.

Mr. BECK. The employers of our State for the year ending December 31, 1912, paid \$1,025,000 to insurance companies for protection against accidents.

Commissioner GARRETSON. Can you tell how much money reached the men?

Mr. BECK. I will have to illustrate that in this way: We know how many accidents there were in the State and how much time they lost, and we know what they would have received had they all been under the act, as they practically all are now. You see our liability law was changed, so that they had to make the election to stay out from under the act rather than elect to come under the act?

Commissioner GARRETSON. In other words, if they stood pat they were under the act?

Mr. BECK. Yes. Also we abolished all the defenses in the last legislature, which has practically put all the industrial workers of the State under the act. Now, had that condition existed a year ago, basing the calculation upon the average amount paid to each employee as a result of his accidents and the time he lost, they would have got about \$750,000.

Commissioner WEINSTOCK. About 75 per cent?

Mr. BECK. Yes; something like that.

Commissioner GARRETSON. Whereas under the old liability conditions the proportion would have been just about reversed?

Mr. BECK. Yes; just about.

Commissioner GARRETSON. All the indications have shown that ordinarily about 34 per cent of the amount got to the injured man?

Mr. BECK. Our investigation of that subject in 1908 indicated that only about 25 per cent of the amount paid out by the employer got to the injured man.

Commissioner GARRETSON. I was giving the top limit. Thirty-four per cent is the maximum that any tribunal has brought out as the number of cents out of a dollar reaching the injured man. I did not know but that your experience might show in some concrete form what percentage now reaches the man.

Mr. BECK. I think it does, when you come to consider it for all of them.

Commissioner GARRETSON. That 75 per cent, figured in a rough way, brings it almost up to the result reached under the German Government administration. I think it costs about 32 per cent there.

Commissioner COMMONS. Eighty-five per cent goes to the injured man in Germany.

Commissioner GARRETSON. They are getting better, then. The last time I went into it the cost was something like 32 per cent.

Commissioner WEINSTOCK. In the State of Washington the State has a monopoly of accident insurance. Private companies have been driven out.

Commissioner GARRETSON. I know that.

Commissioner WEINSTOCK. One hundred per cent of the amount paid by employers goes into the pockets of the injured workmen. The cost of operation is paid out of a separate fund by the State and it costs about 8 per cent.

Commissioner GARRETSON. That is even better than I am doing under our system, where the injured workman gets 97½ per cent.

Commissioner WEINSTOCK. From your knowledge of conditions and possibilities, Mr. Price, what would you suggest that this commission do along the lines of safety? What can we do that will be effective and efficient, and how ought we to do it?

Mr. PRICE. I should say two things: First, to make an investigation which will enable you to recommend governmental bodies that may do what the industrial commission has done for the working people and manufacturers of Wisconsin, bodies national or State.

I meant to say this further thing, and I forgot it: I happened to be connected with the Harvester Co. during all the pioneer days of our safety work, and I know of the large expenditure of money and time to which we were put in order to get information. It was a very difficult thing for us to get reliable information. Do you not see the need of some way of placing this information in the hands of manufacturers and helping them. Most of them can not afford them. The large companies can. The large companies have been the first in the field. The small companies have been lagging behind.

Commissioner WEINSTOCK. Let me see if I catch your idea clearly. It is that this commission should recommend to the Federal Government the establishment of a sort of clearing house of information.

Mr. PRICE. That would be one thing. You possibly might recommend ways and means by which the State Department could be made more efficient, and so forth.

Commissioner WEINSTOCK. If we had a separate department to gather that information and redistribute it to all—

Mr. PRICE. Personally I should be in favor of a central body.

Commissioner WEINSTOCK. A clearing house.

Mr. PRICE. To put it in a general way, governmental bodies which would in some practical way place information in the hands of manufacturers.

Second, I think it will serve a very valuable purpose, and I hope my friend Campbell will bring it out strongly. I think, friends, that here is an opportunity to place before the people the facts in the case. Most manufacturers and workmen do not know the facts in the case. They do not know what has been accomplished; and they do not know how it has been accomplished. I go to manufacturers every day who do not dream of what has been accomplished, because it is so recent. Think of the service this commission could perform if they could put up in a dignified way not in so voluminous a form as to hide it away in a great big black-bound volume, but make it simple so that it will reach the foremen and superintendents and managers so that they will read it, a statement of the real situation with regard to the prevention of accidents; a statement gathered from the experience of the companies that have actually delivered the goods. If that can be done, it would have a tremendous effect.

Commissioner WEINSTOCK. You must bear in mind that the powers of this commission are limited. All that we can do is to recommend to Congress. We have no power to go out beyond that.

Mr. PRICE. I grant you that; but you could report the situation. You could say, "This is the situation in regard to accidents. This is what has been done. This is what has been found to be the cause of accidents, and these are the methods that have been adopted for their prevention." A dignified, complete report, putting it up to them, just as we have had to put it up to each manager in Wisconsin, showing the real situation, would do a great deal of good. I am going to say, friends, that it usually takes 20 minutes to convince a manager as a business proposition. The facts are so convincing that I can say that inside of a year practically every large company in Wisconsin will have a safety organization, which means that the commission will be out of business. I mean that they may make better inspections and that they will do more than we can possibly do with our deputies; and where they have an efficient organization they have practically eliminated the necessity for any State inspection. Not only do they inspect the guards but they go infinitely further and interest the men and get everybody lined up. That includes about 60 per cent of the manufacturers of Wisconsin who are now organized. That includes the most important class in the State, and so we have in sight that degree of success which justifies the statement I have made. We have been able to show them that there is something tangible in that thing as a business proposition.

Commissioner WEINSTOCK. In other words, it will follow that after you have completely succeeded you will have eliminated your whole department?

Mr. PRICE. It will go out of business. I will repeat to you that in many concerns in Wisconsin we are practically out of business, and we know we are out. We are calling off our deputies. We go and give a little advice now and then on some technical point, but we can not begin to do the inspection that they do. We could not do one-fourth of it.

The CHAIRMAN. Do you mean that you are out of business to the extent that a system of complete reports would show that the accidents are nil or reduced to a minimum?

Mr. PRICE. It is a marvelous reduction, and we find that these people are attending to that part of their business better than we could.

Commissioner BALLARD. You say that only one-third of the accidents occur because of defective machinery, and that the other two-thirds occur probably because of the workmen's own personal carelessness? Is that what we are to understand?

Mr. PRICE. Not always his carelessness. Many times his ignorance, and many times the inevitable hazard.

Commissioner BALLARD. How do you reach those two-thirds? Is it by reaching the men, or by the safety organization?

Mr. PRICE. It is through that safety organization that the man is reached. Why? Because he is given an opportunity to do something, and is given an opportunity to learn.

Commissioner BALLARD. And in that way the accidents are very largely eliminated, are they?

Mr. PRICE. It is the only way to reach them. I do not want to go too far, Mr. Chairman, and you may call me down whenever I talk too much. We find that from 90 to 95 per cent of the suggestions made by the workmen are adopted by the company. The assistant general manager of the Northwestern Railroad told me the other day that they had received over 6,000 suggestions from the workmen, and that all but 186 had been adopted by the company. That is a little better than the showing of most of the companies, but the showing is that 90 to 95 per cent of the suggestions offered by the workmen have been adopted. It is perfectly surprising what those workmen will suggest. These suggestions are along the lines of the careless practice of piling material, or carelessness in regard to the use of guards, ragged clothing, boards with nails in them sticking up left on the floor. After you have equipped your whole plant to the limit, after everything has been done which you can suggest, you will find your men making suggestions, and they will come in every industry.

Commissioner WEINSTOCK. You may have touched upon it before, but if you have it has slipped my mind. When you go to a plant that has taken no steps in the direction of safety, exactly what is your method of approaching that plant to get it organized, to show that there is something practical about it?

Mr. PRICE. I am glad you asked me that question, because it gives me a chance to make a point that I should like to make. We have in mind one thing, that unless we get the man at the top, the man with the money, it is hopeless. We have seen it tried. We have converted the superintendent, and he tried to organize, and he failed; why? Every foreman, every man down the line, knew that the boss was not there. We tried to convert him to the economic side of it first. It took me six months to get one of the most stubborn men in Wisconsin, and when we finally got him he broke loose and there was no limit to it, when we showed him the economic side.

The second thing is to have a meeting of foremen. Mr. Beck has spoken of the banquet at the J. I. Case Co. We have had banquets all over the State at foremen's meetings. At these banquets the owner of the business many times presides, and he puts himself on record in regard to what he wants and says, "Gentlemen, I have been investigating this subject. The experience of others has been called to my attention, and I am convinced that we have got to do thus and so in order to reduce accidents. I am convinced that we have not gone far enough. We have got to go beyond guards." Do you know that in every case where the boss has sat at the head of the table, when he has said, "Gentlemen, this is what we are going to do," the result has been manifested in the greater interest which has been taken by everyone connected with the enterprise. I remember that Mr. Simmons, of the Simmons Manufacturing Co., made about five speeches during the evening. Finally he said, "Boys, tomorrow morning at 7 o'clock the first order of business is going to be safety, and the second is going to be production." They got results immediately, and in every case where they have got the foremen together, and the man at the

top) has put himself on record, the results which have been obtained have been surprisingly good.

Commissioner GARRETSON. Let me ask you right there: You have just made a phrase that suggests the thought, safety first and productivity afterwards. Have you had any opportunity in a plant where it has been minimized practically to this personal equation point, to the point of human error, have you had any opportunity to study the effect of speeding up, from the material standpoint?

Mr. PRICE. My judgment would be that with the increase of speed you increase the hazard, not only because of the quick motions—

Commissioner GARRETSON. I mean whenever you pass the ordinary limit of speed.

Mr. PRICE. Not only because of the quick motion, which admits of a slip, but because of a certain psychological effect—

Commissioner GARRETSON. A result of the concentration of the mind?

Mr. PRICE. For instance, when a man on a punch press puts in 18,000 pieces a day. In the afternoon about 3 o'clock he gets so dead that then is the time when he makes a miss.

Commissioner GARRETSON. He becomes merely automatic in his motions?

Mr. PRICE. Yes.

Commissioner WEINSTOCK. Have you any data to show the percentage in establishments where efficiency systems have been put in operation as compared with plants where they have not?

Mr. PRICE. We have not.

Commissioner WEINSTOCK. Would not that be of interest?

Mr. PRICE. Very great interest.

Commissioner WEINSTOCK. As demonstrating the pros and cons?

Mr. PRICE. Yes. I was closely associated with the plants of the Harvester Co., and in one of their plants that employed 1,300 men they reduced their accidents over 50 per cent the first year, and at once it resulted in a cleaner and more orderly factory. At once it resulted in a more efficient manufacturing organization. I never heard of a plant where that result did not follow safety organization. I never heard of a superintendent who did not believe that he had a better manufacturing organization after his plant was organized. It always results in the foremen cleaning up their departments. For instance, in the Allis-Chalmers plant the first month after they perfected their safety organization they cleaned up and put a broad, red line about 4 inches wide to define the aisles, and that was the dead line over which they must not place any material. In the Harvester Co., in the Champion works especially, they raised the standard of the factory inside of a year, and it was noticeable in the increased cleanliness and orderliness of everything. It had that result, in addition to the reduction of the number of accidents.

I meant to say one another thing which slipped my mind entirely, but probably you have it in mind. In addition to the inspection and investigation of accidents, and thereby getting experience and information, great emphasis has been placed on the value of instructing the workman carefully in regard to the hazard of his job, especially the new man, and particularly the non-English-speaking man. The Steel Corporation has had that problem perhaps as much as anyone, and there they have emphasized that very strongly. I think the chairman of our commission will give details in regard to what has been done there. The plan has been adopted of personally instructing the man from the very first five minutes in regard to what the company is doing and getting the workman to do, and in showing the man the dangers of his job.

The CHAIRMAN. Have you been able to get any statistics to show how a safety organization affects production in these plants?

Mr. PRICE. It always makes for efficiency.

The CHAIRMAN. Do you mean increased production?

Mr. PRICE. Yes; I mean exactly that.

Commissioner WEINSTOCK. Are those things which you have stated the only two things which are essential to organize a plant: First, to get the man at the top converted to the economic side, and, secondly, have a meeting of foremen and a banquet?

Mr. PRICE. Outlining what I have called safety organization in my experience.

The CHAIRMAN. Are there copies of your blue print which you can give to the commission?

MR. PRICE. You can have all you want. I think we sent copies to you, but I am not sure. We are going to place in the possession of every man here everything that we have in the way of information.

STATEMENT OF MR. R. W. CAMPBELL.

THE CHAIRMAN. Mr. Campbell, we will be glad to hear from you.

MR. CAMPBELL. I do not know how much time you propose giving me.

THE CHAIRMAN. We have placed no limit on it. We simply depend upon you gentlemen, each one of you having heard the other, not to duplicate, but to give us what you think you can right upon the question as to what this commission can do under the law on the question of safety and sanitation. I think that is the idea.

MR. CAMPBELL. It has occurred to me, Mr. Chairman and members of the commission, that in order to get at the problem that confronts the commission it might be advisable for some of us who have had something to do with the working out of the problem in recent years to place before your minds and within your view that which has been done, the development that has taken place, and with that idea in view I have aimed to frame my remarks. If that does not meet the pleasure of the commission, I shall be glad to have you say so now, and I will talk along other lines that will suit your pleasure better. But it seems to me that you gentlemen who probably have not been familiar with the work of the movement as it is on foot to-day that you probably would like to have a little analysis of it put before you. Therefore in order properly to understand what the accident-prevention problem is I will say that it is first essential to understand what the kinds of accidents are.

In speaking of accident-prevention work let me say, by way of parenthesis, that I think we who are dealing with the problem—I think the gentlemen in Wisconsin include that—include as well the allied subjects of sanitation and general matters relating to betterment of conditions, personal conditions of the men, you might say, which affect their working ability. In other words, all of the interrelated items, such as sanitation and betterment of working conditions of all kinds, are included.

Accidents divide themselves into two general classes—the nonpreventable or the so-called trade risks and the preventable accidents. I believe, and I think others agree with me, that the nonpreventable accidents amount to about 10 per cent of the number of accidents in the most hazardous of trades and run down to a very small fraction of 1 per cent in the less hazardous occupation, leaving 90 per cent of the accidents that occur in the country as preventable accidents. This can lead to but one conclusion—that if 90 per cent of the accidents are preventable we ought to get busy and prevent them. I venture to quote to you the old worn out figures that have been used so many times during the past few months, showing the number of accidents that, even in the face of what has been done, are occurring in our country to-day. Our statistics are not reliable. There are 35,000 men killed in the industries of our Nation to-day and 2,000,000 injured every year. I will not make the divisions and subdivisions by days and hours, but you can see that it is an appalling indictment upon the lethargy and indifference of the powers that be and of the men themselves to find that awful list of casualties occurring every year, and it therefore means that something must be done. Something has been done, but the bark has only been scratched as yet.

What are the causes of these 2,000,000 injuries and 35,000 deaths? To get at the problem we should analyse it from that point of view first.

The causes are first the failure of the employer to provide and maintain proper working conditions, proper and efficient safeguards on dangerous machines or appliances, and, secondly, the ignorance or carelessness of the men themselves. There are two broad divisions—the duty of the employer and the duty of the employee.

That in a broad way presents what the accident prevention problem of to-day is and how it should be met. The first duty should be met by the employer assuming the obligation that falls to him naturally of providing proper working places and proper and efficient safeguards on dangerous machinery and appliances; and secondly, the duty of the men to assume their obligations of carefulness on their part. And in this second element there is a further duty on the part of the employer himself, which is to see that his men do assume that obligation, to see that they know what it is, and to see that it is properly

pointed out to them. So the employer has two duties then—to make conditions safe and to educate his men and to inculcate in them habits of caution.

The employee has one duty—to try to be as safe for himself and his fellow workmen as he can. To accomplish all of this, as Mr. Price has pointed out and as Mr. Beck has pointed out, the men engaged in all those industries that have made any study of the matter have concluded definitely that it is absolutely essential to have a definite yet comprehensive organization which will make out and carry out a definite and comprehensive plan.

We might stop for just a minute and consider what has been done in the meeting of this problem up to to-day, and I will draw your attention to the three phases of the work—that which has been done by the industries, that which has been done by the States, and that which is being done in the matter of public safety, so called.

First, as in all great movements—and I believe frankly, gentlemen, that to-day there is no greater movement afoot than the accident prevention movement—as in all great movements, the initiative has been taken by and through individual efforts, and to-day the work which has been accomplished has been that of the individual industrial concern. There are many of them that have been for a great many years, dating back at least five years, actively engaged in coping with these problems. Among these, I would like to call your attention to a few, if it will be in order, Mr. Chairman, so that you may get an idea of the kind of concern that has been dealing with it:

The General Electric Co.
 The National Harvester Co.
 The Remington Typewriter Co.
 The Eastman Kodak Co.
 American Steel Foundry.
 Inland Steel Co.
 United States Steel Corporation and its subsidiary companies.
 The Crane Co.
 The Cleveland Cliffs Iron Co.
 Pfister Vogel Co.
 Youngstown Sheet & Tube Co.
 Fairbanks-Morse Co.
 Chicago & North Western Railway Co.
 Elgin, Joliet & Eastern Railway Co.
 New York Central Lines.
 Pennsylvania Railway Co.
 Baltimore & Ohio Railroad Co.
 Union Pacific and Southern Pacific Railway Cos.
 Santa Fe System.
 Frisco Line.
 Chicago City Railways Co.
 The Brooklyn Rapid Transit Co.

The Interborough Rapid Transit Co. and many others—a long list of them. I would not venture to say how many have been doing work more or less satisfactory and more or less organized, but it has been here and there and sporadic, some in Wisconsin, some in Illinois, some in New York, and some in Pennsylvania. There has been some work done, too, through manufacturers and trade associations through discussions of safety problems at their annual meetings, and through the work of the central committees on safety that they appoint. There has been a good deal accomplished and a good deal of missionary work done through the activity of the various insurance companies through their inspection and other departments. There is an organization in the city of New York known as the American Museum of Safety, which is providing a safety museum in that city, it is under the able direction of Dr. Tolman, and it is providing information there for those who can avail themselves of it.

If I may take just a minute or two, it might interest you to know some of the details of the manner of approaching this problem of some one of the large industrial concerns. It has been my privilege to have been connected with this work in the Illinois Steel Co., one of the subsidiaries of the United States Steel Corporation, for the past five years, and naturally I am more familiar with that phase of the work of that company and that corporation than with others; and, if I may be permitted, I would like to briefly outline to you how that company and that corporation have attacked the problem.

In the first place, for over 20 years the different plants of the Illinois Steel Co., of which there are five—three of which are employing from 5,000 to 10,000

men annually, and the other two are employing from 1,500 to 3,000 on an average each year—have each had what we call safety inspectors, who were members of a little side department that was clothed with two functions—that of inspecting dangerous conditions, and that of making settlements with the men when injured. Those departments ran along for some 15 years, and very little was accomplished. We had safeguarded, it is true, but we have not touched the problem as yet. It occurred to some of the officers of the company about five years ago, that we might do something by getting the representatives from our different plants together and conferring upon this problem, and, as a result of that thought, a central committee of safety was organized which is composed of two representatives from each of those five plants, the assistant general superintendent, the man in direct charge of the operating details of the plant; the safety inspector of the plant; and it is presided over by myself as the executive officer—not being connected with any one of the plants—I being in the law department of the company and thus being the presiding officer over our committee. That committee for the first four years met every two weeks. It studied every accident that happened at any one of the plants; it undertook the task of standardizing safety appliances and safeguards in the various plants of our company. It undertook the preparation of various operating rules in the plants. It adopted rules regulating the use of dangerous explosives. It considered ways and means of interesting the men, and it adopted various schemes for that purpose, most of which have been put into effect.

Now that committee has working under it and as a part of its organization at each of the plants, and we will just take up one plant—which will be a fair example of all—a plant safety committee, composed of the assistant general superintendent as chairman and the safety inspector as secretary, and from four to five or six department superintendents, each of the plants having a separate department such as blast furnace, rail mill, and yard, etc., and taking superintendents from those several departments and putting them on the plant safety committee.

Under and still going out fan like, under that committee at the plants are two committees of workmen. In one of them the membership is changed every two or three months—three months I think it is now—and the plant is divided up into divisions, four or five divisions, and workmen below the grade of foreman are selected to go upon that safety committee. Once a week that committee makes an inspection of the departments within the division from which they are taken, and makes its report to the plant safety committee. There is contemporaneously with this committee what we call a department or permanent committee, consisting of foremen in each of the departments. These foremen serve continuously, and once a month they make inspections of their departments, reporting to the plant safety committee.

In addition to this duty they investigate every serious accident which occurs in their department. They talk to the witnesses and view the spot where the accident occurred and make a thorough investigation of it and report to the plant committee what their findings are with respect to that accident, what the cause of it was, who was to blame, and if they can recommend anything to prevent the recurrence of that accident or a similar one they so report. If they believe anybody was guilty of negligence they find him guilty and recommend what discipline should be meted out to him. We find this a very valuable asset to us in the safety work we are doing in the company.

In addition to this work the central committee is served by what we might call side committees or special committees. If there is a special electrical problem which comes up we have a committee of the electrical engineers of the several plants which meets every quarter or so, or on the call of the chairman of the central committee to act with it, and there are submitted any technical electrical problems. If there is any technical blast furnace problem it is likewise submitted to them, and so on. In that way we have been able to get from each plant its best experience, its best thought, and the best ideas, and make them applicable and available to every other plant through our central committee, as a sort of clearing house and standardizing body. Recommendations which are made by our committee are never considered until they have been reported back to the plants and the plants themselves have considered them, so that before we act we have had the matter reported to the experts at each one of the five plants.

Similarly, that same form of organization is carried into the Steel Corporation, in that about simultaneously with the creation of this central committee

in the Illinois Steel Co. a similar committee was organized in the corporation, consisting of the representatives of the several subsidiary companies, and each of these companies sends in to it similar data and information, which is by that central committee disseminated through all the other companies, and thus the whole corporation gets the benefit of the thought and advice and experience of every plant of every company that composes the large organization.

Commissioner WEINSTOCK. Does your company publish literature which tells the story you are telling us?

Mr. CAMPBELL. I think there are some bulletins out now. I have before me now a pamphlet which is a much lengthier statement of the situation which I made at another time in a more formal address than I have made to-day.

Commissioner O'CONNELL. The Steel Corporation furnishes them, does it not? I just got one of them this morning.

Mr. CAMPBELL. I had thought of going into some of the educational features, among which is this bulletin. Through these organizations we have taken up the task of trying to educate our workmen to be more careful. These books of rules I have mentioned have been printed in 14 different languages, and they are placed in the hands of every workman in the plant, and every new workman is presumed, I will say—though of course there are times it is not done, through carelessness of somebody—to be instructed in those rules, at least those applicable to the particular job he is put upon. And the various means of interesting the men and educating them are also adopted. We have bulletin boards around the plants and we have mottoes on shop slips, and so forth, and moving pictures are shown from time to time when we can get the men together, and each of the companies, at least the Illinois Steel Co., is now issuing itself a monthly bulletin; and the Steel Corporation is issuing a quarterly bulletin in which all sorts of accident information, for the benefit of the several companies, is gathered together and prizes of different sorts are given to the men in a department if they are able to keep within a certain limit with respect to the number of accidents.

Foremen are examined on these safety rules, and if they are able to pass a thorough examination are given a safety button with "Safety first; boost for safety," upon it. And a thousand and one schemes that I do not want to take your time to enumerate in this allotted time, which I feel is short enough, to tell you about. But we are going at the educational problem in a hammer-and-tongs way, because we believe, as Mr. Price has said, that about 55 or 60 per cent of results accomplished are due to the interesting of the workman himself. It is a hard job to do that. He, of course, must interest himself somewhat, but it is our job, as his employer, to make him realize the importance of it. So we are going at that phase of the work in this organized way, which is the real purpose of the organization, to interest the men themselves in that way for that very purpose.

Commissioner WEINSTOCK. In other words, your aim is to bring the pressure to bear from within rather than from without?

Mr. CAMPBELL. We are trying to have everything start from the bottom, because we believe if the man thinks he thought out a thing himself, he will do it. That is one of the reasons in our committee that we pass everything back. All this work in the Illinois Steel Co. has been in a way satisfactory. We have not reached the goal that we would like to, but this concentrated and organized effort has resulted in a reduction of 66 $\frac{2}{3}$ per cent of our accidents. It has resulted in one plant in a reduction of over 71 per cent in the number of accidents. And all that makes us feel, and makes us feel very positively, that organized effort along educational lines is the sine qua non in accident prevention work. But I must pass on—

The CHAIRMAN. If this is a convenient place to pause, and if you will be good enough to continue your remarks after luncheon, we will adjourn.

Mr. CAMPBELL. This will be a very good place for me to stop.

The CHAIRMAN. It is suggested that we adjourn now until 2 o'clock.

(Whereupon, at 12.50 p. m., a recess was taken until 2 p. m.)

AFTER RECESS.

The commission met pursuant to adjournment at 2 p. m.

The CHAIRMAN. The commission will come to order. Mr. Campbell, will you proceed.

Mr. CAMPBELL. At the hour of adjournment I was directing your attention to the work of the Illinois Steel Co. and the United States Steel Corporation.

I find that there are one or two other things in connection with their work that might be of interest, which I have neglected to state, some of our outside work, you might say, in this, that in one of our plants we have aimed to get the cooperation of the community. Where this is feasible in the smaller communities it would seem, from the results we have attained, that that might be a practicable method of approaching the problem.

Our method was this. We called together the clergy and the newspaper men of the community at a dinner and we laid before them our problem. We tried to point out where they could be of assistance to us by encouraging cooperation through the members of their parishes who might be in our employ or in the employ of other industries in the community. We have distributed safety calendars in the homes of the families, on the tabs of which are different safety mottoes. We have in conjunction with the street railway company of that particular community caused safety lectures to be delivered to all of the school children in the community, pointing out particularly the danger in the industry and in the use of the public streets and public conveyances, in the way of street cars. We have found from all three of these outside endeavors very satisfactory echoes. We find that the men, where we are approaching this thing in a continuous and organized way, are really bearing the matter in mind.

One little instance may evidence that fact. A couple of our men were attending a street carnival that was going on in that city, and there was one of these loosely-constructed Ferris wheels in operation at that street carnival. One of the men suggested to the other "Let us take a ride." The other said, "Oh, no; safety first, Jim." And we get little echoes of that kind. Men have reported to us what their children have said to them at home, etc., showing there is no limit to which you can go and ought to go in the organized effort to make everybody appreciate the importance of the work.

At this same plant and at some of our other plants, we are also trying out another plan. We have what we call a plant preacher, who is a man who speaks as many different languages as we can find in any man that may be available, and this man spends his entire time going around the plants with names obtained from the timekeeper of new men, and approaching them at their work and talking to them in the language that they understand, explaining to them the company's attitude toward safety, and discussing with them what their knowledge is of the hazards peculiar to their particular employment at the time. If he finds that they do not understand, he brings the foreman over and interprets for the foreman, and lays the problems of that particular individual before that foreman and tries to see that that man is thoroughly cognizant of the hazards of his job. We are finding that that is a very helpful way of approaching the problem.

So much in the individual industrial activity. It may be said, and I think it should be said, that there are a large number of other companies who are approaching the problem in much the same way, with possibly some differences of details. I do not mean to have you infer that I think the Steel Corporation or its subsidiary companies are the only ones who have done anything. I am only citing those as the ones with which I am more familiar with the work. There have been other lines of activity than those I have already mentioned, notably in the State departments, the work of one of which you have had explained to you this morning. There are other States which are approaching the problem in the same broad-minded, comprehensive, and instructive way that the State of Wisconsin has approached it. Among these States you will find that Pennsylvania, New York, Ohio, California, and Minnesota, at least, are at work, or starting at work along these comprehensive lines, and there is no telling what the result of that increased activity in the State departments may bring forth. There has been very recently started an additional movement which you might call the public-safety movement. I think it had its initial inception in the action taken in the city of Chicago by the coroner of Cook County, who appointed a commission voluntarily, which commission has undertaken the task of trying to correct many of the public dangers and evils incident to the use of the public streets. They have done many educational things, and they have talked to the school children and distributed leaflets throughout the city; have had moving pictures exhibited showing the dangers incident to the use of street cars and the use of the streets, and are entering upon rather a large propaganda of education as to public danger. This includes, of course, the allied danger in the home. When you stop to think of it, you would be rather appalled at the large number of

accidents that are daily occurring in the homes. We trip over a rug; we wear high-heeled shoes and tight skirts and fall downstairs; we lean against an unsecured railing on the back porch and go over on the back of our neck; and in the kitchen we wear a flimsy dress in front of the gas stove and catch on fire; and we will handle some hot grease and get some water on it and have it spattered into our faces. All of these things show the possibilities of an organized educational campaign; and that is, in a sense, the position that we find ourselves in to-day and the real necessity of the occasion.

I would like to direct your attention, having now briefly outlined to you the activities that are at work and what has been done in a way, to what I believe to be a few of the lessons that we have been able to learn from the experience we have had in the past five years.

I would first again remind you of the fact that accident-prevention work is practical work. The fact that the industries that have engaged in it have been able to reduce their accidents anywhere from 33½ per cent up to 72 or 75 per cent shows conclusively and beyond peradventure that it is a practical work and brings results and saves human lives.

Again, we have the proven fact that it results in economy. The saving of the cost of compensation alone, as has been adverted to once or twice here, is a great economy to the industry which would have to pay compensation if the man were injured. How much more, however, of an economy is it to a man himself who is able fully to earn his daily wage? He does not lose anything; he is left with his family; and there is no social or civic loss or waste when that man is maintained at his work. Every time somebody is injured, aside from the injury and loss to the man himself, nine times out of ten the community is also called upon to participate in that loss, to help support the family if the man is in poor circumstances, as nine times out of ten he is. There is likewise another economy which should not be forgotten. There is never an accident happens, except a very rare one, which does not at the same time it destroys human life or injures the person destroy or injure the property of the employer; the machine is broken at the time the injury occurs; it may have to be entirely replaced, according to the seriousness of the accident, resulting in great waste and lack of economy. There is likewise a loss of product that follows and is entailed by the injury at the time it occurs. Then, in the broad sense as affecting efficiency, we find that accident-prevention work is an adjunct to increased efficiency. By that I do not mean by speeding up a man to the highest possible point of work, but I mean the ordinary average working out of the day's product in the plant. A man is injured and a new man has to be put in his place, and it may take days to train him to do that work without loss to the particular product. At the time the injury occurs all those surrounding the men are brought to the scene of the accident, and the disintegration of the working force is really beyond computation. We do not know, we can never compute just how much of a loss of efficiency arises right there. If the accident has been at all gruesome in its character the men go away from it and are unnerved for the balance of the day, and the loss of product to the plant is unmeasurable. And in some industries where death occurs the plant shuts down for the balance of the day, and in some industries, I am told, the men do not go back to work until after the funeral.

Now all of that undoubtedly results in waste economic loss, and inefficiency, and if that can be prevented, the reverse is true, and we do have a resulting economy and increased efficiency in our plants every time we prevent an accident and the injury or death of a man. Now all of that points inevitably to the fact that Mr. Price suggested that the accident-prevention work has come to stay. The manufacturer, the industrial plant of to-day is bound ultimately to realize the fact that accident-prevention work is going to be money in their pockets. When you can make them realize that, and when they do begin to realize that, then we will have an immense wave in this move.

I think it is needless to suggest to thinking people or to more than suggest that it is, of course, one of the highest forms of humanitarian efforts that we can make. It is a work that can not help but benefit humanity at large and in particular. And any work that is humanitarian is a work that is really worth while.

Looking at the problem again in another way, we find that there is an absolutely essential element in it, and that is cooperation. This is in a way a day and age of cooperation. We find it existing to the right and left of us, but nowhere is it of any more importance than it is in accident-prevention work. The employer and the employee must actually and actively be hand in

hand in the work and the employee may be as interested as he can, but unless his employer is vitally interested and seriously and sincerely so, to the end that he will provide the safeguards and permit the employee to think of safety, you can not get anywhere. And I think right here it might be well to correct in your minds, if you have had the impression, what I have felt has been a misapprehension or a misdirection of argument, if that may be a way to express it, that has gotten into the minds of many. When we analyze this problem we say that we must safeguard and we must overcome the carelessness of employees, and it looks as though we were throwing a large burden and making an accusation against the employee. Now, I say and I believe, it is the consensus of opinion of men who have been speaking about it, that we have no right to blame a man in a plant where his employer will not turn his hand over. Let us put the blame where it belongs. The employer must first participate in this movement, he must first be interested, and his cooperation is the first and the essential element. After you have that then all of this work is necessary, and the cooperation of the employee is a necessity.

Again, all this has led to another conclusion in the minds of those who have been active in the work, and that is, that there has grown up the need, the absolute need, of some coordinating or federating agency which could properly direct and stimulate all of this scattered effort that has been made throughout the country. We find an industry here and an industry there, one State and another State to the east and the west all acting independently and with little relation to the work of the other. There has been felt the need of having some organization which could provide information respecting what has been done, what may be necessary to be done, and how to go about it if you are interested in going about it. Those industries that have been engaged in the work, many of them have almost every day in the year within recent years been receiving requests for information and data from other concerns that were feeling their way or considering going into the problem. And we have found that aside from those who have asked already there have been a very much larger number who have been diffident about asking, they do not like to go to one of their competitors and ask him for information about this or that, or to go to somebody else who they may never have met and ask what have you done, will you turn over to me all the experience you have had for the last five or six years. They have a hesitancy about it, and so much so that there is a story told of a man going to the American Museum of Safety, where there was a gear guard exhibited as a model, with his drawing board and measuring instruments, and measuring off and spending four or five hours taking down the measurements and making a draft of this guard on his board, and when asked why he was doing it and why he did not inquire of the company that furnished the device to the museum, he replied that he was ashamed to do it. That ought not to be. But in face of that and in face of the need of some organization to do that, and in the face of a further need growing out of the fact that so little has really been done by many large industries and by practically all of the smaller ones, there is a wide need for a campaign of publicity or an educational propaganda.

Therefore, it was felt at some agency which could provide all of this and which could undertake the provision of standards in the way of safeguards and safety rules and regulations which might be a guide to the industries of the country and to such State departments as might wish to and thus overcome a good deal of the confusion which exists and which has been suggested here by a recommendation of one side being made by one inspector and another respecting the same thing by another, and so on, which could undertake the provision of standards and which could hold under its auspices annual meetings for the purpose of discussing prevention customs and which would also promote local activity and local meetings and safety promotion in the different communities and geographical districts—all of this need, I say, has been felt for a number of years. It found expression a little over a year ago in an action taken at a meeting of the Society of Iron and Steel Electrical Engineers held at Milwaukee, which organization had held under its auspices a safety congress which lasted three or four days and which was very widely attended by all the expert safety men in the country, and at that meeting a committee was appointed to consider the ways and means of devising an organization which would fill this need. That committee during the year had many meetings, and as a result of its deliberations the National Council for Industrial Safety was organized.

The formal organization of it took effect just three months ago. I happen to have the honor of having been elected its first president, and it is partially in that capacity that I am before you to-day.

The organization has very large and comprehensive objects. I will not stop to quote them to you. I am going to have placed in your hands a copy of this little pamphlet that will give you much of that information, if you care to look it over more in detail later. The objects are sufficiently wide and comprehensive to permit of all of the activities, the need for which I have suggested.

The membership in the organization is open to any and every one who has any interest whatever in the conservation of human life and limb. The dues for members are moderate, and for industrial concerns have been placed on a sliding scale on the number of men employed, so that the smaller industry that wishes to take advantage of such benefits as may accrue from membership in it can do so on a properly comparable basis with the larger industries.

So that you may know a little something of the character of the organization and the real strength that we believe is in it, if you will bear with me, I would like to read to you a few of the names of some of the members, unless you feel that you prefer not to have me take your time to do that.

The CHAIRMAN. I think that was what Mr. Garretson wanted.

Commissioner GARRETSON. Yes.

Mr. CAMPBELL. I will say in general that all of the large manufacturing concerns that have done anything in this work are members of this organization, and that the large insurance companies and public-spirited men, bureaus of labor, labor leaders interested in the work, etc., are members of our organization. I am going to have placed before you a complete list of our directors and a list of the members of the executive committee, which is in the back of this little pamphlet.

Mentioning some of the members, first we have a great number of organizations like the American Museum of Safety, the Illinois Manufacturers' Association, and a number of the other trade organizations. Among the large industrial companies we have the Aetna Life Insurance Co., Mr. M. W. Alexander, of the General Electric Co., which company is also a member of the organization; the American Mutual Liability Insurance Co., the American Car & Foundry Co., the American Steel Foundries, the Pullman Co., through one of its representatives; the Avery Co., of Peoria, Ill.; the Bethlehem Steel Co., David S. Beyer, of the State of Massachusetts, the manager of their compensation department, whose exact title I have forgotten; the J. G. Brill Co., of Philadelphia, the Brooklyn Rapid Transit Co., the Brown & Sharp Manufacturing Co., of Providence; Mr. John Calder, whom some of you may know as one of the later authorities on accident prevention work; the J. I. Case Threshing Machine Co., the Chicago & North Western Railway Co., the Commonwealth Steel Co., the Dodge Manufacturing Co., the Eastman Kodak Co., the Fidelity & Casualty Co., of New York; the Ford Motor Co., the General Accident Fire & Life Insurance Corporation, the General Chemical Co., Harrison Bros. & Co. (Inc.), of Philadelphia; Dr. Frederick L. Hoffman, of the Prudential Insurance Co.; Dr. J. H. Holmes, of the Bureau of Mines; the Inland Steel Co., the International Harvester Co., Dr. John Price Jackson, commissioner of labor and industry of the State of Pennsylvania; James A. Kennedy, who, I believe, is commissioner of labor of the State of Michigan; Hon. Charles C. McChord, Interstate Commerce Commissioner; the New York Central lines, Pennsylvania Steel Co., the Pfister & Vogel Leather Co., the Peoria Railway Co., the Simmons Manufacturing Co., Swift & Co., the packers; the Union Pacific Railroad Co.; the Vulcanite Portland Cement Co., the subsidiary companies of the United Steel Corporation and that corporation; the General Electric Co., the Independent Inspection Bureau, several members of the workmen's compensation bill, the New Jersey Zinc Co., the National Association of Tanners, Sears, Roebuck & Co., the Standard Steel Car Co., and a large number of others. Our membership to-day is approaching 300.

The form of organization is simply this: The general direction of affairs is in the hands of a board of directors, 75 in number, which meets annually and elects an executive committee of 15, which is charged with the direct responsibility of managing the affairs of the national council. I have here a list of our directors, which is as follows:

R. W. Campbell, chairman, central safety committee, Illinois Steel Co., Chicago, Ill.

W. F. Houk, commissioner of labor, Minneapolis, Minn.

Edgar T. Davies, Chicago, Ill.

G. L. Avery, secretary Avery Co., Peoria, Ill.

- Lewis T. Bryant, commissioner of labor, Trenton, N. J.
 J. D. M. Hamilton, claims attorney Atchison, Topeka & Santa Fe Railway Co., Topeka, Kans.
 John Kirby, jr., president Dayton Manufacturing Co., Dayton, Ohio.
 Thomas Lynch, president H. C. Frick Coke Co., Pittsburgh, Pa.
 Dr. F. D. Patterson, director of safety, Harrison Bros. & Co. (Inc.), Philadelphia, Pa.
 Hon. C. P. Neill, American Smelting & Manufacturing Co., New York, N. Y.
 David Van Schaack, director bureau of inspection and accident prevention, Aetna Life Insurance Co., Hartford, Conn.
 L. B. Robertson, Ford Motor Co., Detroit, Mich.
 H. H. Laughlin, Jones & Laughlin Steel Co., Pittsburgh, Pa.
 Hon. C. C. McChord, Interstate Commerce Commission, Washington, D. C.
 William F. French, member Industrial Accident Board of California, San Francisco, Cal.
 W. A. Layman, president National Metal Trades Association, St. Louis, Mo.
 George W. Simmons, Simmons Hardware Co., St. Louis, Mo.
 F. W. McKee, Fairbanks-Morse Co., Beloit, Wis.
 Robert J. Young, manager safety and relief department, Illinois Steel Co., Chicago, Ill.
 Charles Piez, president Link Belt Co., Chicago, Ill.
 W. J. Olcott, president Oliver Iron Mining Co., Duluth, Minn.
 Dr. L. W. Chaney, Bureau of Labor, United States of America, Washington, D. C.
 E. H. Carey, president American Iron & Steel Institute, New York, N. Y.
 W. B. Spalding, chairman central safety commission, Frisco Lines, St. Louis, Mo.
 J. A. Robinson, chairman central safety commission, Eastman Kodak Co., Rochester, N. Y.
 Marcus A. Dow, general safety agent, New York Central Lines, New York, N. Y.
 Bison S. Lott, president United States Casualty Co., New York, N. Y.
 J. F. Robison, assistant secretary American Car & Foundry Co., St. Louis, Mo.
 J. H. Patterson, president National Cash Register Co., Dayton, Ohio.
 John Calder, president International Motor Co., New York, N. Y.
 Dr. W. H. Tolman, director American Museum of Safety, New York, N. Y.
 G. G. Crawford, president Tennessee Coal & Iron Railroad Co., Birmingham, Ala.
 Dr. A. M. Harvey, Crane Co., Chicago, Ill.
 J. W. Mapel, Pfister & Vogel Leather Co., Milwaukee, Wis.
 Howell Chaney, Chaney Bros., South Manchester, Conn.
 Claude Taylor, president Michigan Federation of Labor, Grand Rapids, Mich.
 Dr. J. A. Holmes, Bureau of Mines, United States of America, Washington, D. C.
 G. A. Ranney, secretary International Harvester, Chicago, Ill.
 H. D. Sharpe, treasurer Brown & Sharpe Manufacturing Co., Providence, R. I.
 S. J. Peterson, acting safety agent, Union Pacific Railroad Co., Omaha, Nebr.
 T. E. Gaty, secretary Fidelity & Casualty Co., New York, N. Y.
 Ed. E. Adams, Cleveland Hardware Co., Cleveland, Ohio.
 R. C. Richards, chairman central safety commission, Chicago & Northwestern Railway Co., Chicago, Ill.
 P. C. Schweltman, vice president and general manager Racine Sattley Co., Springfield, Ill.
 H. M. Wilson, Bureau of Mines, United States of America, Pittsburgh, Pa.
 L. R. Palmer, chairman safety commission association of Iron & Steel Electrical Engineer, Pittsburgh, Pa.
 Z. G. Simmons, president Simmons Manufacturing Co., Kenosha, Wis.
 Arthur Williams, president Edison Electric Co., New York, N. Y.
 E. G. Trimble, manager Employers Indemnity Exchange, Kansas City, Mo.
 Arthur T. Moray, assistant to president Commonwealth Steel Co., St. Louis, Mo.
 M. W. Alexander, General Electric Co., West Lynn, Mass.
 C. L. Close, manager bureau of safety relief and sanitation and welfare, United States Steel Corporation, New York, N. Y.
 S. W. Taner, manager casualty department, American Steel & Wire Co., Cleveland, Ohio.
 W. T. Moulton, Cleveland-Cliffs Iron Co., Ishpeming, Mich.

Lancaster Morgan, treasurer General Chemical Co., New York, N. Y.

F. L. Hoffman, statistician Prudential Life Insurance Co., Newark, N. J.

T. D. Williams, president Brooklyn Rapid Transit Co., Brooklyn, N. Y.

Melville W. Mix, president Dodge Manufacturing Co., Mishawaka, Ind.

J. C. Adderly, secretary Millers Mutual Casualty Co., Chicago, Ill.

J. B. Kennedy, Industrial Accident Board, Lansing, Mich.

David S. Beyer, manager accident prevention department, Massachusetts Employees' Insurance Co., Boston, Mass.

Rose C. Purdy, research engineer, Norton Co., Worcester, Mass.

J. B. Douglass, manager claim department, United Gas Improvement Co., Philadelphia, Pa.

C. W. Price, assistant to Industrial Commission of Wisconsin, Madison, Wis.

There should be added to that list, although their names have been omitted, the name of Mr. Julius Kruttschnitt, chairman of the executive committee of the Southern Pacific Railway Co.; Douglas Fisk, of Minneapolis; and W. H. Cameron, our secretary.

Among the men who are the directors of the council you will find practically all the men in the country who have been interested in safety work and who have been interested in public movements generally. It is a broad and comprehensive list of able men who have been willing to cast their lot with the organization and share some of the responsibilities of its activity.

The executive committee, as I have stated, is in direct and responsible charge of the activities of the organization, and you will find the names of that executive in the back pages of this pamphlet. They are as follows:

Mr. Robert W. Campbell, chairman central committee of safety, Illinois Steel Co., Chicago, Ill.

Mr. Lew R. Palmer, assistant commissioner labor and industry, State of Pennsylvania, Harrisburg, Pa.

Mr. Ralph C. Richards, chairman central safety committee, Chicago & North Western Railway Co., Chicago, Ill.

Mr. Edwin R. Wright, Chicago, Ill.

Mr. G. L. Avery, secretary Avery Co., Peoria, Ill.

Mr. David Van Schaack, director bureau of inspection and accident prevention, Aetna Life Insurance Co., Hartford, Conn.

Mr. Robert J. Young, manager safety and relief department, Illinois Steel Co., Chicago, Ill.

Mr. Charles Piez, president Link Belt Co., Chicago, Ill.

Mr. Ferd. C. Schwedtmann, vice president and general manager Racine-Sattley Co., Springfield, Ill.

Mr. H. M. Wilson, Bureau of Mines, United States of America, Pittsburgh, Pa.

Mr. E. G. Trimble, manager Employers' Indemnity Exchange, 706-708 Commerce Building, Kansas City, Mo.

Mr. Arthur T. Morey, assistant to president Commonwealth Co., St. Louis, Mo.

Mr. Charles L. Close, manager bureau of safety, relief, sanitation, and welfare, United States Steel Corporation, New York, N. Y.

Mr. Charles W. Price, assistant to Industrial Commission of Wisconsin, Madison, Wis.

If you will examine that list you will find that, with the possible exception of the president, they are all men who have been actively and energetically engaged in some form or other of accident-prevention work during a large number of years. They are men who know the accident-prevention problem as it is, and know what ought to be done in connection with it, as we believe. We feel that we have gathered together here in this executive committee possibly the best intelligence and the best ability for handling the problems as they may be presented in connection with accident-prevention work that are available in the country. It is not a fancy committee. There are none of us who have fancy names. We are all of us simply hard-working men actively in the field, doing the kind of work that the council is trying to promote and direct.

It is a satisfaction to me to be able to state that at nearly every one of the meetings of this executive committee there have not been more than one or two members of the committee who at any one time have been absent. You will see that they are gathered from all over the country—some from Philadelphia, some from New York, some from Pennsylvania, some from Wisconsin, some from southern Illinois, some from Missouri. It is a real representative body

of safety men, and we feel that with that body to work with we really have a great opportunity.

We recognize that we are likely to make mistakes. It is only human for us to do that; but we feel that this organization ought to make a success of its endeavors. If it does not, we are not prepared to say just where the fault will be.

I may say that if at any time when I am speaking any one of you desires to interrupt me with a question, I shall be glad to have you do so.

Commissioner LENNON. I was going to ask you this question: In all of your talk I have not heard a word regarding educational work that has been done by organized labor in connection with this, and they have been at it at least as long before you were born as you have lived in the world.

Mr. CAMPBELL. I am omitting that because I believe that to-day the real man to reach is the employer. I believe he is the man whom we have got to hammer at and make him appreciate the importance of it. I do not think we deprecate at all the activities of organized labor and all the work it has done in promoting proper and efficient legislation; but what we believe to be the problem before us is to get the employer before we get any satisfactory results.

Commissioner LENNON. I agree with you on that proposition.

Mr. CAMPBELL. Consequently we are trying to say what we believe to be the problem that confronts us to-day, and feeling that as strongly as I do, I have omitted to say anything of the kind suggested in your question.

Commissioner LENNON. I heard the predecessor of Mr. Garretson make an argument before a committee of Congress a good many years ago on this question, and Mr. Clark covered not only the railroad phases of it but the historical phases of it, as it applied to other industries. I do not know how long ago that was. It is so long ago that I have forgotten just exactly what year it was.

Commissioner GARRETSON. That was in 1898.

Commissioner O'CONNELL. Some years ago I was myself connected with that commission in the State of Pennsylvania.

Mr. CAMPBELL. I do not mean that the problem is a new one, but there has been new activity and a new impetus has been given to it to-day, and I am simply trying to say to you what I believe to be the present situation and where we really have to start to meet that situation.

Commissioner O'CONNELL. Tell us what you want this commission to do. We are all in sympathy with the proposition. Now, what would you have this commission do, and how would you have us do it?

Mr. CAMPBELL. I think the commission should do practically just what the act asks it to do. I believe that a complete investigation of the different phases of the work should be made under the direction of this commission. It may be that there is this remedy or that remedy or the other remedy for existing conditions. I do not think any of us is prepared to say just to-day how the thing ought really to be handled.

Commissioner O'CONNELL. This is a conciliation committee.

Mr. CAMPBELL. The thing that seems to me to be essential is that we really get down, as Mr. Price has said, to hammer and tacks and try to analyze absolutely and thoroughly just what ought to be done. I am not prepared to say just exactly how the thing ought to be worked out. It is a time, as you intimate, when I think we ought not stop to criticise or find fault. As has been aptly said by some one, in the language of the street, "It is time to sell your hammer and buy a horn." It is a time for constructive work to be done, and I believe this commission really has an opportunity to promote some. I believe it would be unfair for any of us to try to say to you to-day just what you ought to do. It is something that we can not sit down at this table and state in half an hour's time just simply by thinking about the problem off hand. It is something that ought to have thorough consideration, after looking over the whole field.

Commissioner LENNON. Is your organization ready and willing to cooperate with this commission to any extent that may be possible and feasible?

Mr. CAMPBELL. I was coming to that.

Commissioner LENNON. I beg your pardon.

Mr. CAMPBELL. I am authorized to say to you that our organization is ready and willing to cooperate with you to the fullest extent possible, in any way that you may require of us. Our executive committee and our facilities are at your disposal in any way you may see fit to make use of them. We would be very glad indeed to cooperate to the fullest measure.

Commissioner GARRETSON. Mr. Campbell, would it not put the matter in a practical shape for the use of the commission or for their investigation, for an association like your own, for instance, representing the interests that you do, to draw into concrete form an act which meets with the views that you have expressed, and present it to this commission for their consideration? They can thereafter make such investigations as may seem to them to be desirable and may make such modifications as appear likely to produce the desired results. Bear in mind that I am making this suggestion from the standpoint of a man who is absolutely in sympathy with the object to be attained.

Mr. CAMPBELL. I understand.

Commissioner GARRETSON. Because—let me draw your attention to one thing. If you have followed the history of safety enactments on this continent, all safety enactments have started right at the point to which you referred a little while ago. You desired to make it appear that it should come from the bottom up. All the safety appliance laws that there are in existence have originated from one of two sources—either laboring men or academic groups.

Mr. CAMPBELL. Yes.

Commissioner GARRETSON. But, as a rule, it is the academic group which has come to the aid of the laboring man, and most of the safety legislation in existence has been secured against the strong opposition of the very elements that now see the desirability of safety legislation. It seems to me that would be the quickest way to get into practicable working shape the very thing you are recommending.

Mr. CAMPBELL. That would be admitting that you could do the whole thing by legislation.

Commissioner GARRETSON. Has this commission any powers whatever except to make recommendations presumably for legislation?

Mr. CAMPBELL. That would be one of its functions; but I can see a broader function that this commission could well perform. After a complete investigation that the commission might make in such a way as it should determine to find out where the trouble is the difficulty will be about the ways of meeting that trouble, as I take it. One will be possibly by legislation. The other will be by the promulgation or the promotion rather of an educational campaign. Now, if your commission would put the stamp of its approval, for instance, upon the movement, and would point out the necessities of the movement, or make some such report as would bring the information to the knowledge of every manufacturer and every employer, that a commission of the character of this one has found that such and such conditions exist, and that such and such conditions ought not to exist, and that something ought to be done, and that every manufacturer ought to get into the game, why, if you did nothing else, your report made in that form would be of inestimable value in the whole campaign.

Commissioner GARRETSON. Can this commission put the seal of its approval in any other form so strongly as to recommend a specific act for legislative enactment?

Mr. CAMPBELL. That, if it was worked out, would be of very great value.

Commissioner GARRETSON. Therefore, what I have suggested would be the preliminary step and a skeleton upon which to hang that.

Mr. CAMPBELL. That would have to be very carefully thought out; and I am still of the opinion that, legislate as much as we will, get as much legislation on the books as we will, we still have not solved all of the problems.

Commissioner GARRETSON. My idea is to make you do a part of the thinking.

Mr. CAMPBELL. On behalf of my organization I will say that we will do anything you want us to do. We would feel in this way, however, that if we were going to undertake anything you asked us to undertake we would be at liberty to give it our thought, and we would want to be untrammelled. The day of partisanship in this sort of thing is no longer here, and it would have to be absolutely impartial, unbiased, and without strings of any kind. That is the sort of proposition that we would want to undertake.

The CHAIRMAN. What would be your suggestion? Would you suggest that we make a complete investigation—

Mr. CAMPBELL. I am not absolutely certain that I have given the matter sufficient thought to make any valuable suggestion. I will, however, give you the thought that is in my mind. My experience with such few of the committees and organizations that I have had to do with has shown me that the greater value and best results can be obtained first by the appointment of subcommit-

tees within the organization. I do not know what your form is here. My first suggestion would be that a subcommittee to have direct charge of this phase of your activity be appointed, which committee could take up and work out the different phases of the problem. I should say that that committee ought to get the best advice, the best counsel that it could. It is possible that we could do this; that we could let our organization be an advisory body to your subcommittee and advise that committee as to what testimony it ought to take, if any testimony should be necessary, or what other endeavor or effort might be made to get such data together as would enable the committee to consider the problem properly and possibly offer suggestions for the form of their report or recommendations to be made. I assume that that could be done, could it not, Mr. Price and Mr. Cameron?

Mr. PRICE. Yes.

Mr. CAMPBELL. If it should meet with the pleasure of the commission to adopt some such suggestion, I am very well satisfied that the National Council of Industrial Safety will be pleased to form itself into an advisory board for your subcommittee.

Mr. PRICE. We will do the hard work for your subcommittee.

The CHAIRMAN. Would you be willing to draw up in writing the outline of an investigation and submit it to our expert, Mr. Lauck?

Mr. CAMPBELL. I think that ought to be the result of a conference. If you should appoint a subcommittee, it seems to me that your committee knows in a way what you are aiming at, and we in a way know what the broad problem is, and it would be far better if we would simply say that we will appoint a committee to act with your subcommittee, and with such experts as your committee has here, the two committees to get together and thrash out a line of attack on the problem. That would be the very first thing in the way of a suggestion that you adopt that course.

Commissioner GARRETSON. I want to draw your attention to this from the standpoint of one member of the commission. You used the phrase a moment ago that the commission knew what it wanted to do. I differ with you absolutely on that. The commission do not know what they want to do in any direction.

Mr. CAMPBELL. I see.

Commissioner GARRETSON. And the commission wants the intelligent, honest suggestions of those interested in the subjects on which this commission is expected to arrive at a conclusion.

As to the advisory board, I would be absolutely at variance with that idea, for this reason: On this safety problem there are probably 20 different interests, each of whom would desire to be heard, and each would want to be a portion of that advisory board if there was one formed. I think you will recognize that without a doubt, and the consequence would be that for one interest to attempt to resolve itself into an advisory board would be an untenable position. But what I would suggest would be this: That, as proposed by the chairman, you draw an outline of what you believe to be the true course of action. Possibly, a dozen other parties interested in the subject would do likewise. Then it will become the mission of the commission to reconcile the various things that appear in these presentations and work out a plan of procedure from the whole that they will be ready to recommend. I do not know whether my associates on the commission would agree with that viewpoint or not, but it is the viewpoint of one man. As far as any suggestion of partisanship is concerned, unless the members of this commission are citizens first and partisans afterwards they might as well stop drawing their pay.

Mr. CAMPBELL. I do not think that question has arisen anywhere.

Commissioner GARRETSON. I do not think it has.

Mr. CAMPBELL. We are way beyond that.

Commissioner GARRETSON. I think if a commission constituted like this could not rise above its partisanship on general questions—

Mr. CAMPBELL. I had no reference to this commission.

Commissioner GARRETSON. I am aware of that.

Mr. CAMPBELL. We would want to be perfectly free to make suggestions of what we thought was right, irrespective of whether it was going to be detrimental to one or another.

Commissioner GARRETSON. My idea was that the commission would sit above the various plans suggested. This is only one of many questions that will be presented. To the men now before us who are interested in this matter it is naturally the largest question.

Mr. CAMPBELL. I have reference only to one phase of your work—the safety and sanitation phase of it.

Commissioner GARRETSON. I believe it is within the province of the men who are interested in that question to draw at least a fair presentation of what they believe would produce desirable results.

Mr. CAMPBELL. I have had no idea of suggesting anything for our organization to touch other than the mere question of safety.

Commissioner GARRETSON. I so interpreted your statement.

The CHAIRMAN. May I be permitted to make a suggestion? We have already adopted a sort of tentative plan of operation which includes the appointment of a managing expert. There are naturally people drawn from many walks of life, some with much knowledge, some with little, some with none.

Commissioner BALLARD. Speak for yourself [laughter].

The CHAIRMAN. Mr. Ballard is one who knows a great deal upon all subjects. I was going to say that we are going to try to work out these things tentatively at least through our managing expert. So the question now is, could you cooperate with us along that line, and will you be willing to make for us an outline of an investigation and submit it to our managing expert in writing? Hereafter, later on, we are going to take up the question as to just how we are going to operate, and there is no use trying to figure that out in advance until we hear what all the members of the commission think about it.

Mr. CAMPBELL. Mr. Chairman, we will be very glad to do anything we can.

Mr. PRICE. May I ask if that outline which you have in mind would be a preliminary outline? Then let us suppose that you decided that our body was the proper body to make the main investigation and their report leading to suggestions for legislation, etc., that would follow, or that you should decide on some other organization that had presented an outline.

The CHAIRMAN. I do not know what the rest of the commission think about it, but we are seeking the cooperation of every one who has any information or who has a plan to do anything. We are not bound to follow any of them, as I understand, but to take what the commission thinks is of significance and the vital points on the subject. Now we want to know whether you will draw up an outline. Suppose you were going to do this yourself. Suppose you were empowered to do what we are empowered to do, and you were going to make this investigation, how would you do it? We may follow your entire plan, or a part of it, or confer with you and adopt none of it. It will depend on its merits.

Mr. CAMPBELL. I want to say that we will do anything you want us to do. We believe there is so much possibility in what you may do here that it will be of such great value to the Nation at large that we want to help you in any way that we possibly can.

There was one thing, if I might be permitted to suggest, if your commission would bear with us, we would like to have one other phase of our work laid before you, so you may know what our organization is, and its secretary, Mr. Cameron, had planned to tell you a little bit of the activities that we are engaged in and just how our organization is doing its work, and I believe, if I may be permitted to say so, it might be better for you to get the full view of the organization before you give further consideration to the other matters or to this matter. I will say, if you desire us to act one way or another, in whatever way we can aid you, we stand ready to do so.

The CHAIRMAN. Mr. Cameron, the secretary of the National Council of Safety.

STATEMENT OF MR. W. H. CAMERON.

Mr. CAMERON. Mr. Chairman and members of the commission, I will just take one minute of your time. There is just one thought I want to leave with you, and that is that it is the entire aim of the national council to make its work as practical as possible. One of the principal things in this work is the organization of a central information bureau. As Mr. Campbell has said, there has been a good deal of work done in the different parts of the country by different people, but there has been no agency which would coordinate the information which has been published on the subject of safety. Now, the information bureau of the national council hopes to get together all the blue prints and photographs and models and printed literature on the subject of safety. I learned very soon after starting our work that organizations like ours are in the habit of putting information they receive into filing cases and

vaults, and not letting anybody see it. The members of the organizations of this kind are liable to pay their dues and not ask for anything. We determined from the beginning that the members were going to get the information. I started five weeks ago to send out a weekly letter to every member of the organization, and send out from three to five pieces of safety information. We have one out which is an authoritative standard book on elevators; a book on standards for safety on scaffolds. I have sent out a bulletin like that [indicating] on the subject of eyes, for instance, telling three or four stories of how accidents happened to eyes. Here is a bulletin which went out with one letter showing how this man's hand was cut off and the conditions under which the accident took place, making recommendations to avoid accidents of that kind. We have sent out a book of this kind on the standards of elevators and how to reduce accidents—boiled down information how to get at the subject.

Here is another book—an investigation on the subject of tuberculosis. Here is a book on the subject of examination of employees. There is not a piece of information in this country that is as original as this. It is a compilation of addresses made in Chicago under the auspices of the Illinois Manufacturers' Association, and has been distributed broadcast by our association.

Here is a pamphlet reproducing four pictures representing standard guards. Here is the picture of a man who lost an eye, who ought to have worn safety spectacles. When I was with the American Steel Foundries, we started, I think, the principal work on the protection of the eye. That company was losing from 12 to 15 eyes per year, and we absolutely cut the accidents to eyes out of our work. This was a man who refused to wear spectacles, and at the end of two years he lost this eye.

You can see this is very valuable. They have not, perhaps, the time or money and experience to spend on pictures of that kind, and we will furnish any number of those to our members. Here are three little pamphlets, two of them addressed to workmen, pointing out the advantage of wearing spectacles, and one to foremen—

The CHAIRMAN. Excuse me, Mr. Cameron, but if you have a copy of one of those to submit as exhibits, following what has been said, you might leave it with us.

Mr. CAMERON. I will be very glad to send one to each member of the commission.

The CHAIRMAN. If you will send it to Mr. W. J. Lauck, the managing expert, we would be obliged. Just send a copy of each one to him.

Mr. CAMERON. I will be glad to do it. Mr. Price has also spoken of them. We are also doing this from a national standpoint. There is a hunger everywhere for tangible information. People do not know what to do, and they want information as to how to do it, and they want to educate their men and want bulletins and blue prints and cartoons. We have some cartoons on the subject. Then we have lists on our files of expert safety engineers and lecturers and moving pictures. We have already been in conference with the State commissions in two of the largest States, assisting in the selection of safety experts, and we hope to be the headquarters along that line.

Then, I think perhaps the most important work that the council will do and is doing is the organization of local councils in the various industrial centers for the purpose of getting together the people that are interested in these various communities in the subject of safety. There never has been up to this time, particularly in the smaller cities, any agency that could bring together the safety engineers and experts and others to discuss safety questions. Our form of local councils is very much like the central safety committee that has been described by Mr. Price and Mr. Campbell. These men from various places get together around a table and not only discuss the general questions of safety, but their own experiences. One man brings to this round table a particular accident which had been new to them, and they discuss it—

The CHAIRMAN. Mr. Cameron, I do not wish to interrupt you, but I am going to make this suggestion. The commission, of course, by law is required to look into this subject of safety and sanitation. Now, we are thoroughly allied to the idea that it is desirable to bring it up to the utmost limit, and I think we are also satisfied that cooperation is a splendid thing, and perhaps a vitally necessary thing. It is to my mind, of course. If you would address yourself to what you think we could do, to the short cuts to doing this within the scope of this law, and what we are expected to do, I am sure the commission would be obliged to you. That is, if you have a suggestion as to whether we shall confer with the States or devise laws for the States or adopt some national

policy or anything that you might suggest this commission could do to help it along, we would be pleased to have your suggestion. We are assuming that every organization such as yours is doing its work well, and that it is well enough worth while for us to consider your whole scheme, and cooperate with you if possible. But the question we would like you to address yourself to is what we can do under the scope of this law.

Mr. CAMERON. There has been so much practical work done and so much criticism—

The CHAIRMAN. You get the point. The details of how you secure cooperation and how you project yourselves into the communities, of course, that does not affect us. The only way we could project it is by having public hearings and advising Congress as to laws. We assume, and I think the commission is thoroughly alive to the fact, that it is desirable to have laws. What shall we do as a national commission under the scope of this law to determine the conditions and sanitation and safety of employees and the provisions for protecting the life, limb, and health of the employees.

Mr. CAMERON. It seems to me the President has answered that question, and I am in entire sympathy with what he has had to say. Probably, as you suggest, the best way to handle the subject is to make some sort of a report to your subcommittee as to what we could do for you. I think I can stop right here. There is a lot more to say about our practical work, but—

The CHAIRMAN. It is not that I want to interrupt any single person here, because the information has been very illuminating, indeed.

Mr. CAMERON. I would be very glad to answer any questions.

The CHAIRMAN. There is just one question which you can answer, and briefly it is this, Has your organization made any detailed study of the question of sanitation?

Mr. CAMERON. No; it has not yet, but that is one of the subjects we hope to take up. We have a sectional idea which I did not touch upon, in which we hope to get together the different groups of people—

The CHAIRMAN. But you have not done anything on it as yet?

Mr. CAMERON. No.

Mr. CAMPBELL. There has been a great deal of work done, and that is available in our service, Mr. Chairman.

The CHAIRMAN. Now, I believe that it was suggested that the next person we would like to hear from would be Mrs. Robins, if she is ready now.

Mrs. ROBINS. I am.

STATEMENT OF MRS. RAYMOND ROBINS.

Mrs. ROBINS. Mr. Chairman, Mrs. Harriman, and gentlemen of the commission, as far as I can judge, to go back a while, this commission was created to find out the underlying causes for the present dissatisfaction. That is, to find out what was in the minds of a great number of people who are immensely interested, to see if we can come to some understanding of what is happening in our great American land and yet do what we can to bring about improved conditions. "That the commission shall seek to discover the underlying causes of dissatisfaction in the industrial situation and report its conclusions thereon," in my judgment, therefore, is the work of the commission, but what I want to bring to your attention this afternoon would divide itself into two thoughts, some of the fundamental causes and then some of the contributory causes. Representing as I do a woman's organization, the women's trade unions of the country who have affiliated themselves with the National Women's Trades Union League, I am certain that we feel that we are somewhat a contributory cause; that is, the conditions which make for women's work are somewhat of a contributory cause to the dissatisfaction. But if I might for the moment speak of what seems to me some of the underlying causes which make for this dissatisfaction, I feel, to put it very briefly, that simply means the denial of rights, the denial of justice, if you will, or rights of the working men and women of our country. If that cause is an element which acts continuously, not just here and there, but every single day, for 10 or 14 hours of work, then I think we perhaps should find out if there is any truth in the statement or the thought that it is the denial of right which is causing these tremendous upheavals in America to-day. I think if we could find out what some of these causes are, we might be able to get nearer a solution.

For instance, I am very deeply interested in this matter of sanitation and safety. I think in this matter of sanitation and safety we ought not only to

see that safety measures are introduced for machinery but that we ought also to see that the machinery at which girls, at any rate, are made to work should be so adjusted to the make-up of women that we do not at the very start put the young womanhood and the possibility of motherhood in jeopardy. For instance, by way of illustration, we might find out why it is considered necessary to have the tread in many of our laundry machines or binding machines 7 or 8 inches from the floor, so that when the girl has to put the whole weight of her body on it, say, 32,000 times a day, she has to lift her foot 7 or 8 inches from the floor. That is one of the smaller matters that might be looked into in connection with this question. But granted that we have the laws, I for one would find it quite impossible to leave the enforcement of that law to any employer's willingness to have that law enforced. I would be against it, because when it depends upon one man's willingness whether it is or is not to be enforced, it is not likely to be done, and because one of the big things we ought to do is to get the definite recognized cooperation of the working men and women if the laws which are enacted for their benefit are to be enforced.

Now, my point is this: We have, for instance, laws not only for safety and sanitation but we have laws limiting the hours of work. In Chicago—and Chicago is just one city, and it is happening all over—our young women in the department stores and in the factories and workshops, when they call the attention of their foremen or their employers to the violation of the hours of work, are dismissed. They are simply told to look elsewhere for a job. Just a few days ago we received a letter from a young girl who called our attention to the fact that there was a violation of the 10-hour law in the factory where she was working. She refused to sign the letter, as all of them do, stating she knew she would lose her job if it were known who she was. We reported to the factory department and the factory was found guilty of violation of the law and the employer was fined, and there was a great deal of inquiry made as to who had given the information; and this particular girl was summoned to the employer's office and she admitted that she had written the letter of information and she was summarily dismissed. If that happens only once or twice, well and good; but if it happens all the time and forever and a day, then that situation means a denial of the right of the girl to her rights of citizenship, and also of her rights to stand with her fellow workers.

By way of illustration, I feel that if we could at once adjourn to Calumet, Mich., and find out what is the reason for that situation to-day, one of the big things would be begun before this commission. I do not know whether you are in a position to do that or not, or whether you have decided to take any action in any of those matters which are occurring at the present moment. But by way of giving you a sense of the reaction that is going on there at the present moment, when that Christmas tragedy occurred—and the women in Chicago had sent a great many of the things which were on that tree when that terrible Christmas tragedy took place—the reaction of the women and men in the labor world was just this: If that Christmas festival had been a festival of the rich people's children, of the mine owners', and not of the mine workers', everybody who could possibly be accused of having caused that tragedy would have been arrested, but because they are children of mine workers no such attempt is made. I am not saying that that is a fair conclusion to reach, but that is the reaction in the people's minds.

It is also true, I think, that we really ought to understand how impossible it is for us to tolerate industrial conditions which make it impossible for the women to feel that they have the right to organize. If the right to organize is not recognized as a right in America, it ought to be plainly stated, and we will know where we are. But if it is recognized, then the courts ought not to be used to enjoin us from organization, and woman ought not to be deprived of her right because she wants to join an organization. In the capacity of the working women and the strength they have within the four walls of the factory or the department store lies the only chance to have any law enforced throughout the land. I am not speaking of exceptions. One of the most vivid illustrations is the terrible Triangle shirt waist fire that occurred, as you will remember, after the great shirt-waist strike in New York. I believe when that strike was settled something like 90 factories signed up, recognizing the union. The Triangle factory was one of the factories that refused to sign up. Three months later they had dismissed every one of the girls who participated in the strike, with the exception of two of the newly arrived immigrant girls who were working there. Escape was made practically impossible

because of the locking of the doors. One hundred and forty seven girls lost their lives, as we know. We also know about the great mass meeting in Carnegie Hall and the tremendous demonstration in New York. A few months ago that same factory was examined before one of the municipal courts in New York City, and it was again found that it had violated the fire ordinance of New York City and had again locked its doors on 150 girls. The fine of the judge was \$20. It is that sort of a sense of never being able to get back at a wrong that has been done them that is making for this tremendous upheaval in American industrial life to-day. And it is especially necessary that we stand for the right of organization and make it clear that it is a right to be guarded, as one of the liberties to be guarded by the courts and not fought by the courts step by step, hour after hour, and day after day, as is being done at the present time in our industrial world.

After that Triangle factory fire the trade-union girls of Chicago got together and formed themselves into a Committee of the Women's Trade League of Chicago, and formed a fire-protective committee, and called upon the mayor and the city council and demanded the enactment of a fire-prevention bureau, and that was done. We wanted very much to get information from the working girls and we had 125,000 leaflets printed in five different languages and we asked for information as to the fire protection which they might enjoy, and out of those 125,000 leaflets distributed we have received something like 25,000 answers which, I think, every one will agree is a pretty big proportion. Of those 25,000 answers which were sent in barely 1,000 had the names of any of the senders signed to them for the simple reason that every girl knew that if she gave her name and if by any chance her name was known to her employer, she would lose her job. If that is the concensus of opinion of the women in the second greatest industrial city in the world, we are not dealing with what is just happening here and there, but with a very great and important fact, which will do something to eliminate the condition.

I feel if it were possible for this committee to look into the question of the right of organization and into the question of the courts as they play their part, making it impossible for the people to exercise their rights, we would come to one of the underlying causes that makes for the dissatisfaction in American life to-day. And I think also that whereas surely it is very fine to be able to work with one or two hands, with every finger protected, and not have to work as a cripple, minus a hand or a leg or a scalp—because in some of our printing establishments at Chicago some of our girls have been scalped because the machines were put so close together that the hair caught in the machine back of the girl—nevertheless, it is not that sort of thing that is going to eliminate the difficulty. We are pushing further away from the root of the matter, unless we can, by getting at the root of the matter, see what are some of the contributory causes.

Among some of the other contributory causes I would like to speak of the women's work. There are certain things that have made it very difficult for women to be anything but the underbidders in the labor market. They have come into the labor world very unexpectedly, and I say that, even though it is nearly 100 years since they have been in factory life in America. They were untrained to team work, which meant they were untrained to organization. They were only beginning to find their way when we had this great and mighty Civil War in our midst, which created a hiatus in our industrial development and industrial life, and they only slowly came to the recognition that they had to translate their laboring power into cash value. They also represent, Mr. Chairman, a disenfranchised group. Every disenfranchised group in every country in the world is the more easily exploited. You only have to compare the exploitation of our women with the newly landed immigrant men and women to realize what is denied to the women of our country in most of our cities to-day. And being disenfranchised we stand as the more readily exploited group of labor. There is a great attempt very wisely being made to introduce with safety appliances industrial training into our public schools. Because of the fact that we stand disenfranchised in the communities that trade training is being given to boys over and above girls time and again, and the general thought is that the girl is only a potential wife and mother. She is a potential wife and mother, but she is also a bread winner, and I think it is exploded as a theory that she is only in the industrial world for seven years or so. We are in it, most of us, for keeps. At any rate, the last investigation made by the legislature showed that women stayed 10 or 15 years, if not longer, and that the great percentage of them do that.

I feel that it would be well, if it is possible—I do not know that it is or whether it comes under the jurisdiction of the commission, but simply as one of the contributory causes, and I do want to make it clear that I recognize it is not an underlying cause, that equal opportunity for training is given to the girls and boys, and that the girl therefore enters the trade through the open door and not as an underbidder through the back door. Of over 300 occupations and trades listed in the United States Government reports, women are to be found in nearly 300, and therefore to try to train women in 300 trades simply by teaching them sewing and bookkeeping is making them more difficult. We also know in our various city halls that whatever stenographic positions are to be won, even through civil service, the women may stand first on the list, but they are displaced by the men simply because the men represent the enfranchised group.

Commissioner LENNON. Then how about the wages of the women that they are demanding?

Mrs. ROBINS. Thank you, Mr. Lennon, I am very glad you mentioned that. When women are taken, the reason they have been taken in such large measure is because they were taken as cheapening labor, and the struggle between the women and men in the labor movement has been very tragic because of that fact, that the men have recognized her coming into the labor world as an untrained group, utterly unknowing the conditions under which they are asked to work and underbidding continuously. And yet we are beginning to make the women understand that if they underbid themselves they are their worst competitor, because somehow or other she may marry that man and be asked to live on the wage she has cut down. So one of the things we have to do is to realize we have got to—I think I may say this—our women, I think, must stand more than the men as the group in the sweated industries. Now, we have to see that that sweated industry in which we find ourselves is absolutely abolished.

Of course, the abolition of home work, I suppose, is to be enacted nationally, or at least through every State, as far as we can make the people understand it. But this question of wage we feel can perhaps be thought out wisely by a creation of minimum-wage boards for women and for minors, not by the establishment of a flat rate (I am now speaking for the delegates of the National Women's Trades Union League), but by helping to establish minimum wage boards for every industry, and to get the collective thoughts of the men and women in the industry, the workers to select their representatives, the men of the firms to select, if they will, their own representatives, and let the public thrash out the difficulties and come to an understanding that the minimum wage can be established. It has been established in other countries and even in our country. It does not necessarily mean the breaking up of industries. We found in the Massachusetts investigation that in the candy industry there was a difference of 56 per cent in the wages paid for the same work in the same city with the same transportation facilities and all other industrial facilities which went to make up that particular manufacture. And the competition that the employer who wishes to be square with his girls has to meet when he meets an employer paying less than \$5 a week in the same industry is some of the unfair competition we believe the minimum wage board will eliminate altogether.

Commissioner WEINSTOCK. From your knowledge and experience how far do you think the fixing of a minimum wage by the State would tend to make that minimum a maximum?

Mrs. ROBINS. It is because of the fear of making the minimum a maximum wage that we do not wish a flat rate introduced. I have been speaking of Chicago because I am more familiar with conditions there than I am with conditions anywhere else. We would like a minimum for the box-making industry, but we would like to have it established in this way: We would like to have the workers meet with the manufacturers and thrash out the minimum wage. Then we would feel that that minimum wage could not be permanently established for all times. It must be a fluctuating minimum, and later on there ought to be the right to have another meeting at the request either of the workers or their employers for the establishment of another wage.

Commissioner WEINSTOCK. But ultimately it would mean that the wage would be fixed by the power and authority of the State?

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. Now, having been fixed by the power and authority of the State, how much danger is there of the minimum becoming the maximum?

Mrs. ROBINS. None at all, if the workers are franchised and if there is the power to recall the minimum-wage board.

There are many other things that I could go on and speak to you about.

Commissioner O'CONNELL. On this question of safety, in addition to the question of safety of life and limb, do you think there should also be attention paid to the physical safety and welfare of the employees?

Mrs. ROBINS. Surely.

Commissioner O'CONNELL. And that safety organizations, in addition to seeing that safety appliances are installed, should take into consideration the correcting of machines so as to preserve the health of the workers?

Mrs. ROBINS. Surely; and also I would look upon the shorter workday as one of the most important things connected with safety and sanitation. It is quite idle talk about safety and sanitation unless we have the eight-hour day, because we all know what results from fatigue caused by working excessive hours.

Commissioner WEINSTOCK. You remarked a little while ago that one of the underlying difficulties is the fact that women, especially, are not given opportunities to organize?

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. How would you remedy that? Of course you stand for unionism, for collective bargaining?

Mrs. ROBINS. Surely.

Commissioner WEINSTOCK. Would you have the State establish a preference for union workers, as it does in New Zealand, for example?

Mrs. ROBINS. I think I would leave it to the individual worker. Unless we study the industrial situation very intimately I do not think we can understand how continuously the powers that be are used to make union organization impossible. We girls in Chicago had a meeting at which Mrs. Joseph T. Bowen spoke, and the purpose of that meeting was to form a union for the bettering of conditions in department stores.

Commissioner O'CONNELL. Why not have the State say that it is not unlawful to organize?

Commissioner WEINSTOCK. Is there any State to-day that says it is unlawful to organize?

Mrs. ROBINS. Thousands of employers make their own laws to-day, and make it unlawful for the girls to organize by discharging them for organizing.

Commissioner WEINSTOCK. They do not make it unlawful to organize.

Commissioner O'CONNELL. The employer creates the law, makes a law unto himself.

Commissioner WEINSTOCK. He exercises his individual rights.

Mrs. ROBINS. Yes; and they are supported by the courts.

Commissioner BALLARD. I think Mrs. Robins has the floor. If we get into an argument here, we will never get out of it.

The CHAIRMAN. Yes; Mrs. Robins has the floor.

Mrs. ROBINS. What I was trying to say was that if we had a State law standing for the right to organize, then we ought to see to it that the courts guaranteed that right, so that we should not talk up in the air. We, as American people, are standing for self-government and all that. We know that we do not always live up to it, but still it stands as one of the fundamental principles of our American lives and thought. If we could make self-government one of the fundamental principles of industrial life, and if we could prevent the courts from usurping the power to deny the rights of the workers, I think we would get at one of the underlying causes of the existing conditions of unrest.

Commissioner WEINSTOCK. Speaking for myself, what you say is a revelation to me. I thought I was reasonably familiar with the labor laws of the country, at least as familiar as the average man, but this is the first time I have heard that it is made unlawful—unless I misunderstood you—that any State law says it is unlawful for men to organize or for women to organize.

Mrs. ROBINS. The whole power of the machinery of the courts and the police power of the State are used to make it impossible for the people to organize. The right is simply a paper right and has no vitality, and so it is worthless. By way of illustration, about 400 young women came to this department store meeting. They came from the department stores on State Street in Chicago, and among them was a young woman who had been working for 15 years. We did not form an organization that night. Mrs. Joseph T. Bowen, of Chicago, spoke. This particular young woman and many another were at once

dismissed. This particular young woman who had worked for 15 years was dismissed, and was blacklisted in every State Street store. What I mean is that if she could get her rights, if she had any chance of getting her rights, it would be so that that particular employer would be told that he was not within his own rights in doing those things, and then we would not have the continuous power of the employer used, by his refusing to employ people who join organizations, and we would not have the employers supported by the police powers and the courts.

Commissioner WEINSTOCK. Do you think the State could go as far as that? Do you think this board could recommend anything of that sort that would not be one-sided? For example, the worker under the law reserves to himself the right to leave the service of his employer for any reason or for no reason.

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. Now, should not the employer then have the right to retire any of his people for any reason or for no reason?

Mrs. ROBINS. That is begging the question, isn't it, because if we do not make it possible for men and women to do that which they think is right and which the law of the State tells them is right, if they can not act upon that right, then the right is invalid.

Commissioner WEINSTOCK. If I can compel my employer to retain me, he ought to be able to compel me to remain in his service, and if he can not compel me to remain in his service I do not see how I can compel him to keep me when he does not want me.

Mrs. ROBINS. You would not think an employer was acting within his rights, even though he might be acting within his power, to dismiss an employee because he was a Roman Catholic or a Mohammedan?

Commissioner WEINSTOCK. He would have a perfect right to do it.

Mrs. ROBINS. But you would not feel that he was living within his rights to dismiss people because they were members of a particular church? You would say there was something wrong in his doing that?

Commissioner WEINSTOCK. So long as the workers have the right to leave the service of an employer who is a Catholic, a Protestant, a Jew, or a Christian because he is one of those things the employer certainly has the right to dismiss an employee for the same reason, and I do not see how the law can compel him to do otherwise.

Commissioner BALLARD. If the employer does not care whether his employee is a Roman Catholic or an Episcopalian, a Methodist or a Baptist, why should the employer object to that girl becoming a member of a trade-union?

Mrs. ROBINS. Because the beginning is made for his having a self-governing group within his factory. This theory of industrial autocracy is still very much with us in our midst. Man after man will do everything under heaven for his workers except give them the right to decide certain questions for themselves. There is no getting away from that. All this so-called welfare work is but the expression of that. It says, "We will give you bread or we will give you roses, but we will give you nothing to say about it." We are going to have one tremendous volcanic eruption unless the workers are given that right, and that is one of the great underlying causes.

Commissioner BALLARD. Why do the employers refuse that?

Mrs. ROBINS. Some of them do it because they are living in the conditions of the past. I remember when I went in the box-making industry in New York City there was an employer who was employing no one except nonunion people, and he was employing not only nonunion people, but little girls, and he was asked to recognize the union. He said with a great deal of emphasis that neither his father nor his grandfather had recognized the union, and neither would he. I suggested that probably his son and his grandson would recognize the union, and why could he not be a leader in the family instead of a follower. I think there are a great many more who are living in the past.

It is not only in industry that men think they know better than other people. Our present political upheaval is due to the fact that certain men have thought it was their right to decide certain questions for others; and this democracy of industry is just a later development of political and religious democracy. We have got to have it.

Commissioner WEINSTOCK. Is it or is it not a fact that in certain States of the Union there is a law which makes it illegal to blacklist an employee?

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. That is, it does not make it illegal to dismiss an employee, but does make it illegal to blacklist him?

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. Is not that a protection to the worker?

Mrs. ROBINS. No; because if you do not have at your command the highest legal ability or great legal ability, you will be defeated in the courts?

Commissioner O'CONNELL. A case has never been sustained or proved.

Mrs. ROBINS. I think you are right about that. We had a case against the Illinois Manufacturers' Association, a case of the garment workers, and it was proved beyond a doubt that they were blacklisting their workers, but that was the end of the story.

Commissioner WEINSTOCK. I gather from your statement that in your opinion the remedy for industrial unrest would be to penalize the employer for dismissing a worker who tried to organize?

Mrs. ROBINS. We do not even need to go that far, if you will deny to the employer the right to use the courts and the police power to work out his theory. By way of illustration, in a glove factory in Chicago—I am speaking of Chicago because I know that better than I do other places; I do not think Chicago could be worse than other cities, but I know more about it—last summer there was a very small fight of men and women, a very few hundred people in the factories of Chicago, for the sake of having some chance of recognition of the union; that is, having some way of seeing that the laws were enforced, that the fire ordinances were enforced, and that wages were up to the necessities of the workers, so that they not only got their money on a piece of paper, but that they got it. The police power of the city of Chicago was immediately put at the disposal of those employers, and they denied the right of the workers to meet in an open field, and the man who at the present time is chief of police of the city of Chicago, Mr. Gleason, was at that time captain of that division of the police, and he forbade the workers to meet there and discuss their grievances in that open field. It was in the summer time. They met and there was a scuffle, and people were arrested for disorderly conduct, and they had the whole power of the police and the judges and the courts against the workers.

Commissioner WEINSTOCK. The thing works both ways, because any number of employers in the city of San Francisco have charged that the courts and the police were utterly failing to protect their workers against strikers. There are grievances on both sides.

Mrs. ROBINS. It seems to me that the proof of the pudding is in the eating. The condition of the employers and the condition of the workers is the best proof of where the power lies to-day.

Commissioner WEINSTOCK. I think this commission would appreciate it very much if you could accurately point out how far you would have the law go, and how far you would have this commission go in recommending legislation along the lines indicated.

Mrs. ROBINS. I should be very glad to do that.

Commissioner WEINSTOCK. You may not be able to do it offhand.

Mrs. ROBINS. I will do it gladly.

Commissioner GARRETSON. Do not a number of States now make it an unlawful act for an employer to discharge an employee for joining the union?

Mrs. ROBINS. Certainly; and that is all we ask.

Commissioner GARRETSON. Has not the Congress of the United States itself passed at least one such act?

Commissioner WEINSTOCK. If that is the case then what—

Commissioner GARRETSON. You might ask what was the fate of that act, what the lower court did to it.

The CHAIRMAN. Mrs. Robins, have you any thought at the present time, or would you be willing to think out some plans by which you could submit to us what you believe to be an idea that will bring some constructive work out of this thing?

Mrs. ROBINS. Very gladly.

The CHAIRMAN. You have thought it all over, and have knowledge of the laws already in existence. What would you say this commission could do now as a body to remedy the conditions which you say exist?

Mrs. ROBINS. Of course one of the reasons for the difficulties with some of our laws that are on the statute books is that public opinion, as expressed by the powers that be, is not backing them up at all. I should think one of the most important functions of this commission would be to express themselves distinctly on these vital questions, so that they would give force to public opinion back of these matters. If it could be generally admitted as a law in

every State that no employer has the right to dismiss any man or woman for joining a union, and not only have that law on paper, but see that it means something of vital significance in the lives of the workers, I would think that would be a very important thing to do, and I should think it would be very important for this commission to find out how far-reaching is the action of the courts in all the time usurping power for harassing the workers.

The CHAIRMAN. Would you be willing to give us an outline of anything that suggests itself to you as fundamental and constructive in the way of laws, and also the most direct method of ascertaining the duties of the courts in administering the law in industrial disputes?

Mrs. ROBINS. Shall I give it in writing?

The CHAIRMAN. We would prefer that you would do it in writing, and address it to Mr. W. J. Lauck.

Commissioner O'CONNELL. Is it not the purpose of this commission to reach into the causes of the great industrial unrest, the causes of the great industrial disturbances—not some little evil, but the great things that have caused millions of people to suffer?

Mrs. ROBINS. I never can forget Westmoreland, and we have had it repeated in West Virginia, and now we are having it repeated in Michigan. It seems impossible, and we must not hesitate to try to find out where we are at, with these tremendous volcanic eruptions occurring on every side.

The CHAIRMAN. We will have the secretary write out the request that I made of you, so that you might have it.

Mrs. ROBINS. Yes.

Commissioner BALLARD. If a manufacturer's plant becomes organized and his employees join a trades-union and all of his employees are members of the American Federation of Labor, would you consider it fair on the part of his workmen or fair on the part of the American Federation of Labor, if they had a quarrel with some other concern, perhaps a hundred miles away or 10 miles away, and if this man's plant should be closed, simply in order to hurt the other people?

Mrs. ROBINS. You mean the sympathetic strike?

Commissioner BALLARD. Yes.

Mrs. ROBINS. I think the sympathetic strike is one of the greatest weapons in the hands of the laboring people.

Commissioner BALLARD. Of course it is, but is it right?

Commissioner WEINSTOCK. Would you think it morally right for a union to go on a sympathetic strike when it was working under a contract with an employer? In other words, would you think it morally right for the union to violate its contract in order to go out on a sympathetic strike?

Mrs. ROBINS. I do not like breaking contracts, but sometimes you have got to break them.

Commissioner WEINSTOCK. You justify the breaking of contracts, do you?

Mrs. ROBINS. That depends upon conditions.

Commissioner O'CONNELL. That is not justified by organized labor.

Mrs. ROBINS. No. Organized labor does not justify sympathetic strikes, but I was speaking from my own individual idea. We do know that the business of our lawyers is the breaking of contracts, because conditions have changed and because of the necessity to break contracts between people.

Commissioner BALLARD. Do you not think that the Chicago department stores were afraid to have unions organized among their employees, not because of objections to the unions but because they feared that they might find themselves closed up with a sympathetic strike in their busy season?

Mrs. ROBINS. No; I do not think it was the fear of a sympathetic strike. I think it was the fear of having some of the conditions in the department stores made public by people who could speak without losing their jobs.

Commissioner WEINSTOCK. May I ask, if it is permissible to ask, what branch of organized labor you are affiliated with, or what branch of organized labor you represent?

Mrs. ROBINS. I do not represent any particular branch. I have the honor of being the president of the National Women's Trade Union League.

Commissioner WEINSTOCK. Is that affiliated with the American Federation of Labor?

Mrs. ROBINS. No, sir; we can not be affiliated with the American Federation of Labor for this reason: We represent in our membership men and women who are unionists, men and women who believe in the principle of trades-unionism, and yet who are not trade workers. The constitution of the American Federa-

tion of Labor does not make it possible for us to be affiliated as an organization with the American Federation of Labor, but every one of the unions belonging to the National Women's Trade Union League is affiliated with the American Federation of Labor.

Commissioner WEINSTOCK. You are speaking for your association then?

Mrs. ROBINS. Yes, sir; for the National Women's Trade Union League.

Commissioner WEINSTOCK. Of course, we all know that organized labor is represented by three federations or three elements—the American Federation of Labor; the Socialists, pure and simple; and the I. W. W.

Commissioner LENNON. You do not mention Mr. Garretson's organization.

Mrs. ROBINS. You forget Mr. Garretson's organization.

Commissioner BALLARD. I suppose he thinks that Mr. Garretson can speak for himself.

Commissioner WEINSTOCK. I know that Mr. Garretson does not represent the I. W. W.

Mrs. ROBINS. Oh, no.

Commissioner WEINSTOCK. With which branch is your organization affiliated?

Mrs. ROBINS. Our constitution makes it imperative that we affiliate with only those unions that are affiliated with the American Federation of Labor, either directly or through the international union.

Commissioner GARRETSON. On this question of breaking contracts I want to ask you one question, and I want to preface that question with a certain statement—that in the 40 years of the existence of the organization of which I am a member it has never broken a contract. But what I want to ask is this: Is it not true that the court itself will cancel a contract or forbid the making of a contract that is against public policy?

Mrs. ROBINS. Yes.

Commissioner GARRETSON. And has not the court of conscience as much right as the court of law?

Mrs. ROBINS. I would like to have it definitely understood that I am not speaking for anybody but myself when I say that I for one believe there are times when the breaking of a contract is the lesser wrong, and I do think we ought to recognize that; but I would also like to say that at the present time all the unions with which I have had any dealings, even in any of the great fights, have stood for no breaking of contracts, nor has there been any such record in our history.

Commissioner O'CONNELL. In order to straighten out this idea of the sympathetic strike, if the women of one of the organizations affiliated with your organization were on a strike against a reduction of 25 cents a day in their wages, and they were making dresses, and that employer took those dresses over to Clark Street to be made in another factory by employees in that factory, would you consider it justifiable for them to refuse to work?

Mrs. ROBINS. Surely. Now, if there are no other questions—

Commissioner BALLARD. Suppose they have a strike on the Illinois Central Railway, and they refused to allow a man to ship freight over the L. & N., would that be a justifiable sympathetic strike?

Mrs. ROBINS. I will let the Brotherhood speak for itself.

Commissioner GARRETSON. If you will convince us that the L. & N. is getting the money, we will let it go; but the L. & N. can not haul and the Illinois Central get the money.

Commissioner BALLARD. That proposition is a technical point of railroad. Commissioner GARRETSON. It is not technical but financial.

Commissioner DELANO. Nobody ever heard of it until you suggested it.

Commissioner LENNON. If the Monon got it, it would be all right.

Mrs. ROBINS. We feel the need of organization very keenly, because we feel that charging individuals with a responsibility is the only way of obtaining our rights. If we have industrial conditions that simply demand that a girl be an attachment to a machine, that means the turning of that girl into a machine, and no civilization can possibly rest upon men and women who are machines instead of men and women. Now, we stand for self-government in our American population, and we ought to stand for self-government in the workshop, and we see the necessity for it upon every hand. This need for self-protection is a very imminent need of working women. It is not a matter of small concern, but it is a concern that touches us immensely and deeply. To show you how vitally it touches us, quite aside from protecting our work and our wages, and sanitary appliances and safety appliances, let me tell you this story. In Newark in one of the hat-trimming factories, where the labor was

unorganized, there was a young Polish girl who had not been in this country very long and she was insulted by one of the foremen. She resented the insult and the man said he would dismiss her. She was so startled and amazed at the idea that the right of dismissal was in the hands of the man who had insulted her womanhood that she sat down and wrote a letter to the employer, put on a special-delivery stamp, and mailed the letter. Of course we do not know positively that the letter reached her employer, but we do know that the girl was dismissed, that for two weeks she was looking for work, a stranger in a strange city, and by accident she was found by some of my sister's friends and given work. For the last two days she had been living on coffee and rolls. I think that was putting it up pretty stiff to a working woman or anybody else.

Now, in the same city, in an organized factory, there was also a foreman who insulted one of the girls, and that girl resented the insult. Again the foreman tried to dismiss her. She spoke in very broken English, but she pulled out of her pocket her union card and showed the words which say that you must show just cause for dismissal. She was wondering what she could do, when a young English American girl demanded an apology of the foreman, who refused to give it. She called a shop meeting of 250 young women working in that factory, and asked them what they would do. They had a contract, but they all voted then and there to go on a strike until that man had apologized. Now, you know what happened. That foreman and that superintendent were not running that factory, and when the employer heard that there was a strike, they had to tell him that there was a fight on in his factory; he came down from one of his other places of business and asked for an explanation. He sent for Miss Scott, and he asked her, "Will your young women come back if this man apologizes?" She said "Certainly." A few hours later the young girls were all back at work. Then this employer in the presence of these young women demanded an apology from this man. He gave it and then the employer turned to this foreman and said, "I stand for no such action toward any woman in my employ."

The whole point is just this, that this one girl was able to reach the owner of that factory through the regulated and established machinery of the workers' own organization, through their own selected representatives. This whole question is so vital that we can not very well discuss academic questions in regard to it.

Commissioner WEINSTOCK. May I invite your opinion upon one other question that touches upon this whole matter?

Mrs. ROBINS. Yes.

Commissioner WEINSTOCK. This, of course, will be purely an opinion on your part. Do you think that industrial conditions in this country would be helped if the Australasian system was followed of having practically closed shops but open unions? For instance, in Australasia the State deals with these problems and, as a rule, the judgment of the industrial court is that the employer shall give the preference to unionists, provided, however, that the union is an open union; that only a trifling fee shall be charged for admission; and that only a trifling weekly fee shall be paid into the union; and unless the union is prepared to remain an open union, as it were, then the unionist is not given the preference. Now, do you think that system would apply in this country?

Mrs. ROBINS. Yes; I think it would be a very great advantage. I am not specially or deeply concerned with giving the State anything more to say upon these matters than to make it possible for men and women to bring about their own united action. I, of course, would like to have it made illegal for any employer to dismiss a man or a woman because they belong to an organization, and I want to see that more than an illegality on a piece of paper. I want to see their rights protected.

Commissioner WEINSTOCK. Of course I do not know whether you are aware of it, but many employers in this country take the ground that unionism is unreasonable because it demands not only a closed shop, but a closed union as well.

Mrs. ROBINS. I do not believe in putting up barriers, and that is recognized as being just as wrong within the labor group as it would be within any other group.

Commissioner O'CONNELL. Ninety per cent do not do so.

Mrs. ROBINS. Yes; practically 90 per cent do not. I also know that when we tried to organize a group of workers in Chicago the girls hesitated for a long time, because they said if it was known that they were joining the union they

would lose their jobs; and finally one young Russian girl got up and said, "We have had our fathers and our mothers willing to die for their religion. I do not see but we might be willing to die for our rights"; and my thought is that unless we do something we can not possibly expect to stop these volcanic eruptions that are going on around us.

The CHAIRMAN. One word, Mr. Price. Has the Wisconsin commission attempted to establish any standards for the conduct of industrial plants that would conserve the health of the employees, as suggested by Mr. O'Connell here and by Mrs. Robins, as to how a machine should be operated, the length of time a machine should be operated continuously, etc.? Have they done anything of that kind?

Mr. PRICE. It has not, Mr. Chairman; but it lies within the power of the industrial commission, and we have now in mind, if it is not actually on foot, the investigation of just that condition; and it lies easily within the power of the commission to act upon the results of that investigation. We can not only do that, but we can go into the plant and work out the moral well-being of the employees, too.

The CHAIRMAN. Just one other point—

Commissioner O'CONNELL. It is just as serious to break down a man's health as to take off his hand or arm.

Mr. PRICE. We have not made ourselves clear. When we say safety and sanitation, we mean everything that concerns the welfare of the man—mental, moral, and physical.

The CHAIRMAN. Mr. O'Connell, is there any agency that has made any sort of definite study of that question, that you know of?

Commissioner O'CONNELL. Of the physical safety?

The CHAIRMAN. Yes.

Commissioner O'CONNELL. I do not know it.

Mr. CAMERON. The laundry workers have made some study of that.

The CHAIRMAN. But there has been no general work done along that line by any public or private agency? We are leaving out safety now and are getting down to suggestions, as, for instance, the instance of the girl who has to raise her foot too high to operate the machine or do it too long every day.

Mr. CAMERON. I think if you had Mr. Taylor before you, of the efficiency-management bureau, you might get some line on it, because he is working along that line.

Commissioner O'CONNELL. I do not think Mr. Taylor ever figured a moment about saving anybody's life. I think he has figured entirely on getting rid of life.

Mrs. ROBINS. The health committee of the Woman's League of Chicago has started in with the idea of helping girls after they are broken down, and they are now making a special investigation of the causes which make for the breaking down of girls in the binders' trade industry; so some of the women's leagues are doing that at the present time.

The CHAIRMAN. Mr. John B. Andrews, secretary of the American Association for Labor Legislation, is here, and as his association is about to meet I would like to call him now.

STATEMENT OF MR. JOHN B. ANDREWS.

Mr. ANDREWS. Mr. Chairman and members of the commission, I am not a safety expert, but I want to say that the organization which I represent takes a little different view perhaps of the problem that is before this commission than has been presented by the speakers this forenoon or by Mrs. Robins in her talk this afternoon. We approach the problem from the standpoint of legislation, and our statement on the very subject which has been discussed so much here to-day is to this effect, that the business of factory inspection, of the enforcement of the labor laws, instead of being based upon fear, force, or favor should become a cooperative educational effort on the part of the employer and employees and the experts provided by the State.

In 1909 our association issued a pamphlet which attempted to give to the people of this country an analysis of the machinery then existing for the enforcement of labor laws. On the back of that pamphlet we printed this little motto: "Labor legislation for the most part fails in its purpose on account of defective administration. Administration is the great problem of the future."

Last week we issued an enlarged edition of that pamphlet, including many

observations that we had made during the four years, and we print the same motto on the back of this revised edition.

Of course, one of the greatest movements in the country to-day is to prevent accidents. I know what wonderful work is being done by many of the large corporations and by such organizations as have been referred to here to-day. But the suggestion that the work of this commission should be to publish a volume of standards for safety does not appeal to me, because we all know that because of changing industrial conditions standards fixed in that way and published very quickly get out of date. That brings me to the one point that I want to make before this commission, and that is if the commission after its sessions and after it goes out of existence has not solved many of these other problems which come up for discussion in the regular field, if it leaves behind it an efficient machinery, whether State or National, to look after this great problem from the standpoint of the employer and the employee and the State, it will have done the greatest permanent thing that I believe it can do.

Now, shortly after issuing that little pamphlet in 1909 we made some study of the system that existed in England and of the system that existed in Massachusetts—the board of boiler inspectors—which was a little in advance of the establishment of the principle working now so well in Wisconsin; and we recommended in Massachusetts to a State commission studying the problem as you are studying it now a different form of organization for these State bureaus. Massachusetts is beginning on that work now and is reorganizing. Wisconsin during the same year took the same steps. During the present year five States have followed with a somewhat similar plan. To-day almost one-half of the industrial workers of this country are under the protection of this new form of machinery.

In this little plan that we have revised and brought out we attempt to show as well as we can the plan which seems to be working, and this chart is comprehensive and covers this labor field and shows the outlines for the machinery that we think is probably the one which is going to be followed all through the country in time. In addition to that we have prepared for our thousands of members throughout the country, who are represented in every State in the Union, a colored map which shows graphically just what is being done in these States as they build up the machinery at the present time. We are putting this out before our membership and before the public as the strongest kind of an indirect suggestion that we can make, and we are following it up with very direct work in the field.

On Christmas Day, for instance, we mailed to one of the States the first tentative draft of a bill for reorganization of these departments in that State. This work is going on. It is just as important as any other phase of the development in this field.

What I want to say in conclusion is this: That I believed that after this commission has studied and gone out of existence we are still going to have the labor problem, and that even if you do investigate present happenings in the labor world, like that at Calumet, we will probably have repetitions of those disturbances. This, however, provides something that you can not now provide in your existing organization. It provides the permanent machinery before which the people can come and work out in an intelligent, scientific way through advisory committees and through the State machinery the solutions of their problems. I thank you.

The CHAIRMAN. We are going to adjourn now for about five minutes and will reconvene immediately thereafter and will hear Mr. Herbert Quick.

(Whereupon, a short intermission was taken, at the conclusion of which the chairman called the commission to order.)

The CHAIRMAN. Mr. Quick.

STATEMENT OF MR. HERBERT QUICK.

Mr. QUICK. Mr. Chairman and members of the commission and ladies and gentlemen, when I was asked by the chairman of this commission to appear and talk about agricultural labor conditions, I felt very diffident about agreeing to come; and since I have been listening to the proceedings here and have noted the questions that members of the commission have addressed to people who have appeared, my original diffidence has gradually been transformed into something like panic. I trust that no member of the commission will call upon me to tell just exactly what I think this commission ought to do with reference to the conditions of agricultural labor. And I will say now in anticipation of

the repetition of the suggestion of one member of the commission, that this commission can do nothing except recommend legislation, that if that is all you can do, I have very little to suggest with reference to agricultural labor. I do not believe, however, that the commission, after entering into their great and important labors, will find that their duties and feel that their work will be entirely confined to the matter of recommending legislation. I think they will discover that there are some fields of the industrial life of this country that they will find themselves able to examine, analyze, describe, map out, and place before the people of the country in such a way that it will at least be recognized that there is a problem, whether there is any solution presented or not.

The agricultural industrial conditions are very difficult of approach. The subject comprises the largest body of unorganized laborers and unorganized employers dealing with the most important single problem in the life of the country. There are about 5,000,000 agricultural laborers in the United States, I believe, hired laborers. Their relations to the production of the country, their function in feeding and clothing the people of the United States and of the world, is tremendously important. They have no organization. We have no such things as these volcanic disturbances which the last speaker upon this floor described to you in this great group of laborers. It would be vastly more fortunate for us, I am persuaded, if we did have. The hopelessness or the difficulty at least—I will not say hopelessness—lies in the fact that there is no such community of thought, no such union of action on their part as to lead to any disturbance of any kind anywhere. And we have this great sodden mass, very largely of casual labor, scattered all over the country, and we are asked now to take up the question of looking into the matter and seeing whether there are any things with reference to this great body of labor which this commission can properly concern itself with. It is not even a question of one class of laborers. We have in the South one class of industrial conditions; we have even in the South decidedly different conditions in Texas from those that prevail in Virginia; we have the casual labor conditions of the great wheat State; we have the chronic scarcity of farm labor in the Middle West; we have the alternations between city employment and country employment, through which the problem of farm labor touches, and touches strongly, the whole question of labor in cities.

I was reading the other day a speech made by the chancellor of the British exchequer in opening the great land campaign in England, and in the course of his remarks he made the statement that a survey of the various industries of England and of Great Britain showed that the labor conditions in literally hundreds of occupations were profoundly affected by the conditions of agricultural labor. In other words, the interchange of laborers from ordinary city wage-earning occupations to rural occupations and the interrelations between the great fundamental industry of agriculture and the manufacturing and public utility interests are such that the consideration of agricultural labor in Great Britain is regarded as an essential part of the examination of the whole field of British labor.

Anything that I might say or that anybody else might say with reference to agricultural labor would be, in very large measure, inapplicable to agricultural labor in California. Anything that might be said about agricultural labor in California would need a great many modifications if it were applied to agricultural labor in Alabama. Nevertheless there are some fundamental principles, fundamental conditions, running through the whole matter of farm labor, which are at least of very widespread application, and it is with reference to these that I am going to talk to you a little while.

The problem is still further complicated by these facts: First, the employer of labor in agriculture is, to a very large extent, himself a laborer. The employer works alongside his man; he does the same kind of work that his man does. On thousands of American farms the agricultural laborer actually reaps more clear cash from his labor than his employer gets from his. The thing is further complicated by the enormous increase in tenant farming in the United States. I was born on a farm in the Middle West and worked upon the farm until I was 20 or 25 years old, and I am able to understand and perhaps to recall to the minds of most of you who know of probably the same fact some of the changes which have taken place in the last 25 or 35 or 40 years in rural conditions in the United States.

When I was a boy the farm hands of the neighborhood in which I lived—and it was true practically all over the United States—were recruited from the boys

of the owners of farms in that neighborhood. The owner of 160 acres of land who had a family of four or five or three or four boys would allow these young men to hire out to the neighbors, and the farm hand of that day was a member of the local community, a thoroughly prominent member of society, if he had the ability to make himself such; associated on terms of perfect equality with his employer and with his employer's sons and daughters and entered upon the business of a farm laborer—a field hand—for the express purpose of earning money enough so that he might buy a farm and become a farmer on his own account. That ambition was one which any young man might very easily and very hopefully harbor.

To-day the situation has changed to an enormous extent, and is changing with an accelerated rapidity. To-day the farm hand of the United States is in most cases a casual laborer. He goes from farm to farm seeking such labor as he can do. He is ordinarily a man who has lost hope; he is a bit of human wreckage; he has no idea of ever owning a farm or anything else, except the clothes upon his back; he is in Texas to-day, in Kansas next month, in Minnesota a short time afterwards; he starts at the Gulf and he follows the harvest fields until they end on the prairies of Saskatchewan; and then he drifts back to Chicago or some of the other large cities, accumulates disease, habits of dissipation, and gradually loses even the self-respect which causes him to work, becomes a tramp, and, at last, what becomes of him? That is a subject, gentlemen, for you to consider. I do not know what does become of the tramp finally. You know we hardly ever find a dead bird or a dead wild animal of any kind; somehow, when the time comes for them to die, they just disappear. Well, it is just about the same way with this human wreckage which drifts around across the country and to a very large extent mans the farms of the United States. In some mysterious way they disappear. They die, just how, just where, we do not know. Suicide, death under the trucks of the railroad train, in one way or another; murder, assassination. They amount to nothing in society, they have no ties anywhere, and they go, and nobody cares anything about it, and nobody knows anything about it. This is the laborer, in very large measure, whose relations in the United States this commission if it investigates the agricultural relations must consider.

Now, the field hands—the casual labor, the local labor—because there is some localized and residence agricultural labor in most neighborhoods, is only part of the problem, and if you confine your investigations purely to the question of wage earners you will have hardly reached into the heart of the question.

In the State of Illinois 53 per cent of the farms are tilled by tenants, so that only 47 farms out of 100 are under the control of their owners. Of those 47 men out of 100, they hire from 1 to 3 or 5 men upon their farm, so that the number of actual farmers—actual men resident upon farms who own their own farms—is reduced to a very small percentage of the actual hands engaged upon farms. The other 53 per cent of the farms are operated by tenant farmers. These tenant farmers in the main are under leases which terminate from year to year, so that 53 per cent of farm families in the State of Illinois—and it is only a little bit better in the surrounding States, I think it is 37 per cent in Nebraska, and there are some States, I presume, that are worse in this respect than Illinois—53 per cent of the farm families in the State of Illinois are homeless on the 1st of every March. These men who are engaged in tenant farming, some of them, are prosperous, but, in the main, if you will talk with anybody who understands anything about a rational, scientific, and humane system of farm tenantry, will laugh at the idea of a man making money on a farm, or making anything except a mere existence on the farm which he holds merely from year to year. Considered in one way, the American system of farm tenancy is the system which tends to rob from 25 to 50 per cent of the families upon the farms of anything better than they are now engaged in; and considered from the standpoint of the conservation of our fundamental resources, the American farm leases constitute a criminal conspiracy between the owner of the farm and the tenant on it to rob the farm of everything which can make it useful to posterity. These tenant farmers are not, technically speaking, wage earners. They hire wage earners to do the work which they can not do. And it is this class, in the main, who make less out of their farms than the farm laborers do whom they hire, considering the number of days' work they put in.

The lowest-paid class of laborers in the United States, I think, gentlemen, all things considered, are the tenant farmers of the United States. I do not believe that the sweatshop industry of the country can show as low a scale of remuneration as is shown, in the final analysis when you work out the actual number of

men, women, and children, upon the average tenant's farm in the United States. This is a labor question, an industrial question, which is perfectly enormous in its importance and very crucial in its import to the United States; very determinative of the production of our fields; very closely related to the question of the feeding of our increasing population.

Farm laborers are unorganized; farm tenants are unorganized; employers are unorganized in the agricultural field. This lack of organization on all sides is one of the things which I think this commission should study. The fact that in one State there may exist a plethora of labor and that in another State there may exist a scarcity of labor, and that there are now in existence no agencies of any consequence for directing labor, for intelligently distributing it, for advertising the fact of farm opportunities, for protecting the people who seek farm opportunities from the exploitations of unscrupulous people who are always advertising farm opportunities, is a matter which, it seems to me, this commission could very well consider.

In the main, as I see it, the change which has taken place in the last 40 years in American farm labor, is the result of the pressure of population, and the consequent increase in the price of farm lands. The farm upon which I was born a little over 50 years ago was at that time worth \$4 or \$5 an acre. It is now worth \$250 an acre. The price of land in the Middle West has risen, until there are very few portions of the agricultural world where land is so high. I believe that the average price of farm land in Iowa is considerably higher than it is in England. I think that in order to find farm land higher in price than that of Iowa, Illinois, Indiana, and some of our richer States, you will have to go to Holland, Belgium, and some parts of France and Germany. The condition is getting worse instead of better. It may seem rather surprising that I stand here speaking of the high price of farm land as an evil. Ordinarily, writers on economics are constantly referring to the increase in the price of land as an evidence of the prosperity of the community in which it occurs. There is no doubt that it is, to a large extent, a reflection of the ability to produce, of the community; but no one, I think, can examine the subject carefully without coming to the conclusion that farming as an occupation, is enormously prejudiced by the rapid increase in the price of farm lands; and this price in the last 10 years has increased on an average all over the United States to an extent equal to from 50 to 300 per cent, an increase in the price of land absolutely unprecedented, I think, in the history of any country in any age. This is an industrial problem of the gravest importance. It brings industrial disturbance and brings the necessity for industrial readjustments of a character that are basic and of tremendous importance.

Three or four years ago in my study of farming conditions—and this is a digression, ladies and gentlemen—I became impressed with the necessity of farm statistics, the great lack of accurate information as to what pays and what does not pay on farms. We are always talking to the farmer and telling him he ought to keep accounts. In the course of some years of examination I found he could not keep accounts, and no one of us could keep accounts, if we were on farms. Nobody can keep account on the farm if he is going to do anything else. It is a tremendously complicated problem. So with all the enthusiasm of faulty information, I started out to cure this evil, and so I made up my mind I would organize cooperative organizations for the purpose of keeping account. It was a perfectly fine scheme, to get the members of a farmers' club to agree that they would have a man who would keep their accounts and keep accurate statistics, so that every man would know just what every week's operation paid on his farm, exactly as Mr. Delano knows what the operation on his railroad pays.

So I went up to a little town in Wisconsin and made a speech and impressed those farmers to such an extent that they said they would like to go into it. I said all right, it will be good copy for me, and I will pay a part of this thing, and we will get the University of Wisconsin to delegate a man to do the other part, and you can pay part of it, and we will have a man who will act as statistician and accountant for the whole neighborhood; and they said all right, we will do it. I went down to the university and went to see the agricultural accountant and said, "I want you to get me up a system of statistics so we can absolutely figure out the profits of farming." He put me off from day to day and from week to week and from month to month, and said he would do it, and finally he said, "Look here, I can not give you any such system as that." I asked "Why"? He said "I don't know how." I said "I

will go to Spillman down here at Washington and he will give me a system." He said "I had something to do with getting up Spillman's system. It isn't any good."

I said, "Where is there a system that we can use?" And he said, "Nobody knows anything about it." I said, "We have been roasting the farmer for years because he has not kept accounts, and you agricultural economists do not know how to do it; how do you expect the farmer to do it?" He said, "Nobody knows how to do it." I replied, "I think we will figure out a scheme in a year or two." But he said: "The big problem is this: If Wisconsin land is selling for \$125 an acre, we will say, and it rents for \$3 a year, on a basis of a 20-year purchase, that land is economically worth \$60 an acre, but it will sell in the market for \$125. What are you going to do with the difference between \$60, the economic value, and \$125, which is the actual selling value of it? Are you going to charge that up against farming? If you do, it is unfair to the farm."

Commissioner BALLARD. Charge it to experience is what I do.

Mr. QUICK. Well, if you are going into the matter on this commission, you will have a great deal more than you can charge up to a superior. The fact of the matter is that the difference between the \$60 and the \$125 is an account which ought to be charged to land speculation, and it is that difference between \$60 and \$125 which is gradually dividing the rural population of the United States into an aristocracy on one hand owning property too valuable for the laboring man ever to acquire and a peasantry, the most miserable peasantry in the world, engaged in the work of doing the labor, and furnishing this agricultural labor which you are going to investigate upon these farms.

To-day farm land is going through the process which a handful of diamonds would go through, if you were to scatter a handful of diamonds about, and they were picked up by the people on the street. It might be said anybody has got just as good a chance to get a diamond as anybody else.

Commissioner GARRETSON. Do not look at me when you say that.

Mr. QUICK. I will try to refrain from it. But before those diamonds had been in the hands of the people who scrambled for them and picked them up, before the episode had been a month old, who would have the diamonds? The people who picked them up? No; the people who could afford to have diamonds would have them. And to-day if you would parcel out the lands of the United States, of the State of Iowa, for instance, where Mr. Garretson and myself were both born, if you would parcel out the lands of the United States into the hands of the poor people of the country, they would gradually gravitate into the hands of the people who can afford to hold an investment of \$125 that will only pay interest on \$60. That is the thing which is putting the lands of the country into the hands of the few and separating the poor from these lands.

Commissioner O'CONNELL. How about the common ownership?

Mr. QUICK. The common ownership of land is not recognized in this country. Of course, you do not mean common ownership. You mean probably the assertion by the community of that right to land which belongs strictly to the community. I might talk upon that and be very glad to. I think that is a question which will eventually have to be faced, namely, that the selling price of land, exclusive of improvements, is in no sense of the word the rightful property of any man, but belongs fundamentally to the community which produces it, and must be returned to the community which produces it, and when that is done this enormous selling price of land will be gone, and it will once more be within the power of the man who labors to get land upon which to labor.

When I was asked to appear before this commission, I wrote to two men asking what, in their opinion, ought to be done by this commission in the matter of agricultural labor. One man to whom I wrote was born upon a Wisconsin farm some 37 years ago, and grew up on a farm, and never did anything except the work of a field hand until about a year ago, when his ability as a writer was recognized, and he was suddenly lifted out of this farm, upon which he never had earned more than \$250 or \$300 a year as a field hand, and removed to one of the largest cities of the country and placed in an editorial position, where he is now making good as an editor. I wrote to him and told him I wished he would give me from his experience as a farm hand something of his views as to what this commission ought to do in the matter of agricultural labor. With the permission of the commission, I will read his letter. It is not very long.

This young man's name is William Johnson and he is assistant editor of the Farm Magazine, of Omaha, Nebr. He says:

"I confess to a good deal of scepticism as to the ability of any commission to cure existing difficulties. All the trouble arises from things that are largely fundamental."

I will state that this boy never had any schooling except that of the ordinary common school, and I regard his method of putting things as a fairly good re-utation of some things that I myself am going to say about rural schools. He continues:

"What Prof. Laumann calls the insurmountable 'individualism' of the farmer plays a big part in the situation. And you can't cure that unless you make farming something radically different from what it is now—different from what in the very nature of things it must be.

"The farmer is more independent now than he has ever been, and he knows it, subconsciously at least. He reflects it in his actions. Machinery multiplies the result of his efforts. He can till more land, and it doesn't make as much difference if a hired man quits now as it did in the days of the cradle or reaper.

"His very ability to till more land grows into land hunger. This means larger farms, busier owners, and more 'individualism.'

"It all works out to produce on the part of the farmer a feeling of secure aloofness."

It seems to me that in that sentence speaks the farmhand's realization of this growing social chasm between the farmhand who used to be the equal of the man he worked for and very frequently was the son of a richer man than the man he worked for and the present farmhand.

"He's independent of any set wage. A good year or a bad year, he still lives. It's being borne in on him that he is the most vital unit of society. He always has believed this, and now that the whole world is telling him so he has reached a mental secureness as to the verity of his position which makes him intellectually chesty." This does not tend to make him democratic in his ideals. The hired man naturally assumes much of the same status in his intellectual and economic scheme as his land, his machinery, or his live stock.

"As an inevitable result of this sort of thinking, into which the farmer has subconsciously grown, the hired man is made to feel that he is a part of the farm equipment rather than a part of the human element in the scheme.

"There are other reasons for this attitude on the part of the farmer. It is claimed with some justice that the character of hired help has materially changed in the last few years. This is true. But the farmer doesn't realize that his help has changed as he has changed. As the farmer has grown to be more of a master of his situation, the help has necessarily grown to be more of a servant."

In that sentence is found the old American idea of the difference between a hired man and a servant. I know when I was a boy a good Pennsylvania Dutch girl was asked by the village doctor, who came from from the East, if she would not come and help at his house, that his wife was ill, and that he had nobody to help in the house, and for Heaven's sake would she not come up and help. She was a magnificent cook, and she said, Why, yes, that she would go. She went up, and in the morning she got them a magnificent breakfast, set the table with a plate for herself, and sat down to breakfast with the rest of them. The daughter of the family said, "Mama, are we going to eat with the servant?" She said, "If I am good enough to get your breakfast for you, I am good enough to eat it with you, and after I have washed the dishes you may take me home. I am not anybody's servant." She was help. She was not a servant, and this boy in this sentence refers to one of the few relics of American independence that still continues to creep out in the remote districts.

Commissioner BALLARD. It is quite common and universal in Kentucky.

The CHAIRMAN. In the remote districts?

Commissioner COMMONS. In Kansas City.

Mr. QUICK. This letter continues:

"Those who are not of the stuff from which good servants are made have hunted other jobs. They have become land owners, renters, or have gone to the city. As a rule, one of two things is true of the man who works on the farm to-day. He lacks the initiative which makes of him a valuable helper, or he is in a tangle of circumstance that makes of him a hired man against his will.

And that tangle of circumstance isn't conducive to a free tendering of the best service.

"As long as the chance of owning a farm was open, there were plenty of good men willing to work on the farm until they could save enough to start. As this kind of opportunity grows less, this same class—the best help that any farmer ever had—grows less.

"If a man has ambition and energy, the qualities which makes him valuable, he isn't going to stay in a position that shows him nothing but an impassable barrier to anything better. It isn't human.

"I do not wish to be understood as saying that the farmer is harsh or autocratic. As a rule, I haven't found him so—assertively. It is a condition which is felt rather than expressed. The hired man sees his employer in a position of independence. This independence may not be as real as it seems, but everybody has told the farmer that he is the most independent man on earth until he has come to believe it, and the mentality of the average hired man is not bullet proof against this very contagious and flattering doctrine.

"Perhaps the forced convictions of his own narrow sphere, bounded by high-priced land, and an eight-months job on the farm, or the somewhat seductive view of the part played by a human atom in the city has given him a picture of the boss as being worse than he really is.

"Of course, you realize that long hours and the partial isolation of farm life have something to do with the scarcity of farm help. Man is a social animal—even though he be only a hired man. And a day's work overlong, together with an impoverished social life, turns a lot of men toward the town. Candidly, I don't think that this fundamental condition will be materially relieved by scolding about the deficiencies of the hired man.

"As to the conditions of sanitation and safety, these of course are no better for the hired man than for the boss. They are not the best in either case. But I think these two factors have little effect in either case. They are a part of the environment, and while they might influence a man who had come from the city to the farm, they are accepted with little criticism from those who have grown up under them.

"As I see it, the cure of the situation is more and better hired help in which the farmer can put more confidence and with which he can cooperate. This desirable condition can not be accomplished until some things are done differently. You can't get that kind of help until you provide the necessary conditions to attract them. That means a steady job, better wages, and being recognized as an equal. And for most men who will ever be worth anything in society, it means the hope of some day owning a farm.

"Going deeper this means, on the part of the farmer, diversified farming to provide work the year round; system to divide it into a fair day's work, and more profit to the farmer, so that he can pay bigger wages. Going still deeper and getting somewhere down to bedrock, it means that the average farm owner must get into this consciousness that he possesses a larger relation to society and a deeper obligation than that implied by the mere producing of food.

"In other words, until the farmer himself quits being a land hog and trying to corner his little part of the earth to the exclusion of other people, he won't be able to materially increase the hopefulness of the hired man or fill his soul to overflowing with holy and patriotic emotions. To those who have studied the land question, it isn't necessary to amplify this part of the theme.

"For the class who want to be home owners it means that some of the inflation must come out of land values so that a farm and the stars won't both look so equally out of reach. There is undoubtedly a large class of men who would make the best kind of help if fairly treated; in fact, I think there is a large percentage of men who are good for nothing else, and who, under sanely arranged conditions, would remain in this category quite to their own content and profit and contribute very largely to the stability of the rural communities. Given a steady job at fair wages, and provided with a house, garden, cow, and chickens, this type of man would be better off and would be a more valuable element, both in the social and in the producing scheme than he could ever hope to be as the owner of a farm. This may sound like rank heresy, but it is true.

"But the renter can't provide all of this; the average farmer won't, either because he is accursed with the somewhat doubtful blessing of acquisitiveness or because his natural sense of humanity has not been quickened. I am of the opinion that a lot of preaching which is being done at the hired man, and which usually fails to reach him at all, would be more profitably expended

in suggesting this idea to the fellow who hires the hired man. As I said, the renter can't provide these things, and the farmer is rapidly becoming a renter, either from choice or necessity. So there you face the other horn of the dilemma, and it's a doggone sharp one. What the solution of that is I haven't the slightest idea, and furthermore, I haven't the slightest doubt that every professor of agriculture in the United States could tell us all about it."

Commissioner BALLARD. Why do they adopt what seems to me to be an un-economic system of renting farms only from year to year? In Kentucky they rent farms as a rule for a period of years, and a man has a feeling of stability, and he rotates crops to the best advantage of the farm and of himself, too.

Mr. QUICK. It is owing to the fact that the American landlord is ordinarily a very ignorant person. The Kentucky landlord is evidently a person of more intelligence.

Commissioner BALLARD. I did not know that the landlords were usually so shortsighted. It would certainly seem that where there is a gradual annual increase in farming land, the farmer would certainly want the land for a period. Seriously, in Kentucky the farmer will rent a tract of land and have the same farm for years, and he gets the increment which comes from the increase in his live stock and in his fowls and such things, and he gets a good deal more out of the farm than the crop that he appears to sell from it. The land is perhaps growing in value, and he gets that benefit, and eventually he can buy a piece of land and become a renter and an owner combined.

Mr. QUICK. I hope to get to that presently. I shall talk for a very long time yet.

Commissioner LENNON. We have an engagement for dinner very soon.

Mr. QUICK. That will have to be postponed, Mr. Lennon.

Commissioner WEINSTOCK. I should like to ask some questions in connection with this.

Mr. QUICK. Presently I will give you an opportunity. The other letter that I have here is from Prof. H. C. Taylor of the University of Wisconsin, one of the greatest agricultural economists in the United States. He says:

"I am very much interested to know that the commission is to consider the subject of farm labor, but I note that it is especially labor under the employment of corporations, so that it is not especially the agricultural-labor question. Nevertheless, there are about 5,000,000 agricultural laborers in the United States who should receive some attention. The length of the working day, the conditions under which the laborers live and work from the standpoint of health and safety should receive attention. The wages and the cost of living of farm laborers should be studied from the standpoint of the relative chances of saving from the income received by the farm laborer when compared with the city laborer. One of the big problems connected with the agricultural laborer is that of getting the right man in the position. The people interested in agriculture are so scattered that there is great difficulty in getting intelligence into the movement of farm labor from the place where it is to the place where it is most needed. One of the things of first importance is the establishment of agricultural-labor bureaus which will serve as clearing houses. A study of the problem from the standpoint of what can be effectively done in this line should certainly be taken up. We are hoping in this State in the course of the next year to establish a system of employment agencies which will serve as clearing houses for agricultural labor. It is not simply the agricultural laborer who receives wages but also the tenant farmers who can be greatly benefited by such a system.

"A system of this kind would go far toward stimulating better agriculture, for the reason that many an employer continues to tolerate inefficiency on the part of men who if they were in danger of being dropped would pick up and do very much better, and if a bureau were in reach which could provide another man the change would at least be threatened. But the other side of the proposition is equally important. Many a laborer stays with a farmer under conditions which are entirely unsatisfactory to him, receiving less money than he is worth simply because he is ignorant of other opportunities. I want to see a network of agricultural-labor agencies, which will bring it about that the efficient farmers who treat labor well and pay it well can secure the best laborers, and this I believe will force the farmers who are not inclined to treat labor well to act in a more intelligent and humane way toward their hired help. I believe this will improve the help and improve the conditions of farm labor.

"The farm-labor problem is different in the North from what it is in the South, and it is different in Massachusetts from what it is in the Red River Valley, and again on the Pacific coast. A study needs to be made then of the farm-labor problem in the various districts in order to get a basis of action. A study way well be made which will give a picture of the present status, the trend of affairs, and the needs of the agricultural laborers and their employers in the various parts of the United States. I should think that it is entirely feasible to undertake such an investigation in cooperation with the economists who are interested in such problems in the various States. I mention the question of the hours of labor. This should be studied from the standpoint of variation from season to season and from the standpoint of variety of employment."

I think that is a very important point that professor Taylor makes.

"The question, also, of the cost of learning agricultural skill, on the part of adults who are thinking of entering agriculture from the city, should be carefully studied."

You could do nothing better on this commission than to show to the people who are engaged in this back-to-the-land mania, that a man can not work on a farm merely because he has two hands and a pair of legs, but also needs brains and skill.

Commissioner O'CONNELL. He wants to have his head with him.

Commissioner BALLARD. He will find it out for himself very soon.

Mr. QUICK. Yes. He says:

"It being borne in mind that those boys who grow up on the farm learn this skill at a time when it costs nothing. It is incidental to growing up, but the city man going into the country has much to learn and at a considerable expense.

"Yours, very truly,

"H. C. TAYLOR."

I agree with everything Prof. Taylor says, and I believe that along tactical and superficial lines—it is quite fashionable to oppose superficial things, but while the professor understands fully the more fundamental principles or recommendations that he makes, and, of course, they are not superficial in the sense that the man who makes them is a superficial man, they are not intended to treat the disease itself, but are useful studies as to ameliorating conditions which can be ameliorated.

Now, a word or two more. Two or three or four weeks ago I published an article in my paper, Farm and Fireside, telling about the experiences of several people who wanted men, one in New Orleans, one near Harper's Ferry, and another one somewhere else, who wrote saying they would like to get people who were industrious, energetic, and skillful, and that they would be perfectly willing to furnish the land and everything else as against the labor of those people if they were given a chance. Here is the bundle of letters which I received within a week or two on the subject, from people all over the United States, saying "For heaven's sake let us know where these men live, so we can write to them." One man is a lockkeeper in Kentucky, getting \$50 a month, and he wants to get onto the land.

Commissioner BALLARD. He had better stay in his business.

Mr. QUICK. Another man is one of a group of mechanics, Norwegians or Swedes, the best men in the world for farming purposes. This group of people wish to move onto farms. I brought this bunch of letters down here because they are really very eloquent in the light they throw upon agricultural conditions. If the commission desires I will leave the bunch of letters here, or I will take them with me and hold them at the disposal of the commission, because I do not wish to lose title to them. The letters themselves are very much more important than copies of them would be, because they show what kind of people wrote them, they show you how they wrote and how they spelled and what the language is and their evident sincerity. Would the commission care to have them?

The CHAIRMAN. We will be glad to have them. And if you will turn them over to Mr. Lauck, we will take care of them and return them to you.

Commissioner O'CONNELL. You say there is no organization either among the farm owners or the farm laborers?

Mr. QUICK. There is the I. W. W.

Commissioner O'CONNELL. I do not mean that. That is no organization at all. What has become of the organization of which Mr. Barry is at the head?

Mr. QUICK. It is an organization of farmers. It is not an organization of farm laborers.

Commissioner O'CONNELL. You said there was no organization of farmers.

Mr. QUICK. It is not an organization with reference to this matter of labor. It is largely a propaganda organization.

Commissioner O'CONNELL. It is organized in the interest of the farmers.

Mr. QUICK. Yes. There are farm organizations, of course—the Grange and the Society of Equity and the Farmers' Union.

Commissioner O'CONNELL. Should not all these organizations be consulted on this question?

Mr. QUICK. I think so.

Commissioner O'CONNELL. They are large organizations, some of them represent as many as a hundred thousand people.

Mr. QUICK. That is very true. They are very excellent organizations. But I mean so far as the relations of labor and the employer are concerned there is no organization on that point, no organization that is comparable to the employers' organizations which exist.

Commissioner O'CONNELL. The commission might get the idea that there was no organization among the farmers. There is very great organization amongst the farmers.

Mr. QUICK. Considerable organization. Of course, the American farmers are the worst organized body of farmers in the world except, perhaps, some oriental farmers.

Commissioner WEINSTOCK. Before you conclude, I wish to say that those two letters which you have read represent an unusually high degree of intelligence. The letters speak for themselves. Aside from the suggestion made by the writer of the last letter about establishing clearing houses and employment agencies, if the commission had to depend upon the information contained in those letters it would be up in the air. It would not know what to do. Now, it is possible that this problem may be insoluble. We do not know. But as an authority on the subject, and one who doubtless has familiarized himself with conditions abroad, I should like to invite an expression of your opinion upon this as a possible remedy. Do you think that laws that deal with the problem in the way that Great Britain deals with it in Ireland can be applied to this country? For example, you pointed out that the condition of the tenants is almost helpless, and that the condition of farm labor is almost hopeless so far as becoming a farm owner is concerned. You say further that land is held at a very high valuation in certain States.

Mr. QUICK. Yes.

Commissioner WEINSTOCK. That it is held above its productive power. Would it be possible for the States, if not the Federal Government, to follow the British plan of condemning those lands at whatever valuation may be determined upon in accordance with law, or buying the land, issuing State bonds at a low rate of interest, or giving a bonus as they do in Great Britain to the Irish landowners, and then cutting up those lands into moderate parcels, enough to support a family, and selling the land to the farm tenants or farm laborers who are not absolutely penniless, but have some little money, selling them on the amortization plan, that is spreading the payment over, say, a minimum of 30 years, which would mean the payment of 1 per cent only on the principal annually, with a very low rate of interest, thus enabling these farm tenants and farm laborers to become actual farm owners, as they have become in Ireland, where over 300,000 tenants have been converted into 300,000 farm owners, making Ireland to-day one of the most prosperous countries in all Europe. Is that practicable here?

Mr. QUICK. Given the development of public opinion necessary, I should say yes. Of course, before we get to that point, I hope we will be able to do better than they do by that system. The housing problem in the country is very important. It is as important in this country as it is in England, and Lloyd George gave a great part of his speech at Bedford, in beginning the land campaign there, to the question of housing. The farm hand can not marry, can not support a family, has no place to live. A farmer will not ordinarily take two or three acres from his farm and put up a house there for his hired help. The housing problem in this country, so far as farm help is concerned, is a tremendously important problem. It is a problem the solution of which is absolutely essential to the farm labor question.

Then, there is the question of the security of leasehold tenures, on which one of the members of the commission has just spoken. I think you might well study that. I suggest that you study the question of housing for farm laborers, so that laborers may have families, and a few acres of land upon which they can grow chickens, and have a garden and perhaps support themselves.

I think perhaps you might well study the question of farm leases. It is a very important question. We ought to have leaseholds in this country and we ought to have laws that would require the landlord to give a good reason before he dismissed a tenant from his farm, whether or not the lease had expired, and when a man is disturbed in the possession of a farm, he ought to be paid every cent that he has in it in any kind of improvements, including fertility and the condition of the soil. The tenant who loses the farm, whether or not his lease has expired, should be paid every cent that he has put into it, so that the fertility of the land can be considered, and so that the tenant can reach the point which the European tenancy has reached, a condition in which the man who is a tenant upon a farm is expected to live there, and his children and grandchildren after him; until we have reached that point our fields are going to decrease constantly in fertility, and the production of our acres is going to become less and less. I can take you all over the country to lands that have not been under cultivation more than 30 years, upon which they never again will grow the crops that they grew originally.

That condition is not necessary. They could be restored to their pristine fertility by a few years only of good husbandry.

Our whole system of farm labor looks as though it had been devised by some diabolical malice for the ruin of our farms. That is a very important matter industrially.

And then I think this commission might well go into the question of the system of taxation, because after all the system of taxation is at the basis of this whole thing. These enormous land values which have accumulated do not belong in justice, in equity, in morals, in common sense, or in any other point of view, except in law, if you will permit me to express the opinion, to the people who own the farms. They are the creation of community activities. They are collective products. They ought to be taken in the form of taxation before we call upon people to pay out anything which they themselves have individually produced, for the support of the Government. If this commission could investigate the matter of the taxation of land values, which is the coming issue in England, New Zealand, Australia, Denmark, and Eastern Canada, and if the commission could propound to the country a method by which the water in these farm-land values could be squeezed out, so that this charge on a prime necessity of life should no longer continue, I think it would do the country a very great and eminent service.

Commissioner GARRETSON. A good union man is being dominated by single taxes.

Commissioner WEINSTOCK. Coming back to that suggestion, you say that in your opinion the Irish landlord system could be applied to this country provided you could create sufficient public sentiment to stand behind it. Is there any good reason why this commission should not endeavor to arouse public opinion along those lines?

Mr. QUICK. I see no reason why it should not. It seems to me that the commission, in dealing with rural conditions, can not avoid this land question in some form.

Commissioner WEINSTOCK. Touching upon the housing problem which you have spoken of in connection with farm hands, do you think that the French system would be applied here? The French system is substantially this: There is in France a great contributory pension fund that the workers and employers must contribute to. The Government takes that fund and loans it under State management at 2 per cent a year. Plans are prepared in the most scientific manner for the building of the homes of farm laborers. Every part of the building is standardized so that it can be manufactured in great quantity at the lowest possible cost. The supervision of the construction is by the State. The house is sold to the peasant on the amortization plan. He pays 1 per cent a year on the principal, with a graduated scale of interest, based on the number of his children, not less than $1\frac{1}{2}$ and not over $2\frac{3}{4}$ per cent; so that to-day the farm laborer in France pays less for a modern, scientifically constructed home than he formerly paid for his wretched, miserable hovel that led to a higher degree of mortality in the country than they had in the cities.

Mr. QUICK. We have in the United States a higher rate of mortality in the country than we have in cities.

Commissioner WEINSTOCK. Exactly. Would a plan like that be a wise one for this country to follow?

Mr. QUICK. I think it would probably be wise to investigate that system very carefully before recommending it to this country. I should hate to see a system of peasant proprietorship established in this country, of small holdings, not large enough to sustain a family on the American scale, surrounded by large estates. I am opposed to the Government entering actively into the real estate market and booming the prices of land still higher by any large scheme for purchase. I think that if the scheme of concentration of taxation upon land values is to be adopted in accordance with the social program in the way of better schools—I wish I could have had time to talk to you upon the subject of rural schools.

Commissioner LENNON. That is the most important point of the whole. I am a farmer myself.

Mr. QUICK. But that does not come under the subject I am talking about to-day. But if their social program were adopted that would absorb a sufficient amount of the ground rents of lands exclusive of improvements so as to penalize monopoly of land and reward the improvement of it, then in connection with the gradual reduction of the price of farm lands on account of the concentration that a gradual pressure of taxation in favor of improvements and against monopoly would lead to, then I think with that might go a system of establishing freehold estates large enough for the support of a family.

Commissioner O'CONNELL. You would tax the land and not the improvements?

Mr. QUICK. Yes.

Commissioner WEINSTOCK. The Government of France does not buy the land. It simply buys the mortgages on it.

Mr. QUICK. That is merely another way of accomplishing the same thing.

Commissioner WEINSTOCK. Yes. The mortgage is issued and the Government invests in the mortgage. It does not own the house.

Mr. QUICK. There ought to be some way in this country for people like many of those who have written these letters, people who have integrity, enthusiasm, desire, and skill, to be placed in the locations that are waiting for just such people, and there ought to be some way by which a man could realize on his honesty, integrity, and the ability of his hands. That is a very important thing.

Commissioner DELANO. What do you mean by the minimum size? What is your idea of the minimum size?

Mr. QUICK. Under average American conditions the small farm—you have got to take people as they are, and I do not believe our people in this country could make a living under ordinary conditions on farms the size of those that are farmed by the Hoosemen of Denmark. Of course, we could not do it on the size of the farms in China and Japan, where in some parts of China strictly agricultural lands maintain their population of 3,200 people per square mile. Now, somewhere above that, it depends upon the economic conditions, the markets, and everything of that kind in a particular location. In the sand hills of Nebraska, 2 square miles ought to go to every farmer, and that would make him a very good living. In the trucking districts of Florida 3 or 4 or 5 acres are enough. And there are the little landers around in southern California who are making a living on still smaller areas than that. But in the main I should be sorry to see lodged in the midst of large farms, small holdings which would be just big enough to anchor a man to the spot, not being big enough to furnish him a living and force his daughters and sons to become servants of the large estates with which he was surrounded. I hope not to see that condition in America. And that would probably be an improvement over the present condition, where men simply drift from farm to farm. They are hardly considered human beings.

Commissioner WEINSTOCK. Has that been brought about by virtue of the tremendous progress which has been made in agricultural labor-saving devices, so that the farmer no longer needs his laborers the year around—it has become a seasonal occupation?

Mr. QUICK. Mr. Johnson speaks in his letter about the necessity of diversifying his work so as to provide work for his laborers the year round. You are quite right in that.

Commissioner GARRETTSON. One question for my information. What is the going rate for rental of land in Iowa now?

Mr. QUICK. I do not know. I have not made any investigation of that for some years.

Commissioner GARRETSON. I did not know but maybe you did know.

Mr. QUICK. I know one man in eastern Nebraska who claims to receive \$8 an acre.

Commissioner GARRETSON. Well, the going rate in the county I live in is about \$6, but I did not know what it was in the rest of the State.

Mr. QUICK. I suspect it is about the same. You see, the western part of the State now has become, if anything, richer than the eastern part agriculturally. I think probably you could take that as the going rate.

Commissioner GARRETSON. That is in the \$200 belt?

Mr. QUICK. Well, there is nothing else in Iowa but the \$200 belt.

Commissioner LENNON. In McLean County, Ill., now, there is some going for \$10, but I think it will average \$8.

Mr. QUICK. But, on the other hand, go to England and take a man who has a 200-acre farm. He pays £3, or \$15, a year rent. He dines upon silver plate, has a coterie of servants, and makes more money than the American farmer does, and he does it under the free competition of all the world; he sells his wool against free wool of Australia; he sells his beef against the free beef of Argentina and the United States; he has no protection of any kind in law, and the only reason why he can do it is, first, because he has a good soil, and, second, because conditions in England are such that the good farmer is sure of his farm from generation to generation. And if that were true in Iowa, in 40 years from now Iowa would produce twice what it produces now, and the men who were renting the lands, if we still continued to tolerate the system of private monopoly of land, would be getting from \$10 to \$15 per acre for their land if money continues to be worth what it is now, and the tenants on the land would be making fortunes and their leases would be worth fortunes, and down underneath them would be a lower peasantry.

Commissioner WEINSTOCK. Is it not unusual for a farmer or one representing farmers to be a single-taxer?

Mr. QUICK. Not very.

Commissioner WEINSTOCK. I thought the agriculturists were bitterly opposed to single tax.

Mr. QUICK. A very intelligent gentleman in Nebraska, Mr. Frank B. Odell, sent out a question to several thousand farmers in Nebraska asking them as to the rural conditions, how efficient they were, what per cent efficient are your schools, and so forth, and among others the taxation system. Ten per cent of the farmers who replied were openly in favor of the single tax; enough more so as to bring the amount up to 35 per cent answered in such a way as to indicate that their thoughts were running along the line of land-value taxation. So, of course, it is perfectly easy to show to a farmer of open mind that unless he is the owner of a large and largely unimproved farm he would be greatly the gainer by it. He would lose in the selling value of his farm, but as a producer, as a tool of production, he would be vastly better off in ordinary cases. In Clackamas County, Oreg., the land-value taxation assessment was made to show how it would work. It works almost automatically against the owner of large areas. The owner of 100 acres, we will say, would pay just about the same amount of taxes under the land-value taxation scheme as he does now. If he owns 200 acres he would pay very much more than he does now. If he owned 80, 60, or 20 acres, his taxes would be very much decreased on account of the very large proportion which would go to improvements. Of course, the tenant farmer would not pay anything in the way of taxation. I think while in the main the average farmer does think that the single tax is some scheme for extracting his farm from the surface of the earth like a decayed tooth, and leaving him in the bottom of the hole, that the number of farmers who see the fallacy of that is getting more and more all the time.

Commissioner O'CONNELL. Are we making any progress in the single-tax way, do you think? This is outside the regular debate.

Mr. QUICK. It seems to me, if I may be permitted to answer that question, that it is growing faster than anything else has ever grown in the way of fundamental reform. The influence of it is coming faster than we are able to take care of it.

The CHAIRMAN. We are very much obliged to you, Mr. Quick. Now, Mr. Charles W. Holman is here on this same subject, and I think perhaps we can hear him before we adjourn.

STATEMENT OF MR. CHARLES W. HOLMAN.

Mr. HOLMAN. Mr. Chairman and members of the commission, it is very difficult to discuss any farm questions with any group of people, because everybody has either been a farmer, is a farmer now, or expects to be a farmer. For that reason there are so many different ideas that it is difficult to present the question. Mr. Quick has covered the general outline of this question, and I shall only devote a few minutes to discuss a few phases of the labor and capital relations that the farm movement has developed.

In the first place, the United States is one of the latest countries to come to a realization of the fact that, looked at from the point of view of labor organizations or of the labor movement, a land policy of a national and a State character must be adopted. As to what that land policy is remains to be found out.

There is another point in connection with this, and that is some of the fundamental changes which have been taking place in the organization of agriculture. Among these the two greatest are, first, the tendency toward the factory system of farming, which is spreading throughout the corn belt, which is gaining greatly throughout the cotton belt, and which is making big gains in the Pacific-coast regions, and which is also making some gains in the Atlantic-seaboard region. The second is the cooperative movement of marketing of farm products, which has developed into a series of business organizations and a series of organizations for the transformation of farm products before they reach the market, which will greatly change the aspect of farm labor in this country.

There is another element which we must consider in dealing with this problem, and that is that the same line of evolution has taken place in agriculture that is taking place in city industries, namely, the lines of demarcation of labor and capital. We have in this country 5,000,000 transient laborers, and we have also a great many more people represented in the landlord and tenant movement. In both the landlord and tenant problem and the wage-labor problem we have the growing recognition on the part of the laboring people of the fact that their interests are not in touch, from their point of view, with the employing types and the owning and renting classes. We have the constant feeling on the part of the farm laborers, as Mr. Quick's letters show, that he is an outcast. We have on the part of the tenant the same growing feeling that his interests lie with those of the laboring classes.

Now, there are lines of connection between the farm laborer, and by the farm laborer now I mean both the tenant and the wages laborer, and the wages laborer in the city. We are to-day confronted with an enormous problem—the surplus labor in our city—and, looking at it from our point of view, we should study this rural problem and ascertain whether we can find employment for our wages labor that is in the city, and if it develops that we can not find employment we should take some means to see if we can counteract the cityward movement of the farm population. Through all of the southwestern country which I represent and through which I have lived for a number of years there is the same tendency on the part of the farm laborer to move to the city that you have throughout the Middle West. That, of course, complicates the problem in the city, which it is not necessary to discuss before this commission.

Another point I would like to bring up is this fact, that most of the people look at this agricultural problem as the problem of the individual farmer and individual laborer. That is changing very rapidly in this country, and we have constant aggregation of ownership on the part of a growing smaller class; we have the development of the bonanza farm, the 2,000-acre farm is very common in the South; we have the cotton problem down there; we have the changing of the landlord and tenant system going on to the system of operating these tenants as wages laborers; and we have those conflicting problems which come up and which must be solved.

Backing that up, you have the housing question which Mr. Quick has touched upon. I would hate to describe to you the tenants' homes and the farm laborers' homes which I have been in in the last five or six years while doing field work and investigating these particular problems.

Then with that tendency, which has taken place with the rising land values, you have the desire on the part of the landlords, in many cases, to sell their land. We have the immigration movement which is trying also to locate these farmers upon the lands. Now, the point that we wish to find out is whether these things can be done. We should also look into the question of a freehold

as against a leasehold, as against possibly the purchasing acts. There are some very interesting data that could be gathered and presented to the American people along that line. I think this commission should take some action in recommending whether there should be a national policy or a State policy in the way of legislation along this line. That is all I have to say.

Commissioner WEINSTOCK. I move that when we adjourn we adjourn to meet to-morrow morning at 9 o'clock.

The CHAIRMAN. There are several other gentlemen here; but, if it is the idea of the committee, I think perhaps it might be well to adjourn now until to-morrow at 9 o'clock. It is 6 o'clock, and we have had a long day.

Commissioner BALLARD. Before you adjourn, I would like to ask the Wisconsin gentlemen one question which can be answered "yes" or "no," and as they are not to be with us to-morrow, perhaps, Mr. Beck can answer it. Mr. Cameron showed us a picture of an employeé, in some factory, who had been cautioned to wear glasses, for two years he had refused to do so, and subsequently his eyes were put out because he refused to wear glasses—

Commissioner GARRETSON. I do not think any of those gentlemen are here, Mr. Ballard.

Commissioner BALLARD. Perhaps Mr. Commons can answer the question. I will ask it some other time, however. I wanted to know whether the man is getting insurance under your State law, as if it had not been his fault.

Commissioner LENNON. Yes.

Commissioner DELANO. They do not look into causes.

Commissioner BALLARD. There is no contributory negligence clause in the act.

Commissioner GARRETSON. That has been abolished.

(Thereupon, at 6 o'clock p. m., the commission adjourned until Tuesday, December 30, 1913, at 9 o'clock a. m.)

WASHINGTON, D. C., *December 30, 1913.*

The commission met, pursuant to adjournment, at 9 o'clock a. m.

Present: All the members of the commission.

The CHAIRMAN. The commission will come to order. Mr. John A. Fitch is present, and he is in a hurry to get to some other place, so we will hear him first.

STATEMENT OF MR. JOHN A. FITCH.

Mr. FITCH. Mr. Chairman and members of the commission, I have come down here with a large collection of suggestions; but I was a little uncertain as to what I might do to justify the commission in asking me to come down here. If I were to try to suggest a line of inquiry that this commission might follow, I would be likely to mention those things in which I am most interested, and it has shaped itself in my mind something like this: The commission was asked to investigate the causes of industrial unrest. If we are to find out that situation we will have to find out what the opportunities are which are open to wage earners to better their conditions, because I take it that the unrest is due primarily, without going into details, to obstacles that stand between the wage earners and improvement in their condition.

Now there are three ways that are commonly spoken of through which wage earners can accomplish that. One is through legislation, the public insisting upon improvement in hours and sanitary arrangements, and so on; one is through voluntary action on the part of the employer; and one is through collective activity on the part of the employees. Now, all of those three are tremendously important. My work has been such as to familiarize me perhaps a little bit more and make me a little more interested in the third manner of improving conditions than in the other two, although I do not detract from the importance of the other two. I take it that other people will speak of those things and that they will be fully considered by the commission.

But considering the opportunities open to wage earners through collective activity to improve their conditions, what are those opportunities? I was greatly impressed by what Mr. Quick said yesterday, my experience in life having been so similar to his, without having nearly so much of it and in so varied a way, and my memory not going back so far as his, still I have seen the same things happen a little farther west than Mr. Quick's experiences, and I am sure the things he outlined are happening. I remember when it was possible for a young man to begin work on a farm and after a while to own a farm;

and, although I am a younger man than Mr. Quick, I have seen that happen and have seen it pass away, and now it is not possible for that to be done. There was a time when there was that opportunity for wage earners who had failed to improve their condition as fast as they would like; there was a chance for them to go to the farms. I think that chance has been largely taken away. The biggest opportunity that the country ever held for improvement through individual activity in economic conditions has been taken away. We must then consider what the opportunity is for improvement through collective action.

I assume that the legal right to organize is conceded. It is not always conceded, and there are legal obstacles, but that is not a thing that I wish to speak about. Assuming the legal right to organize, there are three tremendous obstacles, as I see it—or perhaps two—that do stand in the way. One is economic conditions, the change in the character of our industries, the change in the way in which things are made in the factories, the change from dependence upon highly skilled craftsmen working with their hands to dependence upon machinery turning things out automatically at a speed never dreamed of by the earlier craftsmen. That thing has happened in practically all industries. It has lessened the dependence upon the skilled man until the unskilled man is coming to be a strategic center in industry instead of the skilled man. The unskilled man is coming more and more to be an immigrant, a man unacquainted not only with our customs and laws but with our language. We have not a homogeneous labor population even to the extent, as was once the case, when our common laborers were Irish. We now have a dozen nationalities not knowing how to speak each other's language; therefore common activity is extremely difficult. Not only that, but the skilled trades which were once in a position of strength and were able to organize are finding that their opportunity to work is taken away.

For example, the glass-bottle blowers still have an organization, a good, lively organization, but they are beginning to make glass bottles by machines instead of by man power. The end of the glass-bottle industry seems to be in sight, so far as the individual is concerned. These old men will still live, but their sons will grow up, and what opportunity lies before them for improving their condition as craftsmen, as skilled laborers, through collective activity? I need only mention that. There is a great difficulty that needs to be worked out. The possible change in forms of organization, the entire line of attack of organized labor, will have to be changed. And the kind of organizers they get; no longer can they send them out as formerly they did, but they need a dozen nationalities of organizers in order to reach the situation. No longer will the same appeal be effective. They need to appeal to a different class of men, and so on.

Now, the next obstacle that I am impressed with is the objection on the part of the employer; that is, evidence as a direct opposition, the discharging of employees who endeavor to organize, the blacklisting of employees who have been discharged for that reason; the checking of organized activity through the fear of those things.

Then there is an indirect opposition which manifests itself in a hundred ways. I do not wish to speak categorically in regard to these things, but I wish to suggest the possibility of investigating those more subtle influences which tend to prevent organization.

Mrs. Robins spoke yesterday of what has been called welfare work. It is difficult to say what welfare work is; it means one thing in one place and another thing in another place, and what one person will call welfare work another will indignantly repudiate and say that is not welfare work. There are a large number of activities, however, which are frequently referred to under that head. A very great many of them, whether they exist for the purpose of preventing organized activity or not, have the inevitable tendency to work in that direction. For example, pension schemes. Now, we have not in this country any Government system of pensions for taking care of superannuated workmen. Something must be done. I do not see how a humanitarian employer who has a large number of employees can avoid seeing his responsibility there and doing something about it. A number of large corporations are doing it. The United States Steel Corporation, the American Telegraph & Telephone Co., and the railroads, and some of the large packing plants, and so on, have adopted pension schemes. So they say, when a man has been in the employ of the company for 20 years and has arrived at a certain age, he may be retired and for the rest of his life draw a pension from the company. Those things must be taken care of, it seems to me.

Another thing is profit sharing. That has been worked out in one way or another in different communities. Another is voluntary saving. All of those things represent a certain obligation that an employer has to his employees, and humanitarian employers have tried to work them out, but in working them out what has been done?

The employer must, it seems to me, have a stable labor force. He needs that as badly as he needs anything else, I judge, from such slight opportunity as I have had to observe conditions and observe what the employer's needs are. No one can object to the employer's desire to maintain a stable force and keep his men in his employ. The employer in endeavoring to work that out has taken advantage of pension schemes and profit-sharing schemes, and compensation schemes, etc., to encourage his employees to stay in his employ, by offering them something which perhaps others do not offer. So in the pension scheme they say if you stay 20 years in my employ you may draw a pension. In profit-sharing schemes, take the United States Steel Corporation, for instance, if you stay with us five years you will draw a bonus each year, and at the end of five years you will draw an additional bonus, if you are still there. In the compensation scheme of the United States Steel Corporation, if you are in the employ of the corporation one year and are hurt you will draw a certain compensation, and after five years your compensation will be more, and after a certain other number of years it will be still more. So a man who has been with the company 20 years will receive a still higher rate than a man who has been in the employ of the company only 1 year, even though he is hurt in the identical manner.

Those things undoubtedly are done for the purpose of keeping a stable labor force, a perfectly legitimate desire on the part of the employer. But what is the effect upon the mind of the employee? Most of these plans say definitely that the employee has no rights in the thing that is offered. Not only has he no right to a claim on the company for fulfilling what it has offered in the way of a pension scheme, for example, but the company is under no obligation to maintain that system. And a number of pension systems with which I am familiar say definitely, and I think most of them imply without saying so definitely, that if at any time it seems desirable to the employer the pension scheme may not only be modified but it may be entirely done away with, if that seems necessary.

Now, what is the effect of all that? The employer has offered a certain kind of employment and a certain wage. In addition to that he has offered something else, a pension possibly, or a right to participate in an advantageous profit-sharing scheme, and so on, all of which is dependent upon a certain number of years' service, and that in turn is dependent upon something which the employer calls loyalty. All of those things I do not begrudge the employer at all; I should think those would be the things he would want to do, but I am obliged to point out that it has a certain effect in restricting the freedom of activity on the part of the workers, which will tend to enable him to take voluntary action to better his condition through his own efforts instead of depending upon some outside activity.

What is loyalty, for example? The rules say the employee has no right to be maintained in the employ of the company; therefore, if he is discharged he has no right to participate in his employer's offer. The employer necessarily is the judge as to whether or not he is loyal. Would it be loyal to organize a union? Would it be loyal or not to do that, but just organize a committee and go to the employer and ask for a reduction of hours of labor or an increase in wages? Well, perhaps that would be perfectly proper, and with a large number of employers I think that they would consider that not incompatible with a proper degree of loyalty; but the employee is not always sure of that; and not only that, but he knows very well that in many industries in other sections of the country, perhaps among his friends, men have organized committees and have gone to the employer and have asked collectively for an improvement in labor conditions and they have been discharged for doing it. Can we afford, they must say, to jeopardize our position and so jeopardize our right to participation in this pension fund, by trying to get this temporary improvement in conditions? What would be the effect? Some of them may say that remote opportunity offered for improvement is so much more remote than the opportunity for improving conditions right now that it will have no effect. That probably would be true with an employee who has been one year in the employ of the company but how about a man who has been in the employ of the company for 15 years, and who in 5 years more will be eligible

for a pension? The effect upon his mind will be to make him much more cautious and much more conservative and to hesitate a great deal longer about protesting against something which he believes is bad in the present scheme of employment, but which he thinks perhaps he can put up with for 5 years and then get the pension which is offered.

Now those things I consider some of the most subtle influences at work against organization, against the opportunity for collective action looking to the betterment of conditions. That was all that I had in mind to say.

Just one other thing I would like to add, however. The question was raised yesterday, and it was suggested that the employee asked for protection under the law that the employer does not have. That having laws to protect him; there is no need for further extension. That idea was suggested, that was not said. I just wanted to lay before you three concrete things that have come under my personal notice as to the way in which the law does protect an employee who may want to improve his condition through collective activity.

I was in Alabama about three years ago collecting material for a magazine article, and I walked about in some of the coal-mining camps outside of Birmingham. I was met at the edge of a mining camp that I tried to go into and walk through and observe the housing conditions, and so on, by a man who was carrying a gun; and he wanted to know what I wanted, and I told him what I was doing. He explained that he was in the employ of the coal company as a guard, and when I had told him I was a magazine writer and was collecting material for an article, he said I could not come into the camp, and I asked him why not, and he finally told me that he was employed by the company to keep two classes of people out of that camp, and he was to keep out labor organizers, and people who might be trying to employ labor and take them away. I was a good deal impressed with that, because there was a good deal of inactivity in that region at that time and a lot of miners were out of work. He said that what I said might be true, of course, he did not deny that, but after all, I might be a labor organizer and might be there to employ labor, and his instructions were to keep people from doing either of those things.

I am not saying what conditions were there, but if they had been bad and I had come there to tell the employees of some way in which they could improve their condition by collective activity, I would have been prevented from doing it by this man with the gun. There were men out of work there, and if I had come to offer them a job to support their families, I would have been prevented. The Alabama law says you can not take labor out of the State, but the law does say that you may organize, and so this man with a gun, who was a deputy sheriff, actually would have prevented the doing of that legal thing.

A year or so before that I was an employee of the New York State Department of Labor, and I investigated a paper strike in northern New York. At Corinth, N. Y., during the course of that paper strike, a large number of reputable citizens told me and made affidavit to the fact that while strike breakers were being brought into that paper plant, some of them tried to get away and not go to the plant, and that the militia who were on duty at the time guarded them and compelled them to walk from the depot to the mill, and when they tried to get away, in some cases attacked them and beat them with their guns.

The third thing that I wish to mention is the fact that in Paterson, N. J., last summer two men were arrested who were engaged in leading a strike, and they were sentenced to six months in jail, and did serve about two weeks in jail. When finally the case was reviewed before a supreme court justice, the justice found that not only were the men not violating any law, but they were cooperating with the chief of police in carrying out his orders at the time that they were arrested.

Those three things have impressed me that sometimes the law does not work in protecting the interests of employees, and something needs to be done to see that the law does work.

Commissioner WEINSTOCK. With your permission, I would like to bring out some further points in connection with your statement. The first thing which you brought out on which I would like to have further information, and I am sure the other members of the commission would also like to know, is the point you made that the unskilled man is coming to be the strategic point; and I gathered, practically, from what you said that labor-saving devices are killing the skilled worker, so to speak, as a skilled worker.

Mr. FITCH. Yes.

Commissioner WEINSTOCK. Now, I have read many economists who have taken the ground that labor-saving devices do not rob men of work, but that they create work for men; that is, they have such a potent influence in reducing the cost of production that they increase the demand, and that in turn opens out new avenues for labor.

To illustrate, take a concrete case, the typesetting machine, for example. It is pointed out that the typesetting machine threw many compositors out of work, and to them it was in the nature of a calamity if they could not readily adapt themselves to the new condition, because it made of them unskilled workers. But, on the other hand, it reduced the cost of printing newspapers and printing magazines so materially that it made the 1-cent paper possible on the one hand and the 10 or 15 cent magazine possible on the other hand. That in turn created a very greatly increased demand for such publications placing them within the reach of millions that theretofore were unable to buy them, and that in turn again created employment for untold numbers.

Now, is that economic claim sound or unsound, as the result of your observations and investigations?

Mr. FITCH. I have no doubt that what you say is true; that that claim is sound; that the introduction of labor-saving devices does decrease cost eventually. It may not at once, on account of patent laws, and so on, but there is no question it will eventually. But notwithstanding, the grade of labor employed has been permanently lowered. The proportion and number of skilled employees needed has permanently been lowered and the scale of wages has permanently gone down for that class of men. There is no longer any employment for them in their skilled trade. They have gone beyond the point where they can learn a new skilled trade, and even if they could, they would have to displace other skilled men to get jobs. Therefore, the whole tendency as regards labor is downward when you invent a machine which throws a lot of men out of work. That is good for society from the standpoint of production, but it is bad for the men who work.

Commissioner WEINSTOCK. Assuming that is correct, the question, I think, that is important for the commission to consider or, for me, at all events, to know is this: Admitting that that is an evil—that is, the lowering of the standard of the average—admitting the conditions whereby a limited number of skilled employees can get employment at a high wage and the number of unskilled can get no work; admitting that that is an evil, the question arises which of the two evils is the lesser evil, from the standpoint of society generally? What would be your answer to that?

Mr. FITCH. If you mean do I believe that the question could be solved by stopping the invention of labor-saving devices, I do not think that. I think the saving of labor must eventually work to the good of the workingman whose labor is saved, as well as it works to the good of consumers. But what we need to-day is to examine what happens to workingmen who are thrown out of jobs; what machinery we have, if any, to take care of men who through no fault of their own are thrown out of a job, who represent a problem of unemployment which, you might say, we are the beneficiaries of. We have a tremendous responsibility to an unemployed man who is thrown out under such conditions as that. That is a point I have not investigated and have not examined, whatever may be suggested in the way of taking care of that situation, and I do not feel like making that suggestion myself at this time.

Commissioner WEINSTOCK. Briefly, of course, the prime object of this commission is to pick out the underlying causes for industrial unrest. It is very important for us to be guided and directed by experts along the lines of discovering the prime causes of industrial unrest; and I feel it would be very important for me to have made clear in my own mind as to whether the invention of labor-saving devices is one of the prime causes for industrial unrest and whether it makes conditions on the whole and in the end worse that they were before. I have been led to believe, as the result of my reading and observations and investigation, that on the whole the results of the introduction of labor-saving devices are beneficial, but I have an open mind.

Mr. FITCH. I agree with you absolutely; they are beneficial.

Commissioner WEINSTOCK. And if it could be shown they are not beneficial, I would be quite willing to accept that as a fact.

Mr. FITCH. I merely want to suggest the incidental damage that is done by them and to ask that the commission will inquire as to the extent of that and as to the possibility of repairing that damage.

Commissioner WEINSTOCK. That is minimizing the result?

Mr. FITCH. Yes; exactly.

Commissioner WEINSTOCK. I take it, then, that you are in accord with the idea that you can make no change of any kind without somebody being hurt.

Mr. FITCH. Yes.

Commissioner WEINSTOCK. But the only question is, what is the greatest good to the greatest number, and that that should prevail.

Mr. FITCH. Yes.

Commissioner WEINSTOCK. One other point. You touched upon the fact in your statement that employers are voluntarily endeavoring to establish better conditions for their workers, with a view of binding them more closely to their enterprises—

Mr. FITCH. I beg pardon, I did not say they did it with a view to binding them more closely to their enterprises. I said the incidental effect of many of those things, whether intended by the employer or not, is in that direction.

Commissioner WEINSTOCK. Well, we must of course assume that these large business enterprises are conducted primarily for profit.

Mr. FITCH. Yes.

Commissioner WEINSTOCK. If there is any philanthropy or benevolence connected with it, that is merely incidental; and that the thought that animates action in large industrial enterprises is the best possible result, and if these welfare efforts have been made, the prime thought was better results and better profits. In fact, you will find, many will tell you they are doing this on business principles and that the thought of philanthropy and benevolence is only a mere incident with them. Very well. You have pointed out the danger of that from the standpoint of the worker, that it minimizes what otherwise might be energetic effort on his part to better his condition on his own initiative. If that is so, what would you advise? Would you advise that employers be discouraged from doing the things that you have touched upon and letting the burden rest entirely upon the worker to better his condition, or would you approve of the efforts of employers to continue, and encourage them, if you were a member of the commission, to do this sort of welfare work? It is important for us to have that point clear in our minds.

Mr. FITCH. That is a very large question which would involve a very long discussion to state all that even I have in mind in regard to it, although I do not claim to have gone deeply into the question. Certainly I would never do anything but encourage employers in improving the physical conditions of their plant, making it sanitary, introducing safety devices, and organizing their employees along safety lines as was suggested yesterday. I want to indorse that movement with all the strength of which I am capable. Anything that the employer might do to make the plant a healthy place and a safe place in which to work I would indorse and encourage in every way possible. That is sound business policy, and it is a part of the moral obligation of the employer, I think, to provide that sort of place in which to work.

Now, speaking of a pension plan, for example, and I mention that as one thing without going into the other things, a man who had something to do with the work, a great deal, perhaps one of the prime movers in working out one of the biggest pension plans in this country, told me last week that undoubtedly the effect of it was to curtail the work of the employee; that undoubtedly it was not sound public policy to permit a pension scheme of that kind to be introduced widely and to continue. He told me finally that he believed the only answer was Government insurance instead of private pension plans.

Nevertheless, we agreed, after talking it over, that the thing could be worked out even in advance of the Government taking it over by protecting the employee at every point in some such way as this: We will say he enters the employ of the company and is offered a pension system. Establish a legal right in some way, I can not say what would be necessary for that, but establish his legal right to the pension. It seems to me it would be necessary, and regardless of legal advice it seems to me it is very much better from the standpoint of society for the employee to contribute himself to his old-age pension fund, just as is done in Germany under the control of the State. Then suppose he does want to quit the employ of the company at the end of three or five years or any other period in advance of the time he would be naturally retired; let him have the right to a paid-up policy just as he would have if he stopped his payments on a life insurance policy, and he would have a paid-up policy at any time. And let that be done if a man quits his job, and let it

operate even if he goes on a strike, and let it be understood he has a paid-up right in that policy.

Commissioner WEINSTOCK. Am I to gather from what you say that you would favor a national pension system, a workmen's pension system something along the lines of the German system, as one of the remedies for this industrial unrest.

Mr. FITCH. I think that is the only answer, in the last analysis.

Commissioner WEINSTOCK. A national workmen's pension system?

Mr. FITCH. There are undoubtedly grave legal obstacles to making it a national system. I am speaking of what I would like to see rather than what I may conceive to be possible.

Commissioner WEINSTOCK. But dealing simply with the ideal?

Mr. FITCH. I think as an ideal that is the only final and complete answer. Whether we are ready for that is another question altogether.

Commissioner WEINSTOCK. Now assuming that this commission, for example, should find that that would be one of the remedies, not the only remedy, of course, but one of the remedies to minimize industrial unrest, and assuming further that it could be nationalized, do you figure that the contributory system, where the worker pays toward the fund, is to be preferred?

Mr. FITCH. As an old-age pension; yes.

Commissioner WEINSTOCK. You think the contributory system is the preferred system?

Mr. FITCH. Yes.

Commissioner WEINSTOCK. I was incidentally investigating that question while abroad some years ago, and I happened to be in London when the old-age pension system was before the British Parliament; and in a conference with John Burns I put this question to him: I said, "I notice that the English old-age pension system does not contemplate a contributory system as they have it in Germany, and why the differentiation?" His answer was: "We thoroughly investigated the German system, and we reached the conclusion that the cost of collecting the fees from the workers was almost prohibitory, and therefore only a fraction of their contributions would go into the fund, and the greater part of it would be eaten up by the cost of collection, and we therefore decided not to make it." What have your observations led you to conclude?

Mr. FITCH. As I say, I have not made a deep study of this Government plan, and on the other hand, I have an open mind on it, and any information as to that I would take into consideration and would hope the commission would consider it.

Commissioner WEINSTOCK. Then I take it you would recommend to the serious consideration of this commission that we look into the question of workmen's pensions as one of the possible things to minimize industrial unrest?

Mr. FITCH. Absolutely.

Commissioner O'CONNELL. Do you understand that the organizations of labor have decided by almost unanimous vote against the contributory part of any such law that might be enacted?

Mr. FITCH. As to an old-age pension?

Commissioner O'CONNELL. Yes.

Mr. FITCH. No; I did not know that.

Commissioner O'CONNELL. And workmen's benefits. etc.

Mr. FITCH. No; I did not know it.

Commissioner O'CONNELL. They are absolutely against any such idea. In speaking of the displacement of labor by machines, you mentioned the bottle-making men, for instance. That machine not only displaces the skilled men but it eliminates the unskilled men also. It simply makes the bottles automatically.

Mr. FITCH. Yes.

Commissioner O'CONNELL. You run the glass into the machine and it comes out bottles, and all that is required is some little girl or boy to go around and pour oil on the machine once in a while. Could not the skilled man who is being displaced by the machine enjoy some result of that machine's introduction into the business which eliminates practically his labor altogether?

Mr. FITCH. I think so.

Commissioner O'CONNELL. Ought not he at least to be the attendant upon the machine, where it shuts him out of work or reduces his skill? Should not the man be taken care of with the machine, as it were?

Mr. FITCH. If you have 10 men displaced by one machine and only one attendant is needed, you have a difficulty there.

Commissioner O'CONNELL. Well, at least one man should be taken care of?

Mr. FITCH. Yes.

Commissioner O'CONNELL. You will find at the present time that is not the case; so far as skill is concerned, the skill is lost sight of. What you say about the introducing of a machine reducing the amount of skill required, there is no question about that being true. But the cost of production per machine or per something that is produced, the total cost of that, for instance, the building of a locomotive, say it requires 1,000 men a given time to build a locomotive, and by the introduction of a machine 500 men build the locomotive in half the time, the cost has been reduced 100 per cent and the number of men has been reduced 100 per cent. Something should be done whereby that number of men should be taken care of in that production. They should enjoy some result of the reduced cost of that production. Do you get the idea?

Mr. FITCH. Yes. My proposal would not be, however, that each industry would take care of those displaced, because it would leave forever ups and downs throughout the entire industrial field, one industry being able to take care of its men while others not so well. So if it were worked out as a scheme of insurance and taking care of every man who was so displaced, by unemployment insurance, perhaps—I am not here to advocate all forms of insurance, as I am not an insurance expert—but to take care of the unemployed man and tide him over and help him secure a better job—those things would have to be done on a national, or at any rate a State, scale, rather than by industries.

Commissioner O'CONNELL. Your idea being that the State should take care of those insurances and pensions with a view of doing away with the bonus systems that, in your way of thinking, do in some way bind men or obligate them in some way which prevents them from asserting what they feel to be their right?

Mr. FITCH. I think the States could do it, but I do not think for a minute that the States will do it overnight, and I think it can be handled more simply than that in the meantime. I see no objection whatever to the employers in a given industry combining for the purpose of establishing funds that will take care of men under such circumstances, so that a man may freely go from one firm to another in the same industry and not lose his skill and benefits because he left the employ of Jones and went to the employ of Smith, but let Smith and Jones cooperate in the fund instead of Jones doing it alone and Smith not doing it.

Commissioner O'CONNELL. Do you suppose the tax should be general or upon the entire people employing these men?

Mr. FITCH. If it were a Government proposition, it should be a tax upon all systems, supposing it were on the basis of a tax. But what I did suggest was a contributory system, with the employer and the employee contributing and a certain balance by the Government, which, of course, would mean taxation of all citizens. But I think the form would have to be different with each form of insurance.

The CHAIRMAN. Mr. Fitch, might we ask you to make a little written outline of a proposed investigation into these subtleties which you have spoken of, or into those different things which you think operate to take away freedom in the industrial world and give it to Mr. Lauck?

Mr. FITCH. Yes; I would be very glad to.

The CHAIRMAN. I wanted to ask you one other question. From your experience can you suggest here briefly what the trades-unions have done or are doing to make the employment of trades-union men desirable economically?

Mr. FITCH. You mean to convince the employer?

The CHAIRMAN. No; to make it more desirable economically, using that term in its broadest sense.

Mr. FITCH. I think the trade agreement has had a very great deal to do in that direction in providing stability in an industry. I think the highly organized industries are not subject to the sudden and altogether unexpected interruptions such as took place in Paterson in the silk industry, where a very large proportion of the employees were unorganized and there was a sudden revolt, or such as took place in the Bethlehem Steel Works, where, there being no trade agreement and no understanding between the employer and the employee, there was a sudden upheaval which took place in the middle of the filling of contracts by the employer. The absence of contracts between the employer and the employee

and the existence of a contract at the same time between the employer and the consumer puts the employer in a condition of great jeopardy, and I think the trade agreement has removed that jeopardy in many industries.

Commissioner LENNON. How does it strike you as regards the fixing of a standard of uniform wage in an industry? How does that act upon the success of the business, to fix the labor cost for every manufacturing line at the same point, what tendency does that have?

Mr. FITCH. Undoubtedly that enables the employer to estimate his cost and to put in his bids with a certainty of knowledge as to what his costs would be that he would not have otherwise.

Commissioner LENNON. And knowing that the other fellow has to pay the same thing?

Mr. FITCH. Yes.

Commissioner WEINSTOCK. Do you refer, Mr. Lennon, to a minimum wage or a maximum wage?

Commissioner LENNON. Whatever the agreed wage may be.

Commissioner GARRETSON. Mr. Fitch, is not what you referred to as being described by the employer as loyalty being engendered by these various welfare devices, in reality liability on the part of the employee? Is not that what it guarantees?

Mr. FITCH. Usually, I should say; yes.

Commissioner GARRETSON. Do you hold that any system of pensions contains within it the principles of equity if its benefits are terminable at the will of the man or the corporation who grants it, arbitrarily?

Mr. FITCH. I think a system of that kind is inequitable, essentially.

Commissioner GARRETSON. Let us go back to that print shop a minute. Is it not a fact, and I assume that you are somewhat familiar with the conditions in the printing trade from what you have said, that the old stick space type-setter is relegated to the country office at the present time?

Mr. FITCH. Yes, sir.

Commissioner GARRETSON. And that only such men as have been able to master the use of the linotype or the monotype have been able to pursue the calling that they pursued prior to its introduction.

Mr. FITCH. Very true.

Commissioner GARRETSON. Has there been any reduction to the average consumer of the rates of printing therefrom?

Mr. FITCH. I am not in a position to say as to that. I am not familiar with that.

Commissioner GARRETSON. I wanted to discover that fact from a personal sense. I spend \$35,000 a year for printing, and I have never been able to find that reduction, and I wanted to know where it was. Do you suppose that out of the large number of men who have been displaced as printers by it, that there is any feeling of unrest, or that those men are readily reconcilable to the present industrial conditions?

Mr. FITCH. Without having made any inquiry, I should naturally assume that there would be a feeling of unrest.

Commissioner GARRETSON. It would be rather hard for them to treat the public good, then?

Mr. FITCH. Yes.

Commissioner GARRETSON. I judged that is the case. I would like to ask one other question: Who is the public?

Mr. FITCH. I trust that all of us are.

Commissioner GARRETSON. Now, I am asking that question on this basis: What portion of the public do laboring men constitute?

Mr. FITCH. Do you mean—

Commissioner GARRETSON. When we talk about the public, what proportion of it is composed of individuals who are subject to those labor conditions?

Mr. FITCH. Oh, a very large proportion; I could not say.

Commissioner GARRETSON. A very large majority, is it not?

Mr. FITCH. A very large majority; yes.

Commissioner O'CONNELL. The much-abused public is the minority.

Mr. FITCH. I might say as to the possibility of a man losing his rights, I heard the other day of a man drawing a salary of \$5,000 in a company which has a pension system, being discharged in about the seventeenth year of his time of employment with that company, and making way for a younger man who started to work at \$2,000.

Commissioner GARRETSON. Let me ask one question right there as to pensions, as you have spoken of that. Do you consider any system of pension device by a single corporation without any connection or affiliation with any other pension system, contains within it anything but the elements necessary to coerce the men who are receiving it, if it is terminable when the man's connection with that corporation or employer ceases, or should it stand as a vested right acquired by him, regardless of the period, in the degree that it has accumulated to him in that service?

Mr. FITCH. Oh, yes; it should stand as a vested right of the employee; that is my whole point.

Commissioner GARRETSON. Take the whole system as devised, and we will give them full credit, philanthropic employers; my friend did not claim for them philanthropy, but business; but take it on the basis of philanthropy, employers from that standpoint, do you believe that the whole welfare system as it is at present paternally administered, is taken up by them as anything else than the lesser of two evils; to defeat, in other words, activity on the part of their employees in a direction that they could not control?

Mr. FITCH. I should rather not go into the question of motives, because I think they are so varied and complex. It is a good deal easier to say what is the result.

Commissioner GARRETSON. Well, express your opinion as to the result, then.

Mr. FITCH. That is what I tried to do. The result is to prevent activity on the part of the employee.

The CHAIRMAN. There are a couple of questions which the commission would like to have answered, and I will hand them to Mr. Lauck so he can put them in the record directly.

Commissioner DELANO. I would suggest that as all of the commission may have questions to ask, that it would be very desirable if they could be transmitted to the chairman and embodied in a list of questions by our experts which the witness or expert who is testifying will be permitted to answer thoroughly and carefully.

Commissioner LENNON. At some other time besides at the hearing?

Commissioner DELANO. Yes. I think if we do not adopt that practice, that we will get into a wrangle where we will not accomplish anything.

The CHAIRMAN. In justice to the speaker he should not be called upon offhand to answer some of these complex questions.

Commissioner BALLARD. I think the time when the thing is up for hearing is the time to thrash it out.

Commissioner O'CONNELL. Do you mean we are not to address the gentleman who is speaking as to any questions which may arise?

Commissioner DELANO. I think Mr. Garretson's questions have been pretty fully covered by the witness, and we can spend a great deal of time unnecessarily in thrashing these things out.

Commissioner O'CONNELL. I do not think it would be fair, if some gentleman addressed this commission and made statements which some of the commission knew to be incorrect, making them perfectly innocently, I think it would be well to bring that fact out so that the witness may have the opportunity to straighten out his mistake.

Commissioner WEINSTOCK. Speaking for myself only, I am here to be educated. These are all very great and complex problems that not any of us are in a position to handle intelligently at the present time, and one of the great advantages in having these ladies and gentlemen come before us, who are experts and who have given their lives to the study of these subjects, is to educate us. And the only way I can get educated is by asking questions and getting answers. If we reduce it to cold type at a later period, that will not answer questions that might suggest themselves to us, and I do not know of any better way than by taking advantage of the opportunity to become educated from a man who has given time and study to these problems.

Commissioner GARRETSON. Mr. Chairman, I want to draw attention to this phase of it. The gentlemen who appear before this commission make certain expressions of opinion. If my friend on the other side of the table who disagrees with some of my conclusions wants to ask a question to bring out in concrete form the implied opinion that came before, I shall not object to it, simply because I disagree with the idea he attempts to bring out. But if an expert on a given line appears before this commission recommending to this commission a course of investigation to be pursued, it is my intention to develop as clearly as I can, what his beliefs are; because if he is recommending a course

of action to the commission it is the right of the commission to know in as definite a form as they can get it, what it is that he desires to rectify, and upon what grounds it is safe.

Commissioner COMMONS. Mr. Chairman, would it be satisfactory if we reserve this discussion to an executive session?

The CHAIRMAN. I think so.

Commissioner COMMONS. My idea would be that the gentlemen should ask such questions as they choose until the commission has settled its policy as to conducting the investigations, and we should allow it to go on in this fashion and reserve for executive session the discussion of any questions of policy regarding how we should conduct these hearings.

The CHAIRMAN. Yes. Mr. Leiserson, would you be kind enough now to submit your suggestions?

STATEMENT OF MR. WILLIAM M. LEISERSON.

Mr. LEISERSON. Mr. Chairman and members of the commission—

Commissioner COMMONS. I suggest that the gentleman be asked to put in the record what his position is.

The CHAIRMAN. What is your present work?

Mr. LEISERSON. I am a deputy of the Industrial Commission of Wisconsin, in charge of their employment department; that is, on that part of the work of the industrial commission that relates to unemployment and employment offices comes under my jurisdiction.

The CHAIRMAN. What is your particular specific duty with reference to it? Are you the head of the free employment bureau of the State of Wisconsin?

Mr. LEISERSON. Yes; I am at the head of the work of the free State employment offices and am the inspector of private agencies and have the regulation of private employment offices.

The subject that I want to direct your attention to is unemployment. When you come to that subject, you are getting at the really fundamental thing in industrial relations; the things that Mr. Quick spoke about and the things that the Safety Council spoke about are all incidental. The bottom of everything is unemployment. It is unemployment or the fear of unemployment that keeps us from regulating trusts, from changing our currency system, and from reducing our tariffs; it is the fear of the unemployed men that keeps the trade-unions from organizing; it is the fear of losing a job that keeps a man from voting as he wants to vote; it is the fear of losing a job that jeopardizes a man's rights. It is the unemployment problem, I think, that is basic in everything.

Now, the unemployment problem has two sides to it. It is basic in the sense that the man is out of a job and is in fear of losing his job, and therefore is willing to give up all his rights, or he can not protect his rights; but on the other side the unemployment problem shows itself on the inside that the man refuses to work. That is, the man who is compelled every winter to spend his winter in Chicago in the lodging houses with nothing to eat except what he can get from the free-lunch counter, when he does get a chance to work in the summer, and when there is a great demand for labor, then he has acquired habits of idleness and he refuses to work at that time, and you have the unemployment of the winter balanced by unemployment of the summer, that is voluntary on the part of these same people, so that it is a problem both to the employer and to the employee.

Now, I want to direct your attention to the question of the fundamental causes of unemployment. As I see, what your commission wants to get at—it wants from us who come before you some definite suggestions as to what you might do on the various subjects that we are interested in. I should like to begin by telling you what not to do, and the reason that I can stand before you and tell you that is because I have done some of the things that ought not to be done.

In studying unemployment, you might get at the fundamental problem, you might say that seasonal fluctuations of industry are one of the causes of unemployment, and that cyclical fluctuations; that is, fluctuations over years, introduction of machinery, and so on, are fundamental causes of unemployment. Then you develop remedies for those fundamental causes, employment offices, unemployment insurance, public works for the unemployed, industrial training, and any one of the remedies of that kind. Now, any study that you might make into the question of unemployment will result in an analysis of

the question that has already been made. Books have been written on the question to which you could add very little, as to explaining the fundamental causes of unemployment, and the remedies that you could suggest to the United States Congress would be remedies that have already been suggested by other bodies in this country and by other bodies in Europe. They would be, as I mentioned, unemployment insurance, public work for the unemployed, employment offices, and so forth. You recommend fundamental remedies, but you have to take into consideration whether you can get those fundamental remedies across. If unemployment insurance and public work for the unemployed and other fundamental remedies of that kind mean taking money out of the pockets of taxpayers in the form of taxation or out of the pockets of employers in the form of making them contribute to insurance funds, and so on, you will not be able to get that across unless the employers and the public are educated to the point of doing that.

Now, at the present time, from my knowledge of the question of unemployment, if I were to confine it only to the States of New York and Wisconsin, where I have had experience, I should say it would be absolutely impossible to get an unemployment insurance law adopted in either of those States, and I think it would be impossible to get the Federal Government to do anything along that line. And you might suggest it and your experience would be what the New York Commission on Unemployment had. I was connected with that commission, and we made a thorough study of the question and went to Europe and made a very voluminous report, and it was a very good report, as good as could be made, and I know it because I wrote it myself. But the result of it was that it was filed away and not a single thing was done.

I want to direct your attention to accomplishing a thing that is fundamental, too, in a way. It is fundamental because you can get something done right now. When I became connected with the Industrial Commission of Wisconsin and we wanted to take up the same question of unemployment, instead of making a general study of the question and having to report, we took the benefit of those reports before and a bill was passed by the legislature which is a part of the industrial-commission law, which I should like to read to you. It is just a short statement, and it gives practically the fundamental remedies that you might have for unemployment:

“Powers of the industrial commission.” That is one part of the industrial-commission law.

“To establish and conduct free employment agencies, to license and supervise the work of private employment offices, to do all in its power to bring together employers seeking employees and working people seeking employment, to make known the opportunities for self-employment in the State, to aid in inducing minors to undertake promising skilled employment, to provide industrial or agricultural training for vagrants and other persons unsuited for ordinary employments, and to encourage wage earners to insure themselves against distress from unemployment. It shall investigate the extent and causes of unemployment in the State of Wisconsin and the remedies therefore in this and other countries and it shall devise and adopt the most efficient means within its power to avoid unemployment, to provide employment, and to prevent distress from involuntary idleness.”

Now, could you do anything better than get a bill like that passed now? You might get it passed. It takes in all the things, but the question is, Can you get anything done? Just to put the law in the statute books will not do you any good. So I come to the way something might be done, and I will give you my own experience that I can talk about with knowledge and from that I think you can draw some kind of a conclusion as to what you might do.

We found in the State of Wisconsin that there were agencies that were dealing with unemployment. We had public employment offices in the State—we had four of them—and we had something like 30 private employment agencies. There was something to begin on. Every study of unemployment that has ever been made that I know anything about has reported that the first step in the problem in dealing with unemployment must be the establishment of a system of employment offices to bring together the jobs that are open now to give the unemployed all the employment there is. We do not know now, although there are unemployed people in one part of the country or in the State, that there are plenty of jobs in another part of the country or another part of the city that might use those men, and the first step must be to bring them together. Now, you have provided a public agency whose business it is to do that. We have in the State of Wisconsin four of those. The first thing the industrial

commission ordered was a study of those four agencies; what are they doing? Well, we found that those four were not doing anything really to help the situation. The people in charge of them did not know the employment business. When a man was in it long enough to learn the employment business there was a change in the administration of the State and a Democrat or a Republican was substituted for him just about the time he got the business learned and somebody else took the job. Then these people—

Commissioner O'CONNELL. To the victor belongs the spoils.

Mr. LEISERSON. Then, these people, not knowing the business, have not worked out policies to deal with the problem they have to deal with. A public employment office, in the minds of many people, gives away work. Now, there is the danger. I have not much use for the argument about pauperizing people, but however much you may not place stock in that argument, that public activity or work pauperizes people, there is a danger there, and when an employment office is run on the idea that it is giving people jobs and makes them feel that any time they want a job they should go to the employment office, there is a danger of pauperizing people, and I have seen it, and the people, not knowing how to handle the employment office, did not know how to handle the people in order to avoid that difficulty and other things. About 30 to 35 per cent of the demand for labor in a city the size of Milwaukee, which is about 350,000, is for short jobs—casual labor. Now, there is a very great danger of an employment office instead of minimizing the problem of casual labor intensifying it by taking young people who might do steady work and showing them that they can get a short job for three or four hours and make a dollar or a dollar and a half during the day, and they get accustomed to doing that, and you are making the employment office a place for manufacturing casual labor. And in some States that has actually happened. And I might go through other things of that kind that happened in the employment office.

Now, when you get to the private agency they do not even try to handle the problem from the social point of view. The public agencies are supposed, at least, to help in the solution of the problems of unemployment. The private agencies do not even try it. What they are after is the profit from the business, just the same as any manufacturer or employer goes into the business of manufacturing or distributing goods. Now, the private agent intensified the evil in this way, and I might illustrate with a few cases.

Just at the present time everybody knows there is a large number of unemployed people in Chicago. At a conference that I attended in Chicago a few weeks ago the fact came out that just at this time an employer in Chicago orders 50 Polish laborers from Detroit to be shipped to Chicago. That shows one of the evils that the private employment agencies accomplish or bring about by merely looking for the profit that they can get in placing an individual. That is the theory, that if you leave to private individuals and to private enterprise the business of distributing labor in the country it works out not to distribute them properly is to congest laborers, as in this case in Chicago.

Another thing: At the present time private agents have not got very much business. If you go along South Canal Street in Chicago you will find signs up in some of the employment offices, "No shipments." They have not got any business. Now, an enterprising private employment agent knows how to get business, and one of them told me how he does it. He says, "When I have very little work and I have many laborers, I go to a manufacturer and tell him, 'Now, you are paying 20 cents an hour, and there are thousands of laborers coming to my office now, and I can get you 100 or 200 or 500 who will work for you for 17½ cents or 15 cents an hour, and I will supply them to you, and you will make a saving, and I will get \$1 or \$2 or \$3 from each of the men.'" That is another way in which the theory of leaving to private enterprise the distribution of labor works out to the disadvantage of the laboring man and to the creating of industrial unrest, as you may call it.

To come to the more concrete suggestion as to what your commission might do in this problem I think you might follow the example which the Industrial Commission of Wisconsin followed in its study. There are in the United States about 70 free public employment offices. Very few people know about them. There are very many private employment agencies. Everybody is agreed, at least theoretically, because it has taken the form of State legislation, that the public, the State, ought to do something in distributing labor. You can get something done on this first step in dealing with unemployment. You would not have the difficulty that you might have in trying to get a scheme of unemployment insurance across. Now, if instead of making an investigation of

unemployment in general and then recommending that the first step must be public employment offices and then leaving it there, and then perhaps some States will go on and create some more of the same public employment offices that we have now, which do not accomplish anything—if instead of doing that you made a study of the agencies that are now in existence for distributing labor, taking care of that first step, and then recommending to Congress a scheme for an efficient distribution of labor in the country and backing that up by showing how inefficiently the present method works, then I think you can get something done immediately. That may look like dealing with palliatives that are not getting at the fundamental thing. I contend that it is the most important and the only practical way in getting at fundamentals, and I will give you an example that we have in the city of Milwaukee.

In the city of Milwaukee now we have the same unemployment problem that exists throughout the country, whereas in other cities they are now talking about employment offices as a remedy for unemployment—and, by the way, in Chicago they have three public employment offices, and they have a mayor's commission on unemployment; and this mayor's commission on unemployment, as I am informed, has just recommended the establishment of another free employment office—

Mrs. ROBINS. That is right.

Mr. LEISELSON. Now, if those three could not do anything, what is the use of putting another one in there? We want to find out what the trouble is. In the city of Milwaukee we do not talk employment offices any more. We have got it, and the thing we are talking now is the regulation of the labor market by means of public work. Everybody in Milwaukee knows if there is any work in the city it is registered at the employment office, and the people in charge of the employment office have issued an appeal to the public to do work that they ordinarily leave to the spring now. They have issued an appeal to the people to do repair work and such things as they ordinarily leave for the spring now. And the most important thing they have done is to appoint a committee to go to every department of the city and find out if those departments could not to a large extent do most of their work in the winter, when other people are throwing workmen out of work. Now, the answer we get is that we can not do it, our appropriations are not arranged that way. In other words, the people who have this work to do are on the defensive; they have to show why they can not get the public work done now. And the reason they have to show it is because we have already thrown this problem onto the community through the employment offices.

There is one point I want to bring out as to the kind of study that you might make as to why these offices are not accomplishing what they ought to accomplish. We have had employment offices in this country since 1890. Ohio started first. During all that time there has not been worked out anything like a set of administrative principles of technique or science of running an employment office. Nobody has thought of working that out. Nobody has thought of learning the employment agency business. In any private business that is the first thing a man has to do; to succeed, he has to learn the business. Now, what are the things which make an employment business successful? If you make a study of this question, that is the most important contribution you can make. If you can recommend to the Congress of the United States a system of public-employment offices, State and Federal, working together, if you can recommend in that system what the administrative principle shall be to control the management of those offices, then, I think, you will have taken the most important step that you could possibly take at this time to remedy the problem of unemployment, and you will actually make a beginning on it. For I really feel that the people of the United States are ready to do this thing.

What are the things that make for a successful employment office? I think the most important thing is the selection of the force, the people who are going to do it. You know the way we have had legislation in this country, studies have been made on the fundamental principles, just as it has been suggested you should do, and then as the result of the fundamental principles you agitate and get up a lot of publicity, and you pass a law; and then all those people who know anything about the law, and the reasons why it was passed, forget about it and think the question is solved and say we have passed a law which will remedy this situation.

And it is just at that point that you ought to begin. In other words you are doing what the novelists and dramatists do. They end a story at the time

the hero and heroine get married. It is just there that the story ought to begin. Every one of these reforms that have been worked out in the form of legislation—that is rather a wild statement; I mean with regard to unemployment it is absolutely so—every reform with regard to unemployment, take the employment officers, the law has been passed, and then it has been left to political appointments, to people who knew nothing about the business or about the reason for establishing the offices to administer those offices. And of course they could not be successful. Therefore I suggest that you first work out the kind of a system or have your investigations directed toward the kind of system that will make for getting the best people that know how to run the offices actually there. That means some form of civil service, some form of permanent tenure in office. That is the most important thing. I might, by way of suggestion, tell you how it has been worked out in Wisconsin. I will do that presently.

Another thing is when you get a public-employment office, laboring men are afraid it will be used as a strike breaking agency to lower wages. Employers are afraid it will be used to fill their shops with union men. That has been one of the most fundamental causes for the failure of employment offices. Laboring men have tried to get trade-union men in charge of the offices. When they have done that what has happened? They have refused to call for any help at all, except the most casual kind of work. On the other side, where the employers have got their man in the laboring men have looked with suspicion upon the office.

Now, the scheme we have worked out in the city of Milwaukee is this: That the question of getting the job is the question which must be left outside of the struggle between capital and labor, and that absolute impartiality must be the principle which guides the employment office. How have we done it? We have taken five members of the Civic Federation of Labor in Milwaukee and have taken five members of the Merchants & Manufacturers' Association, and we have appointed them a citizens' committee on unemployment, and they practically run the office. They see that absolute impartiality reigns in that office.

Commissioner O'CONNELL. It takes those 10 men to do the work of 1?

Mr. LEISELSON. No; they do not work.

Commissioner O'CONNELL. They watch the one?

Mr. LEISELSON. We have 5 men who are employed in the office and they help direct those 5. The committee has also members of the city council on it, but these men are sort of a board of directors; they are what are called in Europe the advisory committee of the employment office. There is no place in the country, I think, where the class conflict is keener than in Milwaukee. Over there they do not argue any more at all about public ownership or things of that kind; the question over there is this: "Shall the government be taken from the city hall and be put in Brisbane Hall, where the trade-unions meet, or in the Germania Building, where the Merchants & Manufacturers meet?" That is the question over there. Now, if you can get under circumstances of that kind, under the keenest class conflict, both sides to agree and work on a proposition of this kind, I think that is evidence enough that that is a practical idea.

Now, I will illustrate that a little further by showing you how practical it is. The industrial commission, which has charge of these offices, did not have money enough to run them. The same thing is true all over the country, there is not enough money appropriated for the work. So the industrial commission went to the city council and county board and said, "You are interested in this and you contribute something," and they pay; altogether they have contributed \$5,000 for the work. When it was first done the Socialists were in control both of the city and county. Everything that the Socialists did, the good things and the bad things, because it was done by the Socialists, was turned out—the child-welfare work, the tuberculosis work, and practically everything, even Prof. Commons was turned out, because he happens to be with the Socialists. But when it came to the appropriation for the free employment office in Milwaukee we had Mr. Van Schaick, the secretary of the International Harvester Co., who is the chief lobbyist in the legislature for the Merchants & Manufacturers, go together with Billy Coleman, a Socialist painter, the assistant business agent of the trades council, and together they went before the finance committees of the city council and the county board and said, "We want this." Now, no politician will refuse to give anything to a combination of that kind. So we have had no trouble in getting the appropriation that was necessary for that work.

Now, here I come to the question of choosing the board. We went to the State civil-service commission, which has charge of choosing the people, and we said, "We want to get the best men that know this business, and we have got a committee in Milwaukee which is made up of employers and workmen, who watch and see that the business is properly and impartially done. We want you to let this committee have something to do with choosing this force." They were perfectly willing to do it. So a system of civil-service examination has been worked out something along this line. The chief examiner of the State civil-service commission is there and I represent the industrial commission, and we have two members of the trades council and two members of the manufacturers, and we are the examining board practically, the civil-service board, for picking the help for that office. The way it is done is this. There is a minimum requirement with regard to a written examination, to see that the man has the minimum amount of education, but that only counts three points out of ten. The seven points, the main thing is that every candidate comes before this examining committee, and the first thing we do, after we interview the man, when he goes out we decide can we use him or not; and if we can not use him, he fails, no matter how he comes out in the written examination. And after discussing the men we grade them, one, two, three, and in every case we have graded them that way, with perhaps two or three exceptions, and the civil-service commission has practically acceded to our request that the men be graded that way; and even when a man was graded one, two, three, and this committee decided that the first man is not the man and the third man is not the man but the fourth or fifth man is the man, we have got the fourth or fifth man, because the civil-service commission was convinced that we were anxious to get the right man. There was not any political party there, because all the interests were represented in the choosing of the men.

There are two principles I have already illustrated, civil service and representation of the interests involved, and the impartiality secured by this kind of a committee. Now, the third thing is that an employment office is not a charity proposition. You have to get that out of the people's heads. A lot of people still think if a man is out of work for any reason whatsoever if you take him to the employment office he will get a job. If a man can not hold a job, if he is too old or inefficient or can not talk English, it does not do any good to send him to a job, because he can not help it. The fundamental thing is to make of the employment office a business proposition and fit the man to the job. You have to do that first, and when you establish the employment office on a business proposition you get the employers coming to that office, because they know they can get the best men they want for the business. Then, after you have established your reputation for that, then, when a deaf and dumb man comes into the office, or a blind man, or a crippled man, you can call up the superintendent whom you know has confidence in you and you can tell him, "I have a handicapped man here; can't you find a place for him?" And in that way you can do the work of getting the handicapped man employment. But the essential principle must be that it is a business proposition. Every big employer of labor knows that he has to have an employment agent in his establishment. Now, just the same as every employer knows he has to have that, for the whole city there ought to be an employment agent to take care of all the work. The reason an employer has an employment agent; for instance the Allis-Chalmers Co., or the International Harvester Co., have an employment department, is this: Here is a department that lays off men; when those are laid off they ought not to leave the establishment, they ought to go into another department in the establishment, and they are sent immediately to the employment department to find that out. This same principle should govern in a city. If a man leaves the Allis-Chalmers Co. and there is work at the International Harvester Co. he ought to be sent to the employment office and sent there to get that work.

Another thing, a man may be a first-class worker, but he would not know the first thing about getting a job; just the same as a manufacturer may be a first-class manufacturer but he might be a very poor merchant. A laborer has two things to do: He has to work and know how to sell his work, and most of them do not know how to sell their work. On the other hand the small employer may be a very good manufacturer, but he does not know the first thing about hiring men, he does not know how to size them up and how to get the right man for the place. The assumption most of us have is that the private employer, unlike the Government, picks out the best men. As a matter

of fact he makes the most foolhardy picks, and the idea of the employment offices is to develop a set of specialists as employment agents, who can sift the men and who know only the employment business and who can pick out the man for the job. That is the third thing, the employment office, a business proposition, to fit the man to the job.

Now, the fourth proposition, which is absolutely essential in this, is to distribute information and not jobs. If you give a man work, if a man gets the feeling that he comes here and can get work, then there is a tendency to pauperize him. If a man comes up to the counter in one of our employment offices and he says, "I have been here three months and can not get a job yet," we tell him "You must be no good, if you can not get a job in three months. We have had jobs up every day on the board, and if you can not get them, there must be something the matter with you." We hand out information where there are jobs. We never give a man a job but tell him where there is a job of the kind that he can do. That is an essential principle that must prevail in an employment office.

Now, to come to a concrete suggestion, there has just been organized an American Association of Public Employment Offices. This association was started by the mid-Western States with several purposes in view. The most important one was to have uniform methods of doing business. You would be surprised at the number of methods that prevailed in these 70 different employment offices in the country. There are probably 65 different methods. Some keep records and some do not, and so on. The idea here was to learn from each other, if one employment office got a new idea as to how to handle a certain kind of labor, the other offices ought to know that immediately. And another thing, in order to compare the work, in order to get cooperation, you have to have uniform methods. Now, when you speak of uniform methods of bookkeeping, say in an employment office, the ordinary reaction of the person to that, is, well the business of an employment office is to get a man a job; you do not want any bookkeeping methods in there. That is what has happened in practically all our offices. We have had very few records kept. Just as it is important in any business to have a bookkeeper to know where you are at, it is important to have bookkeeping of the very best kind in an employment office. You do not deal in dollars and cents, you deal in man and jobs; but you have to have a bookkeeping system in order to know where you are coming out, and also to know whether you are getting the right man into the right place.

One object of this association is to have all the employment offices adopt a uniform method of keeping accounts. Another is to improve the efficiency of the office in the sense of handling different classes of labor. Another is to get the transfer of information between offices; another is to transfer laborers themselves between the States. This association has an executive committee, made up of one man representing the employment offices in each State. We have nine States represented and three Canadian Provinces. This last convention decided to have an investigation made of all the different methods used in running employment offices in other countries and in this country and of the policies of administration which prevail and to recommend at the next convention some uniform system for discussion and approval by all the offices.

Now what we are doing with this association is what the Federal Government ought to do. It is because the Federal Government has not done it that we have organized this voluntary association. The State governments even will not do it, and to show the need for it and the earnestness with which the people have gone into it I might tell you that the people who have organized the association, although public employees, to pay the expense of the thing, had to go down into their own pockets to make it go. That is a thing that the Federal Government ought to do.

My concrete suggestion to your commission would be not to study the general problem of unemployment. If you want to make a report on it, get Mr. W. H. Beveridge's book or get my report, and that will be as good as you can get, and then put a man or two men or whatever you have to make this kind of a study which we are making of the uniform methods in the office and how the Federal Government can cooperate with them for the distribution of labor, and taking the first step in dealing with unemployment, bringing the man and the job that is open together and when you have done that, then you will be throwing onto the community the next problem, and the next commission that follows you can take that up.

Commissioner O'CONNELL. What do you do with the farm hands?

Mr. LEISELSON. I am glad you asked that question. At the present time we do not specialize with the farm hand—that is, we have not got one man who does no other business except with farm hands; but we do attempt to get the farmer help. One reason that the farmer can not get help, aside from the fundamental causes which Mr. Quick spoke of, and those causes are fundamental and those are things which can not be remedied by an employment office; do not mistake me on that point; but what Mr. Quick said in regard to the floating labor on the farm is true, not only of the farm hand, but it is true also of the railroad laborer and the lumber jack and the ice laborer and the construction worker, and even in the factories you are approximating this hobo migrating type of wage earner.

I think that is one of the most important things that reveals itself in our industrial life at the present time, not that you have these flare-ups that make strikes, but that you have a mass of five or six or ten million men who are not working steadily and who are hopeless, roving men, going from place to place. And if I may be allowed by way of digression to suggest something, the reason these laborers migrate is because they have not got any incentive to work. The thing that you hurled against the Socialists was that under socialism there would be no incentive to work. That very thing is happening right now. For a large mass of common laborers there is absolutely no incentive to work. They work a month and then they get back to the city to spend the money, and you ask them, "Why didn't you stay on the job?" And they will reply, "I could not stand it." It was not in them. There was not any reason why they should do that. Now what is happening to those fellows? They have not any incentive. What does that mean? It means what we are so often afraid of with regard to capital. Suppose you have stringent legislation in the way of insurance, you put burdens on capital, and it is timid and will be driven away, it will not stay there, it will go out of the country. That is exactly what is happening to your labor, it is getting timid, there is not enough protection, there is not enough return on their labor for them to invest their labor; so the laborer refuses to invest and moves on and keeps moving on. Employment offices will not remedy that situation.

Commissioner WEINSTOCK. Is not the fear of hunger in itself a sufficient incentive for him to work?

Mr. LEISELSON. Yes; but only until he can get his stomach full and then he will stop.

Commissioner O'CONNELL. You believe then that the solution of the whole proposition is the proper organization of employment offices?

Mr. LEISELSON. No; I was just saying I do not believe the employment office can solve the proposition. The reason I do not want you to go into solving that is because, supposing you did find a reason for this thing—

Commissioner WEINSTOCK. What thing?

Mr. LEISELSON. That the laborer refuses to invest; I think the basic problem is that the laborer at one time refuses to work and at another time can not work.

Commissioner O'CONNELL. I am speaking now of the opportunity to work. Do you know whether he wants to or does not want to? Say he wants a job, what is your remedy for that? I want a job now and want it bad, what is the way to remedy that?

Mr. LEISELSON. The way to remedy the unemployment problem, in my opinion, would be the way capital gets a return on its property that is unemployed. In other words, it gets profit when it is not at work. An electric-light plant is not working now to fill those lights, but the plant must be ready at any time to meet the demand, and the theory of the courts is that you have got to give the owner of that electric-light plant a profit not only on the property which is actually being used now but you have got to give it a profit on that capital which is idle. And the same way you can get that in the public service, your fireman and policeman—the fireman who is waiting for a fire to occur is not unemployed; he is waiting and ready to go to work, and you do not consider him unemployed. You pay him in all other industry. You consider the man who is waiting to go to work as unemployed. You are organized like the volunteer fire department; that is the way you treat the unemployment problem; that he is only working when he is actually doing the job by the hour or by the day.

Commissioner O'CONNELL. How are we going to get him work?

Mr. LEISELSON. If you want to know how to remedy that proposition, I may state that, for example, all the industries in the country ought to be owned

by the Government, and everybody ought to get a month's vacation the way I do. I have a month's vacation and I am unemployed and do not worry about it at all—

Commissioner O'CONNELL. I do not agree with you on that proposition.

Mr. LEISERSON. Just a moment. That is the fundamental remedy in my opinion. If you recommended that, where would you get? You would get nowhere.

Commissioner DELANO. We would get it in the neck.

Mr. LEISERSON. Yes; that is why I say you have got to get down to the practical proposition of what you can do now, and public employment offices are a step in the direction of accomplishing the thing that I stand for or the thing that you stand for. Under any system of government or any system of industrial society or organization, you will have to have agencies for distributing labor; and so I say do this thing now, because it is the most important thing that you can do now.

Commissioner O'CONNELL. Would there not be another side; if agencies are successful in the distribution of labor from the employees' standpoint, how about an agency to distribute the jobs from the employers' standpoint?

Mr. LEISERSON. It is the same thing.

Commissioner O'CONNELL. Why should it not work both ways?

Mr. LEISERSON. Distributing labor is not perhaps the best term, but it is the term that is generally used. What I would rather say would be concentrating labor and demand, demand and supply, in one place, making a labor exchange.

Commissioner WEINSTOCK. A clearing house?

Mr. LEISERSON. That is the most important part of it. It is not only distributing labor.

Commissioner LENNON. You believe this problem of the unemployed is one of the great problems, if not the greatest problem?

Mr. LEISERSON. Yes.

Commissioner LENNON. And you suggest this as a step in the evolutionary process, to finally get rid of that problem?

Mr. LEISERSON. Yes.

Commissioner LENNON. Do these public agencies charge a fee to the laborer?

Mr. LEISERSON. Not now. There was one in Los Angeles that did. That is a thing which should be investigated. Some people believe a fee should be charged in order to keep the tramps out. My experience is that it is a mistake. If you have the right people to run the office, who can maintain discipline in the office, you do not need it, and, on the other hand, the fee works a hardship. Sometimes if you are only making the fee pay what the service is worth, you will keep the man from getting the job. We have many cases where the man has absolutely nothing. As a matter of fact, a man does not go to work as long as he has 15 cents in his pocket.

Commissioner WEINSTOCK. Another thing, in the State of Wisconsin are these public agencies municipal or State?

Mr. LEISERSON. We have a law by which the industrial commission administers them. We think it is essential to have a State system. In fact, a national system would be better, but next to the national we have a State system, and we have a law now by which any municipality or village or county may enter into an agreement with the industrial commission of Wisconsin jointly to maintain an employment office.

Commissioner WEINSTOCK. In other words, the State subsidizes the locality?

Mr. LEISERSON. No; the way it is usually done, the locality furnishes the quarters and telephone service and all those expenses, and the State pays the salaries and the administrative expenses.

Commissioner WEINSTOCK. Then you have to have State legislation to begin with?

Mr. LEISERSON. Yes; I think State legislation is essential.

Commissioner WEINSTOCK. Of course, you can furnish copies of your bills that have been passed?

Mr. LEISERSON. Yes; and I have a number of things here. I do not know how far you want to go with it.

Commissioner LENNON. Would you be willing to give just the gist of what you have presented in writing, and send it to our expert?

Mr. LEISERSON. I have put an outline before your commission.

Commissioner LENNON. I have not seen it.

Mr. LEISERSON. One point I had not brought out, and that was the distribution of farm laborers. You will not solve the problems Mr. Quick has spoken of by employment agencies, but here is the point with regard to getting farm

hands on farms. Railroad camps and lumber camps are farther away from civilization than farms are.

The conditions of employment in railroad camps and lumber camps are worse than on the farms, and yet ordinarily the railroad company and the lumber company have all the help they want. That is, they can not keep them steadily, but they have one gang coming and one working and another going, and they always have one working anyway. Now, why can they get it, and why can not the farmer get it? It is merely a question of organization. The lumber company when it wants men comes to our employment office in Milwaukee or writes to us there, and we tell them the best way is to send a man down and sit here a day and you can get 50 or 100 men, pick them out yourself. If you can not send a man down, telegraph transportation to the office and we will pick out the men and see that every man has enough baggage to pay for the cost of transportation, and we will send a man down to check the baggage and send you the checks, so you will be sure you get the man there, and then you are able to get the help. Now, railroad companies and lumber companies are able, through employment offices, to secure labor. Some of them run their own, sometimes railroad companies run their own employment agencies, and sometimes make contracts with private agencies to supply them with labor, and these men know when they want a job, they go to Chicago, Duluth, Detroit, or Milwaukee, where the labor market is, and they are shipped out. If the farmer could go in the same way and get his men from an employment office, he could get the same laborers and same kind of men to go out on the farms.

Now, this letter which Mr. Quick read from Mr. Taylor about an agricultural employment bureau, the idea of that would be to have county agricultural agents and then have division men from the college of agriculture at different parts of the State and have them gather together the demands for farm hands in the same way that the lumber company does, and then send it to the employment office and have the men sent to the farms in great gangs, just the same as they do to the railroad camps. For example, if the farmers in one town get together and say they need 100 men, and if they send an agent down to the city of Milwaukee and he spends two or three days there he could pick up 100 farm hands and take them all back if he would advance the transportation for them. You asked the question about transportation. I have some data on the question which might be interesting. Most of the shipping we do from the Milwaukee office is done by an arrangement with the railroad companies, so that we get the transportation directly, and that is we just go down and tell them we are from the employment office, and they have an order from the firm to give us all the transportation we want, and we check the baggage. That part I do not count, but the money actually handled by our force during the year ending November 1, 1913, was \$920, close to \$1,000 actually handled, and money turned over to our superintendent at Milwaukee by employers who advanced transportation.

Now, in a comparatively small city like Milwaukee that is quite a lot of money, especially if you count in that we send about four or five times as many men on transportation that is advanced directly to the railroad company as the amount of money we actually handle.

Commissioner GARRETSON. Your idea would be the extension of what we might refer to as the Wisconsin idea over the union, so that Georgia and Montana might bear the same relation to each other that Oshkosh and Ashland do.

Mr. LEISERSON. That is quite correct.

Commissioner WEINSTOCK. What, if anything, has Wisconsin done along the line of furnishing farm labor?

Mr. LEISERSON. We furnish in Wisconsin about 2,000 agricultural laborers, as we call them. That includes some truck gardeners and some hay hands and some people who do sugar-beet work. But ordinary farm hands—the hired men—I should say about 1,200 a year, so far when we have made no special effort. What we have done so far is to cover within a radius of about 100 miles of each of our offices, and we have an office at Oshkosh, one at La Crosse, one at Superior, and one at Milwaukee; within a radius of about 100 miles we do quite a big business in supplying farm hands. We encourage the farmer to come to the office, and we have a room for him, and he talks to the men one by one and takes them with him.

Commissioner O'CONNELL. What is your experience in the matter of getting the same person a job; for instance, suppose I wanted a house girl and I came along and you had a number and I took one away and I came back the

next morning and found the same girl, and the next morning I would find the same girl, how many times do you give the same girl a job?

Mr. LEISERSON. We had one man who is working for your commission here studying the problem who came to our Milwaukee office and copied the record, and one man in the course of the summer had 84 jobs, and another man in the course of about a year and a half had 72 jobs.

Commissioner GARRETSON. How many of those were really casual employments?

Mr. LEISERSON. Practically all of them.

Commissioner GARRETSON. I would like to hear that answered as to the man who was looking for a steady job or was assigned to one.

Mr. LEISERSON. I should say that more than half of the people with whom the employment office deals are men who come back over and over again, more than half; in fact, we expect a man to come around every three or four months. Now that is plain, if you know anything about the problems of unemployment. About half of the people work steady from year to year. Out of every 100 people 50 or 60 have continuous work.

Commissioner GARRETSON. Are there that many?

Mr. LEISERSON. I think so. The rest are laid off from time to time. Now, the men who are laid off are the less efficient.

Commissioner LENNON. Do you find through your work that some of these casual laborers are cured of that habit and become permanent laborers after a while?

Mr. LEISERSON. I should say a very small proportion, and those men are mostly foreigners who have an incentive in the way of a family abroad, and who become casual laborers because they did not know the language, and they have knocked around, but when the time comes and they have acquired the language they have also acquired habits of casual labor that makes it very difficult for them to stand up against, but some of them, a very small proportion of them, do.

Commissioner LENON. Have you hopes that development in time will help the matter?

Mr. LEISERSON. Yes; partly in this way. We have a record of every man we send out of the office. I will leave with you, Mr. Chairman, a list of our records. We have just one card for a man; this is an application for employment. Every time we send him to a job we put on the back of this card the employer he went to, the occupation, when we sent the man, and next day we telephone or write the employer and find out what happened to the man, did he go to work, etc.

Now, if there are men—and there are a large number of them—who want to make half a dollar, their incentive is to get the next meal; hunger is their incentive; we send them out and tell them there is a steady job. The man does not say he does not want a steady job. The men, if they would say they did not want a steady job, we would know that they were casual laborers, but one comes along and says, "Yes, I will take that job," and we send him out and he works three hours and gets 75 cents and quits, and he spoils that job for a man who wants a steady job, and it has given our office a black eye. We get that report and verify it. We take no employer's word, because we find that the employers lie and the workmen lie, and we verify those things.

Commissioner LENNON. For the truth they go to your office.

Mr. LEISERSON. Then when a man comes back to us two or three months later he does not know about this, and he asks us for a job, and we ask him for his name, and we keep all these cards and we take it out and there we see it, and if he does that once we tell him, "You spoiled the job; you may not have known about it, but you have spoiled the job for another man and given our office a black eye, and you must not do it again. If you do not want a steady job, if you want a short job, we will give it to you." If he does it again we tell him, "You need not come here; there are plenty of men who want these jobs and who do not act as you do," and ordinarily we tell him we will not give him any more information about jobs for three or four or five months, and in that way we are tending, not to remedy the problem of the hobo and the tramp, but to throw them on the community and make it more difficult for those fellows to make a living, and then it is up to the community to see how they can handle those people. But the people who actually want to work, no matter for how short a period, we are able to get them work much better than they can for themselves.

Commissioner WEINSTOCK. Briefly, then, your bureau is a bureau of information and not of reformation?

Mr. LEISELSON. Absolutely; we distribute information.

Commissioner WEINSTOCK. You do not attempt to deal with the unfit?

Mr. LEISELSON. Absolutely not, except quite incidentally. Now, on that question of information I might take a little more of your time. Every employment office in Wisconsin, and there are four of them, makes a daily report to our central office in Madison on a sheet like this. This is a classification of the occupations and industries, following the United States census, but following it down to the business we do in Wisconsin. That comes in every day to the central office by industries and occupations and also by offices. There is a white one like this for the women and a yellow one for the men. That comes to me in Madison, and I see that Superior has a big demand for laborers in the woods and not very many applicants have registered. Immediately I see that that demand from Superior is brought in touch with the supply in Milwaukee, and I get in touch with the firm and tell them that laborers may be difficult to get in Superior now, but in Milwaukee we have a certain number of men who can do this work. At the end of the month these are tabulated by a statistical force in the Madison office onto a sheet of this kind, which summarizes the business for the whole month. It gives the supply and the demand and the number of positions filled by cities and by industries and by occupations.

Now, that can not be used for general distribution. Most people would not understand it. But for us that summarizes the whole thing very nicely. What we do is to take that and write a labor-market letter summarizing that information. For instance, here is the heading for October, "Labor-market conditions. Slackening demand and an increasing supply." It is only about one page long, so that the whole of it can get into the newspapers. That is an attempt to distribute accurate information about the labor market. The ordinary thing that happens is that when a farmer needs a farmhand or an employer needs some labor he tells it to the newspaper man, and the newspaper man says, "1,000 men wanted in this place, and a great demand for labor," and the tendency is for people to come there. That is actually what happened with regard to the harvest hands, and by the time the harvest hands got out there there was an oversupply of harvest hands.

Commissioner WEINSTOCK. That is, they have feasts and famines?

Mr. LEISELSON. Yes. What we attempt to do is to distribute accurate information in regard to the labor market.

Commissioner O'CONNELL. How do you avoid the strike business in case an employer comes to you when there is a strike?

Mr. LEISELSON. The policy of impartiality in labor disputes was decided in this way, and it is the practice that employment offices in Europe have had to follow after years of experience. When there is a strike we are in touch with all the union people, and we tell them to notify the office immediately when there is a strike. When that is done we tell the employer that there has been a strike called to our attention. Very often we do not get word from the union men, but suddenly an employer calls for 50 carpenters, and that is suspicious; so we ask him if there is any trouble on, and they know us now. At first we had difficulty in getting the information, but now we have no trouble at all, and they tell us that there is a strike.

We get a statement from the employers of the strike and of the workmen, and the job is listed the same as any other job; it is put upon the board, "Wanted 50 carpenters, strike one." Then any man who wants to go there, we tell him this is the place, and they are striking over there. As a matter of experience we have had practically none who would go once they were told there was a strike. Perhaps they would go without our knowledge, but no one would ask for a card practically to go to a strike-breaking place. I think we have had 10 men in all our two years' experience, and we handle about 40,000 men a year; so you can see how much of a problem it is.

Now, another point in which you would be interested, I think: When these labor-market letters came out in the city of Milwaukee last summer, there was quite a lack of labor, and we just said so in our labor-market letter, and some of the union men brought it before the Civic Federation of Labor, the fact that we were advertising that there was a lack of labor in Milwaukee, which tended to bring a lot of laborers in, and which would put wages down, and so forth, and a resolution was introduced in the Federated Trades Council, as they call it there, to ask the Industrial Commission of Wisconsin to suspend the publication of this labor-market letter. When that happened, the repre-

sentatives of the Federation of Labor asked me about this, "Is not that the fact, that it tends to bring laborers in?" And I said, "No, by no means," and I showed them our letters, the way they go out to the press, and I told them the question is not between having our labor-market letter and no labor-market letter.

If the industrial commission has no labor-market letter, then the employers of Milwaukee, every time they need help, or the Merchants and Manufacturers' Association, would get out a letter that there is a great demand for labor in Milwaukee. What actually happened in Milwaukee was that there was a great dearth of foundry laborers, and our letter said foundry laborers in Milwaukee are practically impossible to get at 19 cents an hour. Now, that goes in at 19 cents an hour. No foundry laborer from Detroit or Chicago will come to Milwaukee because there is a great demand for foundry laborers when he knows the wages are 19 cents an hour, because the wages are higher in other places. That gives him the accurate information. If we do not give that out, then the Metal Trades Association would get out an advertisement, "Foundry laborers wanted in Milwaukee, good wages paid." That is the way the ordinary "ad" runs. And when that was explained to these men, and the copy of the labor-market letter was read before the Federated Trades Council, the resolution was withdrawn. The employers with whom we have had to deal have had no objection to our publishing letters of that kind. If they had, they never told us anything about it, and they give us their patronage, and they think it is the fair thing to give accurate information about the employment situation.

Commissioner WEINSTOCK. What effect do these public employment offices have upon the private agencies?

Mr. LEISERSON. I am glad you asked that question. We have gradually taken up a little bit of the business of the private agencies. When the industrial commission took over the employment offices, that was in 1911, when we began to organize these, we had been in existence for nine years before that, and an investigation was made of all the public offices, and we went to the private agencies to see how they were running their business and we asked them what they thought of the public offices, and they told us, "We don't know they are in existence, we do not feel their competition at all, we do not know they are existing." After we reorganize them according to the methods I have spoken of here, about eight months later all the employment offices in Milwaukee got up a petition and signed it and sent it to the secretary of state, who was then issuing the licenses, and protested against taking their money as taxpayers, a \$100 license fee from each of them and putting that into an employment office which was competing with them and putting them out of business. From their point of view that is a very fair objection. Their point of view is that the distribution of information about labor conditions is a private business, and they ought to be able to make a living at that particular business. But that showed what the effect of the movement was under the reorganization, it was taking their business away. We have taken away practically all of the business in Milwaukee of the man that handled the regular floating hobo labor, the railroad work. We have not touched anything with regard to the immigrant labor, but recently we have hired an interpreter that speaks all the languages, and now we are gradually getting away that business, but we can not put them out of business by competition. I think that is settled.

The reason is this, that the employment office business is a peculiar one. A man runs a little candy store or a saloon; if he has one or two foremen in a big factory who are his acquaintances, with whom he can divvy up, he can make about \$3,000 a year, and that is pretty good wages. If he sends out not more than a thousand men a year, and that is a very small number, the way these gangs work, he has one or two people to call upon him for help and who discharge men at the end of a month very often to make room for others, and he gets out of these men a commission, during the summer time, from unskilled immigrant workers about \$4, and \$2 goes to the man who hires the help and \$2 goes to the employment agent, and in the winter they pay from \$9 to \$10 for their jobs. Now, a little fellow running a candy store or a saloon runs that on the side and makes two or three thousand dollars on it. So no matter how much of a public business you have you can not compete them out of business, and so you must have go with the public agencies a regulation of private agencies under the jurisdiction of the public offices. Now, private office men will tell you it is not fair to compete with them or to give their

competitors control over them. From their standpoint that is true. They look upon it as a private business and that the Government is invading their field of private business and is competing with them, and their competitors should not be given control over them, and those private agencies have in most States, as, for example, in Illinois, been able to have a separate department run those employment offices from the regulation of the private ones. They say it takes a crook to catch a crook.

Now, it takes an employment agent to catch an employment agent. You can not find out the abuses in the employment-agency business unless you are in it yourself, and they can put it over you every time; and that is why it is important that the people engaged in employment-agency business shall regulate the private agencies. And on that point I wish to submit to your commission some of the laws that have been passed on that question in Wisconsin and other States; and, in fact, this suggestion that I made about putting a man on the subject of the distribution of labor includes the establishment of a system of public employment offices and the regulation of private agencies. The two have to go together.

Commissioner DELANO. Do the manufacturers know that their foremen are accepting fees?

Mr. LEISERSON. In very many cases, no. In fact, there have been cases where, when it got higher up, the foreman was discharged. In some cases they do know and do not care.

Commissioner WEINSTOCK. Do the public offices handle domestic servants also—family labor?

Mr. LEISERSON. Yes; we have a woman's department and a man's department; and we have a common labor unskilled department and a semiskilled and a skilled department. If there are any other questions—

Commissioner LENNON. If you would come in every day we would all be Socialists, the first thing you know.

Mr. LEISERSON. Well, I would not object.

The CHAIRMAN. Is Mr. F. C. Croxton present, the president of the association of which Mr. Leiserson is secretary? I understand he has some suggestions or information to offer us.

STATEMENT OF MR. F. C. CROXTON.

Mr. CROXTON. Mr. Chairman and members of the commission, I am going to take a little different method than that followed by most of the speakers. I am going to start out by saying that I do not believe the commission will know just how far they will want to go in recommending machinery for the distribution for labor or for bringing together the man who wants a job and the man who wants help until you have made a thorough investigation. And I, as president of the American Association of Free Public Employment Offices, ask that you make such an investigation. We believe that unemployment is one of the big problems you have to consider. It is one of the fundamental causes of industrial unrest. We would like for you to make an investigation at an early date covering these points—that is, looking toward increasing the efficiency of public employment offices—if, in your judgment, they are found to be one of the best means of distributing labor and increasing the efficiency of the force, the records, and the methods of work. Second, cooperation within States and between States. I can say to you that within States where there are four or five employment offices at the present time, in most cases we know nothing about what the demand is in any particular locality until the end of the month, when it is merely statistics that are presented and nothing else, and they are not useful except just to add numbers together. Also looking toward the regulation of private agencies, to prevent exploitation of workers. That would include private agencies doing an interstate business and private agencies doing an intrastate business solely. A number of the public employment agencies that we operate at the present time are very efficient. A number of them are efficient in varying degree. If you can do anything to help us in the States to make them efficient we would be glad of your assistance.

The CHAIRMAN. Dr. Edward T. Devine, whom you all know is the chairman of the committee which recommended the legislation which resulted in the appointment of this commission to the President, and who afterwards promoted it in Congress, is present, and we would be glad to hear from him.

STATEMENT OF MR. EDWARD T. DEVINE.

Mr. DEVINE. Mr. Chairman and members of the commission, to take advantage of this introduction I should address you as my children, but I think you would take that as a very absurd liberty, and ask me to stop, before going further; but yet if I used that expression I would not be expressing more strongly than I feel, my interest in the commission, which, at least, if not parental, is sympathetic, and if I can be of any use it will be for a couple of minutes turning the hands of the clock back a couple of years, when, this very week to a day, a petition was in circulation asking the President to recommend to Congress the creation of such a commission. The atmosphere was thick at that time with interest in the acute industrial situation. Now, those who took the initiative in securing the creation of a commission of this kind, as a thing which they believed would contribute more to social progress than anything else which could be gotten out of the widespread public interest, saw before the commission, if it was established, the greatest opportunity which could be given to any people, and I think that some of them, looking at it with interest and sympathy for the last two years, are now a little afraid that the one danger of not realizing fully upon that opportunity lies in the virtues and the breadth of interest in the members of the commission and in the suggestions which will be made to you by people like myself, who come before you to give advice. I myself am instructed as the chairman of a committee on social insurance to come here and ask you to spend a part of your quota of time to investigate the subject of social insurance, but responding as an individual to your invitation, I am obliged to say to you at the same time, if you accept that suggestion, I shall have a very poor opinion of your judgment.

One danger which I see before the commission is that under the pressure from people who are profoundly interested in important subjects, the idea will go abroad and may even possibly to some extent influence the commission itself, that it is a commission on the state of the Nation, instead of a commission on industrial relations. I, for one, Mr. Chairman, do not believe that "Safety first" is a good slogan for this commission. It is an admirable slogan for a committee on safety or a national council on industrial safety or for anybody who is primarily concerned with the prevention of accidents. It is so important a subject that I think any member of State or National commissions might easily be created on the prevention of accidents, and there are many ways in which that subject should be studied. But if this commission were to give a large amount of its time and energy to the subject, it would, I think, be misdirecting the commission which has been given to it. It should be investigated only so far as it has to do with unrest, with strikes and lock-outs and industrial disputes; and, in my opinion, while there is some relation between the two, it is not so direct or important as to justify a large part of your time and attention being given to that subject.

As I have just intimated, I am directly interested in the subject of social insurance, workmen's compensation, old-age insurance, and every kind of social insurance. It is a tremendously important subject and should have consideration by a commission appointed to investigate that subject and do nothing else. But for this commission to divert its attention from the question of the settlement and prevention of industrial disputes to a broad study of the subject of social insurance I think would be making a profound mistake. Of course, there is a relation between social insurance and industrial disputes, and that needs to be pointed out, and to some extent to be studied; but what I mean is, you should not accept any suggestion, whether it comes from my committee or wherever it comes from, that your agents should spend their time and you should exhaust your appropriation in making a very profound study of social insurance in all its phases and as to the proper legislation to be enacted. I feel the same way about country life and all its problems and I feel the same way about unemployment. I do not think this commission should devote much attention to that subject, for two very good reasons. In the first place there was a report published, and Mr. Leiserson gave you one reason why he thought it was a good report, because he wrote it. I may say in the same way that I know it is a good report because, as a member of the faculty of Columbia University, I participated in giving him a doctor's degree on the strength of that report, thus testifying to its accuracy and soundness.

The subject of unemployment should be studied in every conceivable way, and all of the available experience should be gathered up and put at the disposal of the people who are especially interested in that subject. But for the

other reason which Mr. Leiserson has mentioned, it seems to me it is not a fundamental or even an essential part of the work of this commission. In explaining the administrative work of the Wisconsin commission, Mr. Leiserson pointed out that it was regarded as fundamental that the getting of the job should be entirely separate from the conflict between labor and capital; it is a distinct thing. That action is only an evidence of their appreciation of the fact that it is a distinct problem. So it seems to me it should not engage a large portion of your attention.

The subject of welfare, Mr. Fitch made some reference to it and some questions were asked, and Mr. Fitch's opinion was asked as to how far the commission should go in investigating that subject, or what conclusion it should recommend. My advice is, cut it out altogether. It is not so important, it does not have so direct a relation to the question of strikes and lockouts and disputes and misunderstandings that it can legitimately claim any considerable part of your attention. It is irrelevant in my opinion to your discussion. It is exceedingly important to the employers, and it is exceedingly important to the immediate employees concerned, but not an important work in the immediate program which is put before this commission.

Now, having expressed this opinion in the negative on some propositions which have been made to you, and the same line of reasoning will apply to many other suggestions which other people will make, it is but fair that I should, perhaps, try to formulate, in a word, what the specific thing is that it seems to me you were appointed to investigate. I think it is written large in the act of Congress by which the commission was created. Why are strikes? How settle strikes? How prevent strikes? How make strikes unnecessary? It seems to me in those four questions you have an outline of the specific task which lies before the commission. Or if you prefer to express it from the point of view of the employer: Why discharges and lockouts—how may those be prevented? How may greater stability of employment be secured? How may the unnecessary loss of workmen be prevented, when the quality of their work is satisfactory, merely because of some labor unrest, because of some participation by a labor agitator, or whatever it is that is causing the disturbance of the relation which the employer would like to have continue to exist? Or if you want to put it from the point of view of public order which was so forcefully brought to the public mind just after the McNamara confessions and all the discussions which arose out of that: Why violence? How control violence? How prevent violence? I do not like to add the fourth question: How to make violence unnecessary?—because as a law-abiding citizen, I assume it is never necessary, but to put it this way: People have grievances, and how to cure them, and what means are created for discovering what their grievances are, or bringing them to light; in other words, how to establish and maintain industrial justice?

You are authorized to investigate the condition of labor. Various things were added to the act for the purpose of giving the commission the broadest possible power to investigate any aspect of the subject into which in your own judgment it might be necessary to go. But the crux of the investigation and the questions which must be answered by this commission, if you are to satisfy the legitimate public interest which led to the creation of the commission, are these questions relating to the acute unrest, the violence, the disputes, the strikes and lockouts, and why those occur, how to settle them when they arise, how to prevent them and maintain mutually advantageous and peaceful relations, and how to insure such orderly and reasonable progress, such just and legitimate sharing of the product of industry as will make people unwilling to resort to those extreme measures—to strikes and to violence.

Now, in the running down of these questions you may have to go far afield; you may have to study Karl Marx and the socialist literature; you may have to study the labor press; you may have to study Papal encyclicals; you may have to go to the Old or the New Testament. I do not think any man would set a limit to the places where you should go statistically or in the form of witnesses whom you bring before you. But I think there are some things which are obviously and necessarily included in the study. I think the functions of the trade unions, their services, their actual operation, their methods, their finances, all of their internal management of their affairs, and the results that they accomplish are a necessary part of your inquiry. And I think that the activity of the Manufacturers' Association, its finances, its methods, the particular things that it does in connection with labor disputes and has done, should all be carefully and thoroughly investigated, using the full powers conferred upon you to send for witnesses and papers. Citizens' alliances and em-

employers' organizations of all kinds, as well as labor organizations, should be brought before you, and with courage and thoroughness, with a determination to get at the bottom of the matter, you should lay bare the actual industrial relations of the present day and the relations of the employers and employees.

Why disputes? How settle disputes quickly, reasonably, and with a minimum of hardship and suffering and disturbance? How prevent disputes, and how insure that our modern legislation and State administration and judicial acts shall all be so shaped as to insure the maximum degree of justice and progress and prosperity to all the people concerned? So that I feel that on the work of this commission my mind is a harp with a single string, which is very much broken and is worn by frequent repetition of it, but if I have any one piece of advice or message to give, it is to concentrate upon the nature of industrial disputes and to go wherever it is necessary—to Dublin, if necessary at the present moment, to Calumet, to West Virginia, to Colorado, to Patterson, to places that have recently been storm centers of industrial conflict, even if they are not so now; Lawrence, Little Falls, and so on. I think that this commission at the present moment should have its own agents investigating the disputes that are in progress at the places where they are in progress, and during the time that they are in progress, and that you should not be doing that by calling witnesses before you in public hearings, but with the most expert service under the control of your own commission or with the cooperation of the Department of Labor you should be getting at the real facts of these controversies and discover what their nature is.

We all know it is not merely a question of wages. I happened not long ago to be asked to act as an arbitrator in a labor dispute. I did not know what it was until I arrived at the place of meeting, when there was placed before me a signed agreement, signed by the employers' association to which the employer belonged, and their union to which the employees belonged, in which they definitely agreed to submit to me and abide by the decision as to the question whether the employer had assaulted one of the workers, and if so, what damages the employee should receive if the employer, as the union charged, had disregarded his agreement and violated it and continued it persistently for a number of weeks, and if so, what damages the union should receive for such violation, and finally what changes should be made in the agreement between the employer and the union in that particular case. It is amazing that any employer should be willing to submit questions of that kind to an arbitrator. It is amazing that an employer or union which felt that it had been damaged should be willing to submit such a question; and yet there was laid bare the kind of things which are causing industrial unrest, and which are causing disturbances. There was even some little violence before that particular arbitration was concluded, but it was concluded finally to the satisfaction of both parties, and the employer paid the damages assessed against him and put himself under heavy bonds to observe the terms of his contract in the future.

If that and a few other experiences I have had are at all typical, they indicate that the reasons for the unrest are very much more complicated—and all of those reasons of course will be very well known to the gentlemen who have been associated with the labor movement; they are very much more numerous than the general public at all understand. And if this commission can as a result of its labors set forth the real nature of those causes of friction and can, from the ends of the earth, if necessary, or out of your own brains, devise means by which they can be settled with less suffering and expense and trouble than they are now, I think the commission will have served the purpose for which it was appointed.

The CHAIRMAN. Mr. L. A. Halbert is with us. Mr. Halbert is superintendent of the Kansas City Board of Public Welfare, and one of his activities is unemployment, and seasonal employment, and he has some suggestions to make to the commission.

STATEMENT OF MR. L. A. HALBERT.

MR. HALBERT. I am glad to follow Dr. Devine, Mr. Chairman and members of the commission, who has set forth so clearly what it seems to me is the central or starting point from which the work of the commission should take its impetus. I want to say what general things I have to say first, and leave what I have to say with regard to unemployment for the last.

You are here because there is strife, and an indictment or complaint has been made against the industrial system. It would start in an address urging the appointment of this commission that conditions had changed, so that the

Industrial system we have is not adequate to meet all the exigencies of the present time. So whether we say the industrial system is defective or not, we ought to ask the fundamental question what it is expected to do. We have a system of industry controlled by private individuals, and out of the proceeds of that industry is supported every form of comfort and luxury we have as a people. Out of the proceeds of industry comes the support of the church and the school and from it comes the money for charity and every kind of thing that we have. We, therefore, depend on this underpinning of industry; and especially out of industry comes the bread and butter of the people. And the people of the Nation in recognizing this industrial system have cast their entire welfare, their entire living into the hands of an industrial system operated by certain private individuals. We therefore have to ask of it that it shall, in the process of its operation, supply us with all of those things. If there is a deficiency in any of those things we must ask the Industrial Commission why there is a deficiency in those things. And if there is strife, it is because there is a complaint, a feeling that a wrong has been done, or that injustice exists, or that the industrial system has not furnished the people what it ought to furnish. And where there is a strike and strife, it arises largely over the question of bread and butter or wages.

In the second place, the next thing that is most fundamental as a cause of strikes and strife is the feeling that there is a lack of justice, or that rights have been denied, or that there is no possibility of getting redress for grievances. And it seems to me that about these two things is the principal inquiry to be made about the wages, distribution of wealth, desire for support on the part of people who depend upon the industrial system, and the desire for justice growing out of the industrial system.

Now, let us find out whether the industrial system has furnished the people with a living, on which system the people depend for a living. It has been said by our Census Bureau that the average earnings of wage workers is \$455 a year, and it has been set forth by social workers and by Prof. Chapin in his book on the cost of living that it costs from \$800 to \$1,000 to maintain a decent standard of American living for a family. Of course, the gap between \$450 and \$800 to \$1,000 is made up partly by the employment of other members of the family than the single breadwinner, when there is more than one, so we can not say that all wage earners fall that far short of a decent living. But it has been borne in upon me that a majority of the people of the Nation have less than a decent standard of living, according to this standard which has been set down. Now, I tell you that is a terrible indictment against our industrial system. The majority of the people have less than a decent standard. The question of whether it supplies a decent amount of bread and butter for the people ought to be asked and answered, and if it does not we should find out why not. The question of the efficiency of the industrial system to provide the things we ought to have to eat and the equitable distribution of it in the form of wages should concern this commission.

The matter of a desire for justice is the next question. We have expected that the industrial system, when there were grievances and difficulties arising in it, would be able, through economic forces on the inside of it, to throw off these difficulties and would be able to solve them itself. What machinery has grown up in the industrial system to meet these demands that we should have a reasonable amount of support? Wherever there is a grievance the machinery by which it is settled at the present time, which has grown up inside, is the machinery of labor unions, trusts, and employers' associations, and the enforcement of the demands of these organizations is by means of strikes and lockouts and blacklists and union labels; and where these measures have been unsuccessful they have gone on with further penalties, to introduce sabotage or introduce violence or introduce other means to try to make effective what they regard to be the product of these organizations. This is the machinery which has grown up of itself. Is this a satisfactory machinery for dealing out justice and settling the problems? Is it adequate to give the people justice and solve the problem? I do not believe myself that unions and industrial organizations and employers' associations, no matter how much freedom to organize unions you may have, are a sufficient machinery for redress of the grievances which not only laborers have but the general public has in regard to the shortcomings of the industrial system.

If we are not satisfied with these measures—and let us say first if we are—if we are going to put our faith in this kind of machinery, then let the Government keep its hands off of that kind of machinery and say we will trust to that kind

of machinery. If some one by the operation of that machinery is killed, and there is violence, that belongs to the regular machinery of the State, and people are put in prison and killed on the scaffold; and if that is necessary in order to find the solution of these problems, may be that will have to happen. If we are satisfied with the machinery which metes out these tremendous penalties and suffering, and let that be in the hands of unions and employers' associations and industrial and economic machinery, let us have faith and depend on it. I do not believe in it or that it is sufficient. If it is not sufficient for the redress of grievances, what other machinery can we have?

Now, that theory that that is sufficient has gone a long way and has been embodied in our whole procedure, so that the courts say that we have this machinery, that it is enough, and therefore we ought not to interfere with it, and therefore that legislation to control industrial difficulties is unconstitutional and illegal, etc. Of course, I do not think this commission ought to be stopped by the fact that there are great legal difficulties. If there are great legal difficulties you should go behind them and remove the legal difficulty.

You should not allow the fact that a legal difficulty is in the way to stand in the way of saying if it should be removed. But if the idea has come to be accepted by the general public, and I think it has, that this machinery of internal and economic forces is not sufficient, and we must have government and regulation of industry to a certain extent, and we are having it more and more; if you could in some way sit up there as judges and put on some ermine and assume an air of antiquity, if necessary, in order that you might hand down some kind of an opinion that the courts could quote, for it has been said that the courts stop these things; when you go up to the court with regard to the reforms in a legislative way, if they could quote your opinion or do something which would add dignity to the opinion that the time has come when the economic machine is not sufficient, but that we need to have Government machinery in this thing, so that you could explode in the minds of the judges the idea—and I think that is about the only place it still remains—that you can not have Government regulation, but should have economic regulation, you strike a blow at the fundamental difficulty. We have not enough machines or means for giving redress to grievances. As long as people feel that they have no means of redress of grievances of course they are going to be bitter, and that is the cause of the bitterness, because they feel they have not the necessary machinery. And when you start out with economic machinery you can say it is unethical, and when you say we will provide Government machinery the courts say it is not constitutional. If you could explode that theory so you could get a free hand whenever Government regulation is necessary and say we will not go any further than is necessary, but that we have a perfect freedom to institute any Government regulation that is necessary, I think you would do the most fundamental thing you are here to do.

If you accept and rely on Government machinery, the question might arise, What Government machinery would I recommend that we should have to settle these disputes which are not adequately settled at the present time? I will speak of two lines. With regard to the wide extent of poverty and dissatisfaction and distress in the Nation, I think that is one of the things to which you must address yourselves. Now, then, the conditions on which business, if it is going to be run by private individuals, should be allowed to continue to operate is that you should fasten on it definitely the support of the people, so that that would be a condition on which it should proceed. How can you fasten the burden of caring for the body on the industrial machinery of the Nation? There are various ways, and I think chiefly through industrial insurance. You may not be able to devise directly the forms of industrial insurance. I was in direct sympathy with what Dr. Devine said, and yet I think you must look to some way of fastening on the industrial machinery the burden of supporting and taking care of the people.

Suppose the industrial lords and systems should say you should not interfere with them, we have a right to control our own business. Well, we have the right; we own our own business. What should we as a people say to a business that maintained that right and still did not support the people? We might come back at them with this thought: All right; you have your particular property and business, but how long would that control and the enjoyment of that right last if it were not for the policeman recruited from the ranks of labor, if it were not for the soldier recruited from the ranks of labor mostly, or if it was not for the citizen?

Suppose you own your property, you do not want it taken away from you. We would say, you take it and we will withdraw the protection you have for your property, and you can sit down and enjoy it yourself. How long would that property last? The next man would come along and say, "I want this property," and you would say, "Well, it is mine." The man would reply, "Who said so?" "The Government said so." "No; the Government has withdrawn from that kind of an agreement with you, and it does not say so any longer." "I believe in taking turns as we used to do when we were children, and you have had this for a long time, and now it is my turn, and I will take it." Don't you see where a man owning property would be? The very existence of his business depends on the fact that we are willing to guarantee that right with our blood, and with our policemen, etc.; so it is not unfair, in an arrangement of that kind, to challenge him and say, so long as the existing of your power depends on the guaranty we furnish, as a condition of furnishing the guaranty, we have a right to ask that a condition be imposed, and that is that ability should have enough to support itself.

Dissatisfaction and poverty come through low wages partly, and partly through the exigencies of old age, and partly through the results of accidents, and partly through unemployment, and all these other means. Suppose you say to an employer that he must, out of the proceeds of his business, provide insurance against unemployment, and that he must furnish funds to provide for old-age pensions, and must furnish accident compensation, and that he must furnish an adequate wage. We have not enough machinery to decide what wages ought to be. Of course the minimum wage is something, but the machinery of arbitration by which you could determine a just and scientific wage based on the idea of cost accounting would come nearer to what we ought to have, ideally.

Then the condition of what is a just wage, what compensation, what is necessary for the support of people, must be established. How? Well, to begin with, you must have publicity of accounts, and they must be kept in such a way that you can get at what the profit of the business is and what the cost of this and that and the other thing is, and this thing will never be settled until you settle that distinctly. How can you settle it unless you have the information, and how can you get the information unless you have all the facts and publicity of those accounts? After you have done that you have some basis for deciding wages. After you have provided, through minimum-wage boards and arbitration boards, some decision as to what is a just wage, then enforce it, and add that just wage to the unemployed insurance and to the old-age insurance and the sickness insurance, and all these other burdens which are necessary for the prevention of dissatisfaction, and say, now this is a part of the cost of operation and you have to pay that or you can not operate a business. Suppose a man should say, "I can not operate a business and pay all of those charges." Well, if he can not, he must charge more to the public, and if the public does not want his product of his business bad enough to help support the workers who are in it, they do not need it very badly, and if they are not willing to support the people who produce it, he had better get out of that business. If these people are not supported directly out of industry, what is going to happen? As a matter of fact they die; that is what happens.

The ordinary wage workers and unskilled people die about twice as fast as other people. It is a fact that it takes their lives gradually, when they are not adequately supported. What kind of an answer are you going to give? Are you going to make this indictment against the industrial system which allows that condition to exist? If you will hold out to the community that it is not a just thing, it seems to me you would be doing a good thing. You have to carry them out of charity, out of taxation, and so on, where it ultimately comes out of the business just the same. Why not charge it to the business in the first place rather than take it out afterwards by taxation and so forth, to take care of the destitute? Because nobody advocates that they should die. I have said all I care to about destitution.

With regard to the machinery for providing justice. The union that comes up with a grievance has perhaps some chance of having its grievance heard and some award made on it through an arbitration board or any other way, and yet they have great difficulty in organizing unions, and securing through the organization of unions what they claim to be their rights or justice. But what is more embarrassing is the complaint of the individual worker himself. Suppose he comes up to his foreman or his employer with a complaint. I had this brought home to me with tremendous force one time when I was in settlement

and home missionary work. I went to the home of a poor woman who had lived on a sand dune in a shack of a house to take her some kind of help. She told me she had a grievance about a mistake in her time at the factory where she worked near-by. She talked to me about her responsibility in trying to raise her two children; she was a widow. Then she asked me, and I had not proposed it, although I was willing to perform that kind of service as a church worker, if we could not have prayer. And she prayed and she said, "Oh God, take the bitterness out of my heart, so that I can be fit to be a member of society in the world and have the spirit which will make it possible," or some such language as that.

She went on to say, "Give me some way to get justice where I have this grievance," and she stopped and could not say any more. And afterwards she said to me she went to the man and complained about her time and said that she needed this money, and he put her off and would not make the settlement, and when she pressed her claim he said, "Well, if you don't like it get on out; there are plenty waiting at the dock who would like your job." Her grievance may have been small, but she felt that the machinery to provide a redress was not there. And if the spirit of bitterness remains, it is awful. It has been a fact, and is a fact throughout the country in general, where people have a small grievance they do not have adequate machinery for redressing it. It has been evidenced by the experience we have had in establishing a legal aid bureau in Kansas City. People come with their grievances against their employers; 20 came the first day it was opened, and sometimes now 65 or 70 come in a single day. As an instance, a man came into the bureau one day with this grievance: A man employed certain laborers in a restaurant, and he refused to pay this man and other men at the end of a day or two of work, and he said, "Your work has been unsatisfactory; you have been in the way around here. I don't owe you anything. You have had your food and that is more than you ought to have." Those men went back to take it out of his hide, as they say, and he brought them into the police court and they told their story to the magistrate, and he said there is a way for you to settle this. This is not the way—to disturb my peace. And what was the way? He could go to the court and put up \$3 for costs, sue the man and lose a day's time and have his friends there and have them lose their time, and thrash it out at a cost of \$30 or \$40 in order to get one day's wages.

When you come to realize the feeling of people who have grievances which they can not have settled except by the expensive operation of law you begin to have some idea of the acute sense of bitterness in their minds when they would have absolutely to lose money or have it settled in any way the employer chooses. Against the fact that the employer in the large majority of cases would do the thing that was just is the very fact that he is at the mercy of the employer and does not have anybody to say, between him and the employer, what should be right is one of the causes of the feeling of bitterness and social unrest, and we must establish the machinery for the redress of grievances through Government agencies.

The CHAIRMAN. It has been suggested that we adjourn now until a quarter after 2, and we will now take a recess until that time.

(Whereupon, at 1 p. m., a recess was taken until 2.15 p. m.)

AFTER RECESS.

The commission met pursuant to adjournment at 2.15 p. m., with Commissioner Delano as the acting chairman.

The ACTING CHAIRMAN. Commissioner Walsh has been detained at another meeting and asks that we begin the hearing and asks me to act as temporary chairman. Mr. Halbert has not finished what he was saying.

STATEMENT OF MR. L. A. HALBERT—Continued.

Mr. HALBERT. I was saying that the principal evil or failure of the industrial system was the failure to provide support for the people and to satisfy their demands for justice or the means of redress of their grievances and that the original idea was that the industrial system would supply for itself the economic organizations and forces and machinery for righting these wrongs and that this machinery had proved to be inadequate and that it seemed to me that the commission would thoroughly establish that, so that the starting point for regulating these evils might be that of Government regulation rather than

internal regulation; that in changing the point of view of the base from which people started to remedy the evils of the industrial situation, that would be an important step forward.

I suggested then that if we were to have government machinery for this purpose, to begin with, to remedy destitution, we must have various forms of social insurance, and we must have arbitration boards to fix different rates of wages in some cases, and wage commissions to fix the minimum wages in other cases. All these things having been fixed as a burden upon industry, they must be carried by industry as a condition of its existence. Then that we should remedy the hunger and supply the demand for justice, by supplying more machinery in the way of boards of arbitration or inexpensive courts for the people who had grievances, so that they might bring them there to have their grievances righted, without having to spend so much money on litigation before they could get their grievances aired, and that that would satisfy more or less their desire for justice.

With regard to the particular problem of unemployment, I have not said anything, and I shall not say it, because Mr. Leiserson covered that so completely; but I want to call attention to one or two things.

If employment bureaus are to be a thorough-going and highly effective remedy for unemployment, it is necessary that we should have a complete chain of employment bureaus throughout the nation. It was estimated by the New York Industrial Commission in 1911, that there were 60 public free employment bureaus in the United States and they secured a total of over 300,000 jobs in a year. The number has perhaps increased since that time so that we may estimate that various public employment bureaus secure 500,000 jobs per year at the present time, but a bulletin on the statistics of unemployment and the work of employment offices, issued by the National Government, October 15, 1912, shows that the various tests which they applied to groups of workers in the United States indicated that from 10 to 50 per cent of the laborers in different parts of the United States were unemployed part of the time during the year.

Perhaps there were 25 per cent of all the people engaged in gainful occupations in the United States who suffered from involuntary unemployment at some time during the year. If there are 40,000,000 people in the United States engaged in gainful occupations, and 25 per cent of them are in the state of involuntary unemployment during a part of the year, then there must be 10,000,000 unemployed people in the course of the year who should be furnished jobs, while the total number of jobs secured by public employment agencies is only half of 1,000,000. In other words, only one-twentieth of the unemployed people could be served in the course of a year by our free public employment bureaus.

When you consider that various unemployed people get several jobs through the employment bureaus in the course of the year, and that the other people not served by the employment bureaus need more than one job apiece to keep them at steady occupation, it is easy to see that less than 5 per cent of the unemployment in the country is touched in any way by our employment bureaus. From all this it can easily be seen that the number of employment bureaus must be greatly increased and the volume of business done by those already in existence must also be increased until we have a complete system of employment agencies throughout the nation.

Employment bureaus offer no way to control effectively the evil of unemployment until they can secure control of enough of the total opportunities to work, and direct the movements of all those seeking employment to such an extent that they may be said to control the labor market of their community or of the country. They may perhaps be extended to something like these proportions by the methods already used to build up such employment agencies as we now have, but their ability to get control of the labor market would be considerably increased if they could become the agencies for administering some form of unemployment insurance. This feature will be elaborated under the head of unemployment insurance. One of the principles which it is necessary for public employment agencies to observe is that of strict neutrality in case of labor disputes and full publicity in regard to the existence of all labor strikes or other labor troubles in any proposed place of employment.

PRIVATE EMPLOYMENT AGENCIES.

Having discussed public employment bureaus, I wish to call attention to some facts in regard to private employment agencies. Mr. Walter Sears, superintendent

ent of the Boston Public Free Employment Bureau, reported at the Chicago conference that when his agency began to operate some six years ago, there were 135 private employment bureaus in Boston, and since that time, the number has been reduced to 90. Kansas City has 49 employment bureaus, public and private, and 19 of these are free employment agencies, 1 being conducted by the State and another by the city; several by philanthropic agencies; and some by business colleges and typewriter agencies which make no charge for their services. These free employment agencies get about two-thirds of all the jobs which are secured through employment agencies. All of the agencies of Kansas City get a total of over 99,000 jobs per year. The private employment agencies therefore get about 33,000 jobs.

As far as I know, there are no available statistics which show the extent of the operations of private employment bureaus throughout the country, but their numbers far exceed that of public employment agencies. They seem to be most useful in handling the higher priced positions. They do not seem likely to have any very important effect in reducing unemployment. The most fundamental weakness in connection with them is the fact that those most in need of employment are least able to pay the fees demanded by private agencies. Besides this, they are subject to the following abuses:

1. Collusion between employment agencies and labor foremen to keep the labor force shifting and thereby increase the number of fees collected for jobs; the foremen who does the hiring and the agency sometimes splitting the fees.

2. The placing of people already employed in new positions of the same or possibly better grade so as to fill two or three positions by the shifting process; some agencies even going so far as to undermine employees and offer new ones of supposed superior quality, all for the sake of the fee. This process works injustice, especially where the agency charges a per cent on the annual salary of those placed, whether they hold their positions permanently or not.

3. The charging of excessive fees to people because of their financial distress or necessities.

4. Misrepresentation in regard to the qualifications of applicants and of the character of positions, especially as to the permanency of positions, sometimes excusing themselves by saying that they can not get men to go at all to jobs that last only two or three days, and so they tell them that the job is permanent.

Private employment agencies therefore need to be supervised by the public authorities; and in Missouri, Wisconsin, Indiana, and perhaps other States, private employment agencies are supervised by the labor department. Mr. Duffin, superintendent of the public free employment agency in Terre Haute, Ind., reported at the conference that the private employment agencies of Indiana have to make monthly reports giving in detail the number of people for whom they secured employment and the names of all the firms who gave them employment, together with the numbers to which each firm gave employment. If they find that a certain agency furnishes most of the laborers for a given firm, and that they furnish a considerable number month after month to that firm, then they inquire to see if there is not collusion between the foreman employing men for that firm and the labor agency which furnishes the men. If they find that there is, the license of the employment agency is revoked. Mr. Duffin further reported that since he had been operating the public free employment agency in Terre Haute all the private agencies had been driven out of business. There seemed to be a general feeling that if private agencies were effectively regulated to prevent the abuses mentioned above and were compelled to compete with free public employment agencies they could not long continue to exist.

UNEMPLOYMENT INSURANCE.

The theory of unemployment insurance is very attractive, but it represents a line of reform which is very difficult to apply. I wish to make the following general observations:

Full indemnity for losses which occur through unemployment is impossible. Unemployment benefits can only be paid out of the surplus which is produced in times of employment. If there is no such surplus there can be no indemnity. So far as unemployment insurance has been applied it has only affected a comparatively few skilled workers and has been universally connected with organized labor. It has never reached the mass of destitute unemployed in any country.

Funds for supplying out-of-work benefits are raised among some unions in the United States by assessments on the members. Funds of this kind are sup-

plemented by public subsidies in a few places in Europe. Voluntary unemployment insurance by organized workers might be encouraged in this country by a supplemental subsidy from the Government, or the Government might possibly offer to all patrons of public employment agencies certain additional out-of-work benefits, provided these patrons of the public employment agencies deposited assessments with the bureau as an insurance against unemployment, and all employers might be taxed a certain amount to go into a general unemployment fund, which tax could be in proportion to the number of employees belonging to that firm; and also the rate might be based partly on the risks of unemployment which were involved in the industry. This would supply some incentive to the industries to try to wipe out the rush seasons and other fluctuating elements in their various businesses and in that way tend to reduce unemployment.

A certain advantage might also be offered to all employers who would guarantee to secure all their help through the public employment agency. This would then enable the public employment agency to place the unemployed whom they were attempting to insure against unemployment. Of course, those who were insured against unemployment should be required to ask for work at a stated time each day at the public employment agency before they could be entitled to any benefits from the insurance fund, and if commercial employment could be furnished them, then the obligation to furnish them other work would disappear. If employers would have their assessments for unemployment insurance reduced by agreeing to get all their employees from the public employment bureau, and if workmen could only secure the benefits of unemployment insurance by seeking their employment through the channels of the public employment agency, these would be powerful factors in enabling the public employment agency to organize and control the labor market. By thus getting control of the labor market they could measure accurately the volume of unemployment and furnish the data on which further action to provide for the unemployed could be based.

EMPLOYMENT ON PUBLIC WORK.

Unemployed labor is an absolute waste to society and the State should regard it as against public policy to support people in idleness, and should rather utilize the labor of the unemployed even though it is not quite productive enough to be entirely self-supporting. The payment of out-of-work benefits is no cure for unemployment. It simply recognizes and perpetuates unemployment. This not only wastes human resources but very much unemployment tends to the deterioration of the unemployed so that they may eventually become unemployable. Instead of paying "out-of-work benefits" in cash, the State could truly conserve our human resources by using the funds collected for unemployment insurance to establish industries which would utilize the labor of these men to some purpose, even though the industries were not commercially profitable, but actually had to be subsidized to a degree. By this plan the State would make the funds raised to insure people employment actually insure them employment, but never insure them support in idleness, and it would also make the insurance funds go along way and not make unemployment insurance seem a great burden on industry. This would supply a certain protection against destitution to any man who would work; but the State would not guarantee any man work at his trade or at his accustomed wages. This might seem to some to be a meager protection after all, but it would at least be a step and would protect the able-bodied worker from the necessity for charity and the public from any demand for charity from them. This plan is morally and economically sound.

If skilled and organized laborers wished to have a voluntary form of insurance which would furnish them out-of-work benefits without compelling them to engage in some crude labor outside of their trade, that arrangement might be accepted and moderately subsidized in lieu of any insurance guaranteeing crude labor in industries promoted by the State, and the State could establish this form of insurance for those who did not carry the other form of unemployment insurance.

I have already referred to the possibility of bringing some pressure to bear on our industrial system so as to cause it to make such readjustments as would tend to reduce the risks of unemployment. Besides offering to reduce the rate of unemployment tax to those who would reduce the risks of unemployment in their industries, the State might, instead of starting new businesses to utilize

the labor of unemployment, subsidize certain existing businesses out of the insurance funds so as to allow them to pay living wages and operate with the usual number of employees, when they might have closed if it were not for the subsidy. By both these methods employers could be put under some pressure to link up more seasonal occupations, such as coal and ice businesses, and give their workers employment summer and winter. Such adjustments would tend to put on the business heads of the Nation the task of reducing unemployment, and they are the people most able to solve the problem if we can offer them an incentive to do so.

COMPULSORY UNEMPLOYMENT INSURANCE.

Possibly compulsory unemployment insurance for casual laborers is impossible, but if the opportunity for unemployment insurance was universal to casual laborers it would create a rather strong moral presumption against the man who refused to take advantage of it, and a certain stigma, such as belongs to vagrants, would tend to attach to him, and people who did not carry cards which indicated their standing in this regard would be at a disadvantage in getting employment both from employers and from employment bureaus, and if they were charged with vagrancy or with any form of misdemeanor the fact that they made no effort to insure themselves employment would also operate against them. Those who would not avail themselves of unemployment insurance would be entitled to suffer some such disadvantages. Certain fixed fees or assessments could be collected from them without any effort being made to have those fees based on the amount of their earnings, and then there would be no need of trying to keep track of their earnings. If these men moved about from place to place over the country they could have their standing transferred from the bureau where they were last registered to the bureau in their new location if we had a national chain of employment bureaus.

I would like to say a few words about the advisability of trying to bring some pressure upon casual laborers to practically compel them to fall in with such a system as this. As I stood watching the hundreds of men who applied for free meals and lodgings at the municipal lodging house of Chicago during the conference, I noted that very many of these men were able-bodied and intelligent young Americans, and I inquired from the officers of the municipal lodging house whether many of these men had dependents to support, or whether most of them were unattached single men, and they give it as their impression that the large majority of them were unattached single men. My own observation and the records in connection with our free lodgings and our employment bureau in Kansas City indicate that a large majority of the casual laborers are single, unattached men. Out of 2,008 unemployed men of the casual-labor class who were personally interviewed in February, 1911, by an investigator of the board of public welfare, it appeared that 11.30 per cent were married men having families, 75 per cent of which were in the old country, leaving only 2.8 per cent of the total number of unemployed men interviewed who had families in this country to be supported. It is a well-known fact to all workers who deal with this class of men that they periodically drift into the city with anywhere from \$25 to \$200 in their pockets, which they "blow in" for liquor and other forms of dissipation and return to work only when their funds are exhausted. Crude camp life, with none of the refining influences of home, and the saloons and cheap lodging houses of the city are responsible for many of the failings of these men; but these are the men who constitute the really pressing problem of unemployment in the cities, and I have only adduced these general observations about them to prove that it would not work any undue hardship upon them to place as much pressure as possible upon them to devote some of their earnings to making a provision for seasons of unemployment.

LABOR COLONIES.

Although no reference was made to the commercially unemployable people at the Chicago conference, yet until we reach a comparatively ideal state of society any complete scheme for dealing with unemployment needs some machinery for dealing with the backward and incompetent people who are really incapable of full self-support, especially under competitive conditions, and the other class of people who are criminally lazy or really unwilling to work, although this class is comparatively small. For the incompetent and defective classes there should be voluntary labor colonies or colonies with only a mild

degree of restraint and supervision, and for the last class of vagrants or criminally lazy people there should be compulsory labor colonies. This is not the place to elaborate upon the methods and uses of labor colonies, but I have merely mentioned them to complete the outline of a set of measures for dealing with unemployment.

Commissioner GARRETSON. If I caught your idea, it is virtually a plan whereby an agency, either governmental or otherwise, is required to furnish the necessary money to provide a living if the earnings do not do it. That is the plan that your ideas would resolve themselves into in their entirety, would they not?

Mr. HALBERT. But instead of caring for these people by charity, they should be made as nearly self-supporting as possible.

Commissioner GARRETSON. But assuming for the moment that your idea would produce an ideal state, if that is truly good, would it not be better if the Government assumed all forms of activity, took all the revenue therefrom, and returned the share to the worker, whether in wages or dividends, than to go only part way?

Mr. HALBERT. I get your idea.

Commissioner GARRETSON. If we are going to assume that form of the settlement of these questions, we might just as well take hook, line, and sinker. What I want to get at is, if what you have suggested is good, would not the other be better?

Mr. HALBERT. I would not advocate the proposition that we should junk the present industrial system and establish a socialistic system without trying to see first whether the present industrial system would not carry the burden that belonged to it.

Commissioner GARRETSON. In the real working out would not the plan you suggest bear precisely the same relation to what I assume you describe as the socialistic system, as a minimum wage bears to a full wage? In other words, this is a step in the other direction?

Mr. HALBERT. Yes.

Commissioner GARRETSON. And if it worked out fairly successfully, would it not be a proof that the whole program which you have referred to as socialistic would be still more desirable?

Mr. HALBERT. I think so; but in saying that I think that for the purpose, at any rate, of the education of the public it is better to try those plans, because the public will not believe the present system to be a failure on those things without at least giving it a trial.

Commissioner GARRETSON. You are going to let the industrial system stand in the relation that the Interstate Commerce Commission or congressional action stands with reference to railway labor questions. That is, they are the dog on which to try new things. Bear in mind I am speaking from experience.

Mr. HALBERT. I think the condition of labor, especially unskilled, unemployed, and destitute labor, would be improved by this process. I do not think it would be idle. You speak about making them a dog upon which to experiment. I do not see how they would be injured. If they would be injured I would not be in favor of it.

Commissioner GARRETSON. What appealed to me was this: The remedies all seem to me to savor strongly of the social revolution theory, while the means of carrying it out was reformatory, in a sense. If the laborer is entitled to the due proportion of that which he produces, why not put it on that basis, if this is only a step in that direction; if he is deprived of that by the present industrial system, why should not the other system be tried? Bear in mind that I am not committing myself to any form of belief. I want to get yours.

Mr. HALBERT. Yes; I understand.

Commissioner GARRETSON. If the object is to give the remedies that are said to exist in the revolution theory, why stop halfway with the reformatory measures?

Commissioner WEINSTOCK. When you say "revolution theory" do you mean socialism?

Commissioner GARRETSON. I am speaking of the terms that are ordinarily employed as a means to blot out the present system, by revolution—the social idea.

Commissioner WEINSTOCK. You practically have reference to socialism?

Commissioner GARRETSON. Yes. I am simply leaving out that word. Where I used it, I am simply borrowing it from the speaker. It appealed to me that

if you are going to use that as a remedy it might be better to apply it in larger doses.

Mr. HALBERT. Even if I agreed to that, I think the administrative difficulties of making an industrial system are so great that you would have to come at it through some such process as this, by which you acquire both the experience and the data on which you can do anything first. I do not believe you could frame a system such as you speak of without some such intermediate process, at any rate.

Commissioner WEINSTOCK. You mean that this is simply laying the pipes in the foundations for socialism?

Mr. HALBERT. Not necessarily. I believe that Government regulation is a different thing from Government ownership, and I advocate Government regulation. We have at the present time, at least by State law, attempted economic regulation, and socialism is still a different thing; and if economic regulation has been a failure, as I have contended before you that it is—and that is for you to investigate and find out—and Government regulation might be better, and it would offer less difficulty of realization than such a general socialistic movement as you speak of, although I do not think the commission should be at all afraid to ask any such fundamental question, whether they want to have an entirely new system or not.

Commissioner O'CONNELL. You would not want to jump out of the present industrial system into a socialistic system?

Mr. HALBERT. I do not think it could be done.

Commissioner O'CONNELL. You would not want to do it even if it could be done?

Mr. HALBERT. No.

Commissioner WEINSTOCK. Is it your idea that socialism is all you have outlined, with plus of ownership?

Mr. HALBERT. Oh, socialism is more than this.

Commissioner WEINSTOCK. That is, you could not have socialism without having this, but you could have this without having socialism?

Mr. HALBERT. Yes.

The ACTING CHAIRMAN. Are there any other speakers who desire to be heard?

STATEMENT OF MR. JAMES H. BOYD.

Mr. BOYD. Mr. Chairman and gentlemen of the commission, I wish to bring to your attention a matter connected with legislation, both State and National, affecting workmen's-compensation acts.

The ACTING CHAIRMAN. Will you please state your experience in connection with these matters?

Mr. BOYD. I am ex-chairman of the Employers' Liability Commission of Ohio and a member of the committee on organization of the International Congress of Social Insurance.

By way of introduction I wish to describe briefly the manner in which perhaps the most extensive legislation which has been put in operation, which involves compulsory State insurance—compulsory social insurance, if you like—in the line of workmen's compensation, is being carried into effect.

In 1910 Gov. Harmon appointed a commission to investigate the matter of compulsory workmen's compensation, and I, as chairman of that commission, conducted 37 public hearings in different parts of the State.

Now, the reason I wish to discuss this subject in an introductory way is to illustrate how, to a limited extent at any rate, it has been worked out by practical legislation and has produced a remedy for some of the difficulties which the previous speaker has spoken. Then I wish to call attention to the fact that it is in consonance with the evolution of society, as depicted by the work of Sumner on the Folkways, Customs, and Laws of Organized Society, the evolution of organized society.

We can neither see the beginning of organized society nor can we predict immediately what the future of organized society will be in respect to its regulation of the social and economic conditions of that society. So in attacking that problem in our State, where we have 5,000,000 people and 1,000,000 workmen to consider, 4,000,000 people who are either workmen or dependents, we conducted 37 public hearings, in which the representatives of labor unions and the employers' associations and their attorneys took part, for two purposes. The first purpose was to educate the public as to what the legislation contemplated, and in the second place to bring out the precise contention of the em-

ployers on the one hand and the employees and their representatives on the other hand.

After we had conducted the 37 hearings—at Youngstown, Dayton, Cincinnati, Cleveland, Columbus, and Toledo, and were ready to report the law to the legislature, there were left two contentions. One contention was—and that was the contention of the labor organizations—that they retain the right to accept the compensation provided in the act or to sue the employer, as had been done before.

The contention of the employer was that the employee should contribute directly to this fund some substantial part, possibly one-fifth or one-sixth or one-seventh, but some substantial part of the fund, in order that he might have an interest in the fund by way of administration and protection of the integrity of the fund.

It was first established by investigation that the old common-law remedy must be abandoned; because in making a survey of the economic effect of the German workmen's compensation act upon society and of our liability laws upon society, as well as the systems in other foreign countries, we learned that the natural hazard of a business, no matter how careful the State has been, no matter how careful the employer has been, no matter how careful the employee has been, is such that 54 per cent of the accidents which occur are due to the unavoidable risks of the business, and 46 per cent of the accidents are divided between direct carelessness of the employer or his agents or superintendents, and the negligence of the employee and his fellow servants, and the acts of God. That was demonstrated with sufficient clearness to the legislature so that they took the position, after some discussion before the committees, of abandoning the common-law action and are enstituting a new remedy, based upon the natural right of the workmen and their dependents to have a new remedy established and recognized by the State, for their mutual protection; not that the employee should pay, but that a premium should be collected from the employer, as import duties are collected and charged up to the cost of the business and paid by the consumers, 80 per cent of whom are employees or their dependents.

When the act was finally completed two years ago, or in the last legislature, the contention of the employers that the employees should contribute was eliminated. The contention that the employee should have the right to sue was eliminated to such an extent that in 16,000 accident cases that have been adjusted there have been three suits, in only one of which the workman obtained a judgment, although his employer had paid the premium into the firm. But that is yet subject to appeal to the United States Circuit Court of Appeals, Cleveland circuit. So that now, beginning with the 1st of January, we shall have 1,000,000 workmen, not under the direct protection of a workmen's compensation act, as is the case where you have an optional workmen's compensation act, as in Kansas or Wisconsin, but where every workman where five or more are employed, it makes no difference whether the workman is employed in a bank or in a firm or in a factory, will get the compensation for an injury directly from the State insurance fund; and in one week 25 employers employing 50,000 workmen, with a pay roll of \$25,000,000, including the National Cash Register Co., referred to by Dr. Devine, the Willis-Overland Automobile Co., of Toledo, where I live, with 6,700 employees, went in under the terms of the act.

Commissioner BALLARD. Voluntarily?

Mr. BOYD. The act has always been compulsory as far as the employer was concerned, except in very limited cases, so limited that in 16,000 accidents there have been only three lawsuits.

Commissioner WEINSTOCK. You say it is compulsory, and yet you say these men came in under the act. Are they not in under it automatically?

Mr. BOYD. They are automatically under the act, but a man is automatically under the act not to break into a house; yet he may break into a house nevertheless. What I mean is that the premiums are paid into the fund, so that the workman who may be injured will get his compensation from that fund direct.

Commissioner WEINSTOCK. The situation is not clear to me. May I be permitted to ask some questions so that I may get a clear idea?

Mr. BOYD. Surely.

Commissioner WEINSTOCK. In the first place I should like to understand whether in Ohio you have compulsory compensation or voluntary compensation?

Mr. BOYD. They never had a voluntary compensation act.

Commissioner WEINSTOCK. It is compulsory?

Mr. BOYD. It is only a question as to the degree of the penalty for failure to pay the premium.

Commissioner WEINSTOCK. Does the State monopolize the casualty-insurance field?

Mr. BOYD. Yes.

Commissioner WEINSTOCK. Private casualty insurance companies are not permitted to operate there?

Mr. BOYD. No, sir.

Commissioner WEINSTOCK. Then, every employer pays a contribution into this fund, I presume, and out of this fund the State pays compensation to workmen?

Mr. BOYD. Yes. Let us suppose the employer does not pay the premium. Then suppose a workman in a place of employment where five or more are employed is injured. He makes application to the State and the State pays him. The statute gives a judgment for the amount of the award plus 50 per cent, the same as for unpaid taxes, and the 50 per cent is added in the case of the employer who has not paid the premium.

Commissioner GARRETSON. The judgment is against the employer?

Mr. BOYD. Yes. It is in the nature of a penalty for not having complied with the law of the State. Now, the compensation there is based on 66 $\frac{2}{3}$ per cent of the loss of earning power due to the accident.

Prof. Sumner's work on the Folkways, Customs, and Laws, to which I have already referred, represents a lifetime's work, and his observations in ethnology, sociology, and economics and this legislation is based upon the collective sum of human knowledge in reference to this subject. This work of Prof. Sumner treats of insurance against accident, insurance against sickness, against old age, against being out of work, mothers' pensions, as all being on the same economic and legal basis, the recognition of a natural right on the part of the people of the State to demand that the State give them a permanent scheme of mutual protection for which they themselves pay at the minimum cost.

The report of the State of Washington shows that they conduct the same kind of insurance as Ohio, exclusive of compulsory industrial State insurance. The figures there are that they can conduct their business at a cost of 8.2 per cent of the total amount paid in, and the best that liability insurance has ever done is in the operation of the British act during the year 1909, where the 33 liability insurance companies furnished all the insurance that there was furnished in the protection of 13,000,000 employees at 32 $\frac{1}{2}$ per cent. Then there was left the administration, the doctor bills, hospital bills, funerals, and the litigation left under the British act of which there is none left under the Ohio act.

If the board denies compensation on the ground that the workman was not in the due course of his employment when he was injured, he can sue the board but not his employers.

Commissioner GARRETSON. What is the cost of administration?

Mr. BOYD. Twelve and one-half per cent.

Commissioner BALLARD. In the State of Washington is any of the cost paid by the State itself where the cost is 8.2 per cent?

Mr. BOYD. Let us get it into your head right. We will write down all the premiums paid by the employer. We will write down all the funds appropriated by the State. Then we will give a statement at the end of the year, figuring up the absolute cost of administration, and that is 8.2 per cent of all the funds paid in both by the State and by the employers.

Here is another fundamental point in that connection: In the State of Ohio it is provided in the act that the State pay the cost of administration for two reasons. One is that there is an economic base, because we prevent one-third of the litigation of the State. The State is bound to provide jurors and to provide sheriffs to serve subpoenas and clerks of the court. We reduce that cost one-third and substitute in the place of it the cost of the administration of this act.

But that is not the main reason. The main reason why the State should pay the cost of the administration is so that the cost of administering that fund can never become mingled with the cost of the actual compensation; because it is something that might be abused, and if it is abused, then the cost of administration can never be confused with any other fund. It will always be possible to know exactly what the percentage is, and the outs can ask why, if the State of Washington can administer it for 8.2 per cent, it can not also be done in Ohio for that?

Commissioner WEINSTOCK. Is there not another reason, which is that the worker shall receive 100 cents on the dollar?

Mr. BOYD. Sure, to eliminate the waste. That is a fundamental proposition. Now, as I have stated, we have in the State of Ohio a million workmen who are not indirectly under the protection of the act but directly under the protection of the act.

The ACTING CHAIRMAN. And the women and children?

Mr. BOYD. And all their dependents, of course. Of course industrial insurance is not to protect me for losing my arm. It is so that those dependents on the workman's arm shall not suffer by virtue of that accident, or be prevented from attaining the normal ability to support themselves, and so that the older dependents shall not become a charge on public charity.

Commissioner WEINSTOCK. If the compensation act furnishes a compensation equivalent to 65 per cent of the injured worker's earnings, is not the injured worker really contributing 35 per cent?

Mr. BOYD. That is a technical way of stating how much he furnishes. Of course, here is a carpenter who works 118 days or 200 days, or possibly 300 days, but he gets 66½ per cent of his weekly wage for six years.

Commissioner WEINSTOCK. Sixty-six and two-thirds per cent of his wages for the 300 days?

Mr. BOYD. No; it is like this: His average weekly wage, we will say, is \$18. Two-thirds of that is \$12. He gets \$12 a week for six times 52 weeks. That will be six years. That would make about \$3,750.

Commissioner BALLARD. He gets it by the week, not in a lump sum, does he not?

Mr. BOYD. He gets it by the week.

Commissioner WEINSTOCK. If it is shown that the carpenter has averaged, say, 220 days' work a year for the past two years, is his compensation based on his earnings for 200 days or for 300 days?

Mr. BOYD. No; based upon his average weekly earnings.

Commissioner WEINSTOCK. Fifty-two weeks in the year?

Mr. BOYD. Yes.

Commissioner WEINSTOCK. His unemployment is not considered?

Mr. BOYD. No, sir.

Commissioner WEINSTOCK. Is there not a limit to that? Suppose he has only worked one week in the whole year; then what?

Mr. BOYD. Then it is up to the board to determine what his average weekly earnings are.

Commissioner O'CONNELL. The board does not deal at all with a man's unemployment?

Commissioner BALLARD. It supposes that he is employed?

Mr. BOYD. Yes.

Commissioner O'CONNELL. Based on his rate of wages if he had worked?

Mr. BOYD. Yes.

Commissioner BALLARD. He gets this compensation only if he gets hurt or the accident occurs while he is at work in the employment?

Mr. BOYD. In the due course of his employment.

Commissioner BALLARD. That protects him if he gets hurt in the factory?

Mr. BOYD. The premium that the employer pays is based upon his pay roll.

Commissioner BALLARD. That takes care of the man for six years if he is hurt while at work; but suppose he is hurt when he is 3 feet outside of the fence instead of 3 feet inside of the fence?

Mr. BOYD. That has nothing to do with it, then.

Commissioner BALLARD. He does not get any pension at all?

Mr. BOYD. No, sir.

Commissioner BALLARD. Ought he not to be protected in one case as well as in the other?

Mr. BOYD. No, sir.

Commissioner BALLARD. Should the State neglect him entirely if he is hurt while helping his wife put up a curtain?

Mr. BOYD. In any city they take him to a hospital and take care of him there until he is straightened out. If he can pay, he pays, and if not, then he does not pay. You can not provide for a case like that in an act of this sort—in a scheme of workmen's compensation based upon placing a charge upon the consumer who buys the product which is produced. The fundamental point is that you classify your employment with regard to the degree of hazard.

Commissioner BALLARD. The different employments pay different rates?

Mr. BOYD. Yes. In the State of Washington they have 48 classes. In the State of Ohio we have a great many more classes.

Commissioner DELANO. How many States are there besides Washington and Ohio that have workmen's compensation laws?

Mr. BOYD. Twenty-three States now have workmen's compensation acts, including the State of New York. The State of Washington and the State of Ohio have compulsory State-insurance acts, which are exclusive. The States of West Virginia, Oregon, Massachusetts, California, and one or two others provide a State-insurance fund, but the acts are obsolete in various ways. They mark a transitory stage between the English compensation act and a law like the Ohio and Washington act. In my opinion they will all be compulsory, will all have compulsory insurance acts like Washington and Ohio inside of five or six years.

Commissioner BALLARD. Are not the Washington and Ohio acts very much alike?

Mr. BOYD. Yes. The law has been in operation two years, only we did not make it absolutely compulsory on the employer at the start, because we took away all the defenses of the employer gradually, and that was enough. Then this last year we drove in the last wedge and took them all away to the extent of his property.

Commissioner GARRETSON. You smoked him in?

Mr. BOYD. We drove him in and then we shut the door. That is the only way in which it could be done.

Commissioner GARRETSON. I agree with you.

Mr. BOYD. The interesting thing about it is that 999 employers out of 1,000 in Ohio are very much delighted with it, whereas six months ago they thought it was a piece of penalism and revenge against the employer.

Commissioner O'CONNELL. How does your law compare with New York's?

Mr. BOYD. I have just got it and have it in my pocket. I do not know the details of it. I have not read the New York act.

Commissioner O'CONNELL. Is not that the extreme of legislation we have had so far?

Mr. BOYD. I do not understand so.

Commissioner WEINSTOCK. Extreme in favor of the workman.

Mr. BOYD. The New York act does not provide so large compensation as the Ohio act.

Commissioner O'CONNELL. That is not always an essential. The principle involved is the important thing.

Commissioner GARRETSON. How does the time compare?

Mr. BOYD. I have not read the act.

Commissioner GARRETSON. Time and amounts may be in opposition to each other and produce a more desirable result with a low rate and a long time than a high rate and a short time.

Mr. BOYD. I could not give you the details of the New York act.

Commissioner BALLARD. Has Massachusetts a good act?

Mr. BOYD. I would not say it is a good act or a bad act. It is a magnificent act for the insurance companies. It provides compensation to everybody, but the employer must furnish it, and they do not provide a definite State insurance fund.

The employer has got to insure himself. He must go to a liability or mutual insurance company and insure.

Commissioner O'CONNELL. They have a board?

Mr. BOYD. Yes.

Commissioner O'CONNELL. An adjusting board?

Mr. BOYD. Yes.

Commissioner O'CONNELL. That board must determine whether the settlement between the employer and the employee is a satisfactory one?

Mr. BOYD. Yes.

Commissioner O'CONNELL. And the Massachusetts board has turned down thousands of cases where the insurance companies have made full settlement.

Mr. BOYD. Yes. The consumer has got to pay for that expensive way of administering. Some of the gentlemen down in Massachusetts may perhaps claim that is the best way to do it, but it is up to you people to say whether it is or not.

Commissioner O'CONNELL. I heard a Massachusetts man and an Ohio man arguing the question, and the Massachusetts man told the Ohio man he had the worst failure of a compensation law that they had in the United States.

Mr. BOYD. That is all right. Mr. Tecumseh Sherman has gone all over this country saying that it is the rottenest act in the world. That is all right. He has a right to his opinion, but as long as it pleases most of the employers and 5,000,000 people in the State who are employees or the dependents of employees, we do not care what Tecumseh Sherman says about it.

Commissioner O'CONNELL. I do not see why, but he made the bald statement.

Mr. BOYD. Yes; but bald statements can be made easily. This is the main thing I want to call your attention to. The Federal act drafted by the Federal Workmen's Compensation Commission, of which Senator Sutherland is chairman, passed the Senate and got into the House, and it is in the committee somewhere. Now, we have these 23 States that have workmen compensation acts in different forms, and there is a conflict between the jurisdiction of the different States, and they are waiting for what this Federal act is going to be, because the interstate carriers, of course, do not care to come in under a State act if there is going to be a Federal act. It will not require very much time for this commission to devote a little attention to this, and appoint one or two men as a committee to cooperate with the President and Senator Sutherland and the different gentlemen who have charge of this Federal act and hasten the passage of it. Where a man gets hurt on an interstate railroad, he wants to get the protection of the State act. The railroad companies do not want him to have the protection of the State act. They would have it under a Federal act, or go back under the employers' liability act of 1908. You eliminate all that expense and all that contention the moment that act goes through. Then these State acts will all work out much faster, and you can render a great service to this country in hastening that, if you only hasten it six months.

Commissioner WEINSTOCK. Your suggestion would be that this commission at its earliest opportunity then issue a recommendation to Congress that they shall pass a Federal compensation act?

Mr. BOYD. Yes; and use all your force to get it through as soon as possible, in the best possible shape, whatever that is. By the way, I think that act ought to cover not only railroads, but interstate traffic on the lakes, on the rivers, and coastwise traffic.

Commissioner WEINSTOCK. How about the employees of the Federal Government itself?

Mr. BOYD. They are already protected by a bill.

Commissioner WEINSTOCK. They are already protected?

Mr. BOYD. Yes.

Commissioner WEINSTOCK. That is news to me.

Mr. BOYD. Under a separate act.

Commissioner WEINSTOCK. Has that been passed?

Mr. BOYD. Yes; and it is in operation.

Commissioner LENNON. It is not considered a very excellent act.

Commissioner GARRETSON. It is not an exact duplicate of this act, but there is a workmen's compensation act in existence as applied to Federal employees.

Commissioner WEINSTOCK. I was told by a gentleman connected with one of the departments that if he should be injured in the course of his employment, injured in Government service, he would have no remedy.

Mr. BOYD. He is mistaken.

There is no question about the value of a service of the kind I have indicated, in doing all you can to expedite the passage of a Federal workmen's compensation act, to apply to interstate railroad and other interstate employees. You could delegate this to one or two members of this commission to watch it, follow it, and to render a great service to this country.

Of course, we are to have an international congress on social insurance, to which will be invited, under the authority of the Government, the representatives of Germany, France, England, and other countries, and I think you ought to devote a little attention to the nature of the program that that organization will get up, because it will have the widest influence and the greatest effect upon all this kind of legislation.

There are several of us who have been invited over into Canada to assist in advising—if I may use the word—the Ontario Government in framing their act. Of course, there are no constitutional difficulties involved in framing an act in the Dominion of Canada or in any foreign countries. The difficulty in this country should be brought out in that program—that is, that in these industrial or social insurance acts, these constitutional questions have to be met, and that these acts must be so drawn as to come within the constitutional

limitation, for example, the taking of property without due process of law, and the equal protection of the law. For example, in Montana the act provides that after the employer has paid his taxes on the coal produced and the workmen had paid their 1 per cent of their wages into the fund, that permitted the workmen to elect to take the compensation or to sue the employer as heretofore. That insurance act was held to be constitutional all the way through, except the one provision that permitted the workmen to elect to sue, and the court held that that was not equal protection of the law.

Commissioner WEINSTOCK. They gave him two options?

Mr. BOYD. They gave him two ways of getting his compensation. That simply multiplied the liability of an individual employer.

Commissioner WEINSTOCK. In what State was that?

Mr. BOYD. That was in Montana.

Commissioner WEINSTOCK. In California the law gives the workman the right to sue if the employer has been willfully negligent?

Mr. BOYD. Yes.

Commissioner WEINSTOCK. He has two remedies there.

Mr. BOYD. That is another difficult proposition. That is in our Ohio act, too, but it ought to be out of the act, because if an employer willfully injures a person it is either a misdemeanor or a felony; and, if he violates the statute of the species of legislation that has to do with the regulation of workshops and factories, that is a matter of penalizing under that provision. It should not be brought into a workman's compensation act to complicate the administration of that act and to vitiate the conception of the act. It should be kept outside of the act, but we could not quite keep it all out.

But to illustrate the way it actually works, there are 5,000,000 people in the State of Ohio who are getting the benefits of it, and that is the reason why I have recited at length, as I have, this description of our work in Ohio. We got all the contentions that the American Federation of Labor was fighting for—Mr. Gompers and all the rest of them. Mr. Gompers, at first, was a strong advocate of retaining the right to sue if the workman desired to sue, but he has ceased to fight on that proposition. That proposition made a great deal of trouble. Then, the employers said, "We will not do anything unless you workmen contribute to the fund." We got rid of both of those contentions—with that slight exception—and, a little later, we will just pull that out and stick it in in another place.

Commissioner GARRETSON. You made a recommendation a little while ago that this commission should use its very best influence to secure the passage of the workmen's compensation act.

Mr. BOYD. That is the interstate act?

Commissioner GARRETSON. In Congress.

Mr. BOYD. Yes.

Commissioner GARRETSON. Are you conversant with the attitude of the labor organizations whose sole membership comes under the provision of that act throughout this country?

Mr. BOYD. If it is represented by Mr. Sabath, I do.

Commissioner GARRETSON. Does Mr. Sabath hold a license to speak for any of these organizations?

Mr. BOYD. No.

Commissioner GARRETSON. I am speaking of the four railway brotherhoods.

Mr. BOYD. Yes.

Commissioner GARRETSON. If he had that right, it is canceled?

Mr. BOYD. He ought to cancel it right away.

Commissioner GARRETSON. I will say this to you for these four brotherhoods. For instance, these brotherhoods have representatives in Washington.

Mr. BOYD. Yes.

Commissioner GARRETSON. I have a legislative representative here.

Mr. BOYD. Yes.

Commissioner GARRETSON. And each of the other three organizations has a representative.

Mr. BOYD. Yes.

Commissioner GARRETSON. Mr. O'Connell, your representative is commending the act as it stands, is he not?

Commissioner O'CONNELL. Not now.

Commissioner GARRETSON. One of them commends it absolutely as it is. A second one demands its change to the elective plan, with the power of election, and will back it in that form. The other two are absolutely opposed to

it. Now, would not we three be in an inconsistent position here to commend the passage of that act, as members of this commission, and then as individuals go and oppose it along the lines that I have named?

Mr. BOYD. Of course, we had you fellows out there in Ohio.

Commissioner GARRETSON. I am speaking for the gentlemen on this side of the table, Mr. Lennon, Mr. O'Connell, and myself. That is what we are up against.

Mr. BOYD. Yes; we had them, too.

Commissioner GARRETSON. You only had the State representatives of our organizations.

Mr. BOYD. Yes; but they communicated with Mr. Gompers and all those gentlemen.

Commissioner GARRETSON. I am speaking for the railway brotherhoods. Mr. Gompers does not speak for them.

Mr. BOYD. I know that; but you have your own organization in Cleveland.

Commissioner GARRETSON. That is the engineers. Our State organization is entirely separate from the national.

Mr. BOYD. But are not your State organizations members of the national organization?

Commissioner GARRETSON. Yes; but if the men in one State want compensation and the men in another State want liability, it is nothing uncommon to find a committee of my own organization fighting for liability in Arizona and fighting for compensation in Ohio.

Mr. BOYD. There are some places where you can never take away the right to sue for injury. New Mexico put that provision in her constitution.

Commissioner GARRETSON. Those are the things that they are up against.

Mr. BOYD. In my opinion, the Federal act should provide that every railroad should be in a class by itself, and the Interstate Commerce Commission can determine the hazard of that road from the statistics turned in, so that each road will pay a premium based on its experience, the same as we have different classes of employment in Ohio. I would have the act put each railroad in a class by itself. Then you can make a class of the interstate traffic upon the lakes. In just one storm we had fourteen vessels that went to the bottom with everybody on board.

Commissioner GARRETSON. I know; and the railroads themselves are in a devil of a storm. There are some that slaughter them by thousands, and there are others that do not.

Mr. BOYD. The fellow that is paying the big premium, he will be checked by that, will he not?

Commissioner GARRETSON. Yes; I guess he would be.

Mr. BOYD. I guess he would; and you have got the safety-appliance act behind them. If the plan that I am suggesting is followed out, then it will appear in the operating expenses, and each railroad will have to pay in accordance with the experience of the road.

Commissioner LENNON. We will all agree on these questions by and by.

The ACTING CHAIRMAN. The commission will now go into executive session. (At 3.35 o'clock p. m. the commission went into executive session.)

STATEMENT OF MR. CHARLES McCARTHY.

The CHAIRMAN. Prof. Commons has told us that we may hear from Mr. McCarthy, and I will ask you, Mr. McCarthy, to state in what way you have been connected with this work.

Mr. McCARTHY. As head of the Legislative Reference Bureau of Wisconsin, and I have been connected with all the work in Wisconsin in one way or another.

I have been for 13 years in charge of the bureau which has done all the drafting for Wisconsin. All the constructive work, every piece of it, has been under my charge in some degree. I have been the man who was connected with this whole thing in the University of Wisconsin. That is why Prof. Commons suggested that I come here and talk to you.

It is only a question of methods that I want to talk about. I do not want to go into all the subjects you have here.

We had this situation in Wisconsin: They had that reform movement in the State, headed by Mr. La Follette. It was a question of what should be done,

just the thing that you people are up against, and a question how they could do it, and we hit upon a way of working that thing, which might be useful to you here.

As you observed in talking to Mr. Leiserson, he is a trained man. He was one of my students and was one of Prof. Commons's students. We began training these men for different subjects. It is a long process, and we have trained the most of the men who have gone into that kind of work.

In the early days when an investigation was started like this they would bring in almost all kinds of testimony to get at the facts, and then that testimony would result in a great many volumes. You would not have anything left afterwards. You would not have any administrative work left, or else it would result in somebody drafting some law. The result would be that there would be nobody to carry out that law, and there would be books full of statutes, but no practical results.

Now, I want to impress upon you people the necessity for the constructive portion of the work. What Mr. Leiserson says is in line with what I will say. Mr. Leiserson told you not to begin to go over all this thing again. Get the consensus of what there is on the subject first. Get the reason why success has come in certain lines and why success has not come in other lines. Begin at once on that end, and begin drafting up your plans at once for your constructive work that is to come along in the future.

I believe that all the investigations of this sort in the past have made the mistake of not doing that, and because they have not done that the inevitable tendency of a body of this sort is to go off on this line and that one and that one, and then they begin to branch off each into other lines. They are all good, but you can not do them all. Can you not tie them up?

We believe in taking three, or four, or five, very fundamental things which will lead to something else afterwards, and we believe in tying them up first. We believe that the outlines should be pretty well worked out, that there should be an immediate program, a thing to do first, and a thing to do next, and then another thing beyond that, and then another place that is left in a vague stage of investigation. Now, you have got that problem before you. You have got to pick out what you want to do next. Obviously, there will have to be considerable investigation, but I believe if you make any mistakes it will be in the great mass of the investigation, rather than in tying it up as you go along, on some particular subject. For instance, on a workmen's compensation act in Wisconsin, if we draft a workmen's compensation act we never sit down and draft an act in a week or two weeks, nor would there be an investigation which would never end in an act, but the act would probably be constructed beginning the very first day that the committee would come together. That is, there would be certain general lines which they would lay down, and then ask a trained body of draftsmen, constructive workers, just the same as if we were going to build this building, we would call in architects to show us plans of some kind upon which you can work. So we have the machinery for going at that work. We have the legislative reference department at Madison, of which I have control and that has five attorneys in their department. Some of those men have been at this work very many years now. They are all trained under me. They are fellows who can take up all the different kinds of legislation upon any of these subjects, and make a rough draft and put it into shape so that you will have before you just exactly what comes up.

Now, you take your rough draft, distribute it around among your friends, or around on the outside, and then draft it over again. In that first draft there will be called in men who are experts in these particular lines. You have seen them here, like Leiserson. If you were working on some particular line of work, you would bring in Leiserson, and when he would come there he would probably have all the different kinds of acts upon that subject, and would have them analyzed. Then after you get Leiserson you get other fellows of that type. Then you outline it in a rough way. You say "I would like to see a sketch of that thing." Then the draftsman would put this into shape and you would talk it all over, and then if you wanted to investigate some facts about it, you would want some more experts. For instance, at the University of Wisconsin there may be an attorney who knows a great deal about some particular phase of the law, from the law school. There may be a chemist, there may be a man who knows tuberculosis in animals. All these men are brought in on this outline, and as this outline is made, it begins to expand as you go along. Then all the investigation you may be making will be heading toward that. If you come to a place where you determine that you do not

want to do it, and the public sentiment of the country is against it, and the committee do not want to present it, you can throw it all over, but meanwhile you are always working toward the plan of what you want to do.

Now, in reference to the different things that have gone into the platforms of our different political parties, I want to say that I do not belong to any political party, and neither do any of my colleagues. We do not join political parties. We want to be with whatever force comes along. That is what we want. All our people are that way.

Now, I say we gather that sort of scientific body of men around, and they sit down and they know just about what is coming up in the State, they know the great necessity for some particular piece of work, and they survey it off to get the proportions of it, and the emphasis, as it is laid out, and then they take up the particular things that they know the sentiment is going to concentrate upon, and then they follow that up. Or they lay that down for some other thing that comes along. For instance, in the session before last, one of my students discovered the first way of getting around the Constitution in the workmen's compensation act. We were eight years trying to do that. We were the first people who started in on that. I went over to Europe and our people went over and made an investigation of the industries in England and in Germany.

Commissioner WEINSTOCK. In speaking of the constitution, do you refer to the State or Federal Constitution?

Mr. MCCARTHY. Both. We would have to look over both. We have a planning department right in the State government, itself, and that planning department acts under all the other fellows. They do not interfere with the committee work on any particular subject, nor do they interfere with the legislature, but they are in just the same position as an architectural body. You bring in a body of architects and say "We think of putting a building on this square, and we have thought it out in an informal way, and we think it ought to cost \$3,000,000, and that it ought to be so and so. What plans have you got?" We take the plans and look them over and say "That will not do." We take that out, and then we say, "This little thing, you modify that." And then you begin eliminating and changing and do it over again. This process may be repeated 50 times. All of our great acts in our State have been worked out in that way. Take for instance the great industrial-commission act, which is after all based upon the suggestion of the German act. It is the German act. It came from Germany. We have searched the wide world for these things.

There is a new kind of law growing up in America. There is a new economic law, based upon the determination of economic facts rather than upon the precedents of the courts. It is eating its way gradually into our legal system in America. In Wisconsin all our great commissions are based upon that, but that is a thing that has been worked out in other countries. After all, where does your workmen's compensation act come from? It came to England and from Germany. The Wisconsin act has as much German stuff in it as it has English. These things are coming up in a crowded country like America. In this country these problems are coming up. The problem of unrest is coming up, because men are not able to get out on the land, and get at the minerals, and get the things of nature. They can not get them any more. They are crowded, and then comes your unrest. Other countries have been crowded. Other countries have had unrest. People have lived in cities, and have been on the verge of starvation. Other great countries have dealt with these conditions. Germany after a hundred years of warfare was reduced in population and impoverished in resources. Now she has a population of 67,000,000, and you can go from one end of the country to the other and you will see very good conditions indeed. Germany is a wonderful example to the rest of the world, as showing what a country can do. She is a country that is now importing foreign labor.

That has been done to a large extent by good planning. Bismarck did a great deal of that planning, and the men around him, Wagner and other university men were brought in by him, in that plan that he made at that time. So England at the present time is just simply imitating Germany. Lloyd George told me himself that he had constantly gone to Germany, that he had spent his summers in Frankfort, that he went there and studied the methods of the German Government. So from Germany these things are reaching out around the world.

You gentlemen have some plans. Much of it is perfectly obvious to you, such as safety and sanitation. You know the American sentiment, and the sentiment

of the manufacturers has reached that point, and as far as you are concerned, you do not need to put any emphasis on that. You know you can use these fellows. They will go on and put forth plans. So in the university school of the country you can use all kinds of people. You can use associations, and all kinds of things that come up. I have not got your budget before me, but I should say that for work of this sort fully one-third of your money would have to be expended in gathering together the models and expedients, administrative expedients from all over the world. How many things there are that Leiserson says they found out from other nations. You do not want to duplicate work that has already been done. You have not got the time.

Then you want to have your material so classified that you can get at it at once. You can not do it conveniently in any other way. The problem is too big. You want to take a particular subject to a particular man, and let him begin to construct something, on that particular thing. You want men who will take each one particular piece of legislation, and go to him and say "Will this work?" Go up to Mr. Dawson and say "Will this work?" Mr. Dawson goes to work, and by and by you have something that has been put in the shape of a law, and you can look it over and determine whether it is worth while or not.

You people have heard the talk about the courts all the way through. If when you get through you do not have legislation that is worth while, it will simply mean that the people will get behind the courts. You will strengthen the courts in the long run. The people will say, "Oh, well, the industrial commission investigated that thing, and they did not find anything, and there is nothing before Congress, or there is nothing worked out." Now, you can work things out if you begin that way from the beginning; but if you leave it all within the last three or four weeks of your work you will have nothing tied up at all.

When you do get anything into shape, get it out through the press, through the magazines, get the American people familiar with it, get them behind it. I take it you would not have been appointed as a commission upon industrial relations unless you were expected to have something to do outside of the District of Columbia, or outside of your very limited Federal authority. You have got to say something to the States about the great industrial conditions all around the country.

Now, there are expedients. Legislation is now getting to be a science. I had the honor of starting off at the first of this sort of thing in Wisconsin, and organizing this general plan at that time.

Now we are getting to a place where we know the kind of legislation that will make these expedients effective. We know the exact status of that sort of thing. When we drafted the industrial commission act, we knew that it was going to be successful. We knew it would go. Why? We knew it had gone. We knew all these elements in every part of the world. We knew that thing was going to be of great importance in the future, just the same as we have two or three other acts now under way, and have been working two or three years on them. Sometimes we work in Wisconsin five or six or seven years before it comes off. That does not mean on one piece of work, but there are different stages of it all along the line. I had a man on this land problem working a year and a half, and he will work on it probably a couple of years before he will get it into shape, but when it comes out it will be something that you can talk about.

Take the public-utilities act. I brought out the first public-utilities act there. We brought together 9,000 pieces of legislation from all over the world, which we used in framing that public-utilities act. Our people went everywhere, and when we got it into shape it was based upon the Sheffield act of England. It was the first public-utilities act in America. That was worth while doing, because then the court sustained things that it would not sustain previously. The business man has no kick on it, because it works in an elastic way, in harmony with the conditions of the times. It does not interfere in his business in a way that is burdensome to him. He feels that it is worth while.

We have done an awful lot of radical legislation in Wisconsin. It has been a very original place, so far as legislation is concerned. It has been a radical place. We have had three kinds of Republicans, two kinds of Democrats, and two big Socialist organizations. We have had bitter war. The labor unions up there have been Socialists and they have come into the legislature; and notwithstanding the fact that we have had some very severe, harsh men at the head of our affairs up there, among the politicians, still Wisconsin has gone right on and it has been building up something which has not destroyed capital, and which has built up the State. Let me say here about the State of

Wisconsin, you will find that it is prosperous, and that it is going forward, and that nothing has been destroyed, and that something has been done.

You can have the same planning from here, and if you have a little reference department similar to mine for the legislative expedients that have been successful; if you have the successful ones gathered here and the ones that have not been successful gathered here, so that you can see what has been done in various parts of the country, then you can choose the best among them, and you can frame something that will be worth while. We get all these bodies to work together. You can do the same thing. You can submit to them the different portions of your work and have some fellow getting that out day after day, drafting and putting into shape, so that at the end of your report you will not have 19 or 20 volumes, like your last Industrial Commission had, but you will have, we will say, five or six neatly drafted, solid, and sound pieces of legislation. Then you will find that those will lead to other things.

In a great work like that which is before you you are liable not to see the forest because of the trees. It is a question of preparation, a question of thinking it out.

In sitting and listening to you people I have not talked on this thing at all except to talk with John Commons a little bit. I have sat here and been listening to you and to the different people who have come up and talked before you, and I have put down here some things that I suggest to you now.

I am very sure that right here in the beginning you members of this National Industrial Commission will be interested in something about the Wisconsin Industrial Commission. What is the Wisconsin Industrial Commission when you come to look at it? The Wisconsin Industrial Commission is a new kind of court. They took out of the ordinary court all these things that the people were complaining about. It is a court, but it makes its findings upon economic facts which are found by experts who come there and who go on and examine the thing and make an order, and those facts are not reviewable. This morning you sat in the chamber of the United States Commerce Court, which will go out of existence at midnight to-morrow night. When President Taft advocated the establishment of that court I wrote to him and told him that court would not last, because it was an old common-law court; and when it had to deal with an economic fact it was without the necessary machinery to deal with it, and the day for that kind of thing is gone by. You can not deal with these economic facts by legislation, because they are so complex that the ordinary legislative body can not tell about a whole lot of things, because they do not know anything about it.

I am not talking against democracy; I am talking for democracy, because it is not democracy for a crowd of us to gather here and say, "Let us build this building, and some of you gentlemen bring some stones and some timber, and some of you bring a delegation of hod carriers." That is not democracy at all. Democracy is a lot of us coming together and determining first whether a building should be put up here, whether the representatives of the people are willing that it should be here, and then making suggestions in a general way and discussing all of them, and then getting some competent men to draw a set of plans, and sitting down and fighting over them and saying, "This window is all right, but that one will not do; and we want this thing this way and we want that thing that way." Then, perhaps after changing the plan a half dozen times, finally you bring out a structure that will stand up, and then your building inspector, the Supreme Court, at the other end of town, can not kick it over. Then you have some justice in your law.

Not only that, but this commission is a new element in law. It is a strengthening of the statute law of the people. The people's will is carried out. No longer is a man coming into court with a bleeding stump and saying, "I want justice; I want my day in court." You have got too many days in court. In the future the thing is not going to work that way. The weaker man will come before the commission and the commission will say, "We will look over your case, and if you have got a good case we will make a decision on it." And that decision will stand; and the burden of proof will be on the fellow opposed to the commission. The State is back of you in that. We have got to make decisions that are in conformity with economic facts. We have got to take account of conditions that are coming up. The determination must be reasonable, based on economic facts. If it is a fact in chemistry, H_2O is water; if it is a fact in mathematics, 2 and 2 make 4. At the bottom there are immutable facts, and the gathering of all these facts is necessary.

Now, to suggest something just for the purpose of talking about it—putting up an idea just for the sake of knocking it down—suppose that this commission here, after discussing the thing for a while, should wish to apply this Wisconsin Industrial Commission idea to the Federal Government? You would say, "Can we do it? How far can we do it?" Then you would bring in some of these experts and say to them, "See if you people can draft something into shape that will apply the idea of the Industrial Commission of Wisconsin to the Federal Government. See if you can do it." I do not know whether they can or not, but they will bring their plans together. They will get trained men to thinking about it. Up there in Wisconsin they had John Commons. They will ask constitutional lawyers to consider the constitutional questions, and by and by they will present to you a plan. You will look over the plan and you will probably want to change it here and there. You will want to go ahead and amend it and fix it up. If you do not want it at all, you will throw it out; but if you think there is an idea in it that can be applied in some way, you are beginning gradually to build up something by bringing in other people and going over it again, and finally you can present to the American people, as an orderly law, something which may result in some court like the Interstate Commerce Commission that will deal with great industrial questions; deal with sanitation, deal with all these questions of employment and things of that sort, which will in a way solve a hundred things. I say that and make a suggestion of that sort; I am just simply now putting it up to you, so that your minds are working right now on the question whether you want that or not. I offer it to you, and out of it there may grow a definite, concrete thing. We have a thing of that sort. Then, if you decide you want it, then we can explain it a little bit. If, by and by, after three or four weeks you decide that you do not want it at all, then throw it out and begin on something else.

Now, see the advantage of that for a minute. Many of the States do not want to lose their power on many of these things, and one State that goes ahead is often penalized because it is going ahead. The manufacturers feel that they are being penalized. We feel that in Wisconsin, because we are generally ahead there on these matters. Manufacturers say, "This is unfair. You are passing a child's-labor law for us, while over in Michigan they are canning peas with the labor of children 6 years of age," or something of that sort. Now, supposing that uniformity of legislation throughout the country might be a thing worth while. You can get uniformity by having this industrial commission. You can work out a model act. If you think the Wisconsin act is worth while but that it ought to be modified, then you can do that. Get some model act and recommend it to the States. Let the various commissioners get together every year and make rules which all the States can adopt. You can not make uniform legislation for all the country, because a legislature can not take a great big long act and go over it in relation to all the constitutional questions, and one legislature may meet in a couple of months and another legislature may not meet until next year. You can not get uniformity in that way, but you can get uniformity by rules similar to those rules which have been suggested by John Commons; and these other men can get together and they will make up rules, and then they are adopted throughout the country, and the business man gets away from the annoyance of that thing; and while you are making these rules and you are getting in suggestions from the manufacturers and from the laboring people and from the people in the street, and finally there is a proposition that is worth while. You make a standard for the whole country through organizations of that sort. It is not a hard thing to work out; it is not a hard constitutional thing to work out. Anyway, it is worth while to discuss the question whether a certain thing can go forward; and you get your men together, you get three or four men working on it until they see if you can work that out, whether it is an improvement or not, and talk to people about it.

Now, there is another field of work coming on. I think that will be a part of an immediate program to be thinking of, a tentative plan for the future. For instance, let us take this thing that we have all been talking of and thinking of. That is the workmen's compensation act. Everyone sees from the talk that the workmen's compensation act is a powerful reaction. The by-products of it are greater than the act itself. It has already started these people to preventing accidents. Never before did anything do so much to prevent accidents as this very thing. The cost of it made somebody sit up and take notice and get to work and try to prevent accidents. It has had a powerful effect. Everything ought to be judged by its by-products. Right here has come the

vague talk about men who have been sick, about occupational diseases, about a man who is hurt after he gets outdoors, and here comes the wonderful question of sickness insurance, following right along. A man may be killed by being hit in the head by a thief, or he may be killed by lead poisoning. Either way he gets killed he is dead. It is a part of the game, the same thing. Now, let us see. There is a fundamental thing. I was going to make the suggestion to you. We are doing this now, because I am trying to analyze those things which seem to me to be not particular pieces of legislation, but things which follow what has already been done, and things which have in them potentiality of other things. Now, take sickness insurance. There is a thing going over the old countries now, going over all the world, the idea that with ability shall come responsibility.

Now, here is a situation which exists in some cities in America, where up on a hill there will be a fine lot of residences, and right down below somewhere there are a lot of dirty tenements where there are all kinds of disease and everything else that is undesirable. The sons and daughters of the fellows on the hill never see what is going on down there, and there is typhoid fever raging there or something of that sort. When you get sickness insurance, and the manufacturer pays part of it, he is the powerful man in the community, and the State pays part of it and the employee pays part of it, and when that happens do you know what is going to occur? The manufacturer is going to say, "That is a nice thing to make me pay," when somebody down there gets typhoid fever from drinking bad water. But in the great working out of things, that manufacturer pretty soon gets busy to stop sickness in that place. You can talk sanitation, you can talk prevention, you can talk clean tenements and clean water, in a way that you could not before; and when he gets over his grouch, he finds that it is a great asset for him. Now, the State and city gets to work; and the duty of the city is to keep Mary Jones from being sick, instead of letting her get sick, and then sending a lot of bum doctors around to cure people after they are sick. I am talking about this now as an example of the kind of legislation that I would suggest that your committee take up, in working out a program, because this kind of legislation is loaded, because there are other things coming with it, and it follows along, and it is the next step forward.

Now, there is the question of sickness insurance. I wrote into a party platform in Wisconsin a sickness-insurance proposition. We have got the subject of sickness insurance under consideration, and are working on it. We put a bill into the last legislature. It was not a perfect bill, but it drew the fire of those who criticized the proposition, and by the next legislature we will have something, and by and by we will know how to perfect that.

We are searching throughout the world for those things which will be effective, and for ways to work them out within the constitutions of the State and of the country, and by and by we will have a piece of legislation that will stand up and be worth while.

Now, if you people have the patience, I am coming to some of the things. I am going to tie them up, and when I get through I am going to show you what I think is a part of the philosophy. I am saying these things, and while I am doing it you are criticizing me for saying them. You are saying, "Ought we to do this or ought we not to do it?" Anyway you are getting a kind of core upon which your minds are working. You are thinking one way or the other upon this thing, and it is necessary in the consideration of these things to start with an idea and then put your critical faculties at work on it, and thinking about that particular proposition, rather than spreading all over the field.

Now, let us come to another thing. Take housing. You have your existing conditions, and some of them are bad conditions; but do you know that in other countries there is a scheme by which a city will go out and buy up 30,000 acres of land for the purpose of putting houses on that land for working people. The city plans the houses, and puts up model houses, and then the city gives the workman a chance to pay for a house in small payments—in 70 or 80 years, if necessary—and that is one way to solve the question of housing for working people.

Then you are beginning to hit disease. There is a great thing in getting started on this kind of a proposition, because when you try to hit tuberculosis you will hit typhoid fever and pneumonia at the same time. When you are teaching people to open their windows and let in the sunlight you are getting so many other things at the same time, and with sickness insurance and hous-

ing you are hitting a lot of other things. On this question of housing which comes up, what shall we do with that? Shall there be model housing for the District of Columbia? Shall there be a model housing arrangement for the different cities? What constitutional provision is in the way of that sort of thing? Well, why can not it be done? What kind of a Constitution have we got, as Mr. Wilson said some time ago, unless we can go ahead and work things out and do the things that ought to be done? My theory is that the Constitution exists for some particular good, and it was not put there by the fathers for the purpose of stopping us from doing good things. If it were put there by the fathers for a good purpose, then we ought to find out how to use it to the limit. It is inconceivable that it shall be put there for any other purpose.

So there, you see, one thing follows another. There are these conditions of housing, and the life and death of the children coming up—questions of cleanliness—all the different things. The fellow that owns a little home of his own, the fellow whose children have a chance to grow up in health, that is the kind of a workman who is going to be content; and no civilization can be based upon any other thing but the intelligence of the people in the long run—in content and the ideals that go with it. I had a conversation with a manufacturer in Cologne, Germany. He was talking about the reasons why German manufacturers are successful, and he said, "The reason why manufacturers in Germany are now successful is this: We have a village here, and we say to a man, 'Come over into our village and we will give you 10 per cent on your old-age pension, 10 per cent on your sickness insurance, the city will put up a nice house for you, and we will give you so many years to pay for your house. We have a school here which will give you the best opportunities for your boy or girl to come up the line so that they can come to the top of the business. We are going to give you the opportunities so that you can marry, so that you can bring your children up in cleanliness, so that you may have a home, so that you may educate your children.'"

Now, in that condition of things the manufacturer gets intelligence. He gets the opposite thing from the negro slavery that used to exist in the South. He gets the opposite thing from that which exists in crowded tenements. What are the things that he gets on which prosperity is based? He gets prosperity and hope and happiness.

He gets skill plus intelligence, and that high grade of intelligence is the thing which puts Germany up and has brought it up all along the line; and no real prosperity can be on any other basis except that.

Now, I say these things all enter into the questions which must be considered. They are coming up all along the line. I was going to bring up the question of education. Gentlemen, you might as well do a great thing in this country; you might as well attack this great problem, because the whole of the emphasis of our educational system in America is wrong. We pile up the money for great colleges for the people who have it, we pile it into our high schools for the people who have it, and we do not put the money down there in the weakest link in the chain. We say we do it, and we put this money into it, and then we give it to guardians and trustees who, because they have pompous titles, because they are doctors of something or other, are supposed to know about education; and they do not know anything more about it than the Chinese mandarin who did the same thing and who put China in a whole long ago. Let us get at this question of legislation in its relation to these things.

Commissioner LENNON. Amen.

Mr. McCARTHY. There is no man who has fought for that more than I have. I organized the great university-extension department in Wisconsin, and I nearly killed myself doing it. I brought the first compulsory continuation schools to America. That is a system which they have in Germany. What is the system of the continuation school? It is that you can say to the fathers and mothers, "When your boy goes to work in the factory the manufacturer shall then give 10 hours a week of that boys' time for four years in order that the boy may learn." And what will he learn? Will he learn to be a fast man on a machine? No, sir. If you have a man who is merely fast on a machine, merely skilled on a machine or something of that sort, you are never going to attain the purpose of industrial education. What is industrial education? The purpose of it is the social factor, the things which open the door wide to opportunity. Now, I am talking about the most powerful influence that will cure most of these things. I came down on the train the other day with Mr. Steyer who owns Steyerville, out in Long Island. He said, "I came to this country a German boy 12 years of age, and when I was 16 years of age I went to work

at the brick trade." I said, "Mr. Steyer, how is it that you got to be a contractor and made all this money?" He said, "When I was a mason a man came to me and said, 'Say, I want you to be an assistant to me as foreman. I will teach you the blue-print part of this thing,' and he was as good as his word. He spent an hour every day teaching the use of the blue prints, and how to use the blue prints on a job"; and Mr. Steyer said to me, "That is the thing that has made me different from the ordinary bricklayer. I got an insight into the boss's game." Do you see? That is how he had a chance to come up the line.

Now, there is a thing that we are working for in the Wisconsin apprenticeship law, so that every boy and girl will be given an insight in a practical way, and will be given the opportunity to learn the things that it is necessary for them to know. That does not mean the establishment of some big trade school. It means putting the whole thing into a system controlled by the manufacturers and by the laboring men, as they do in Germany, because the pedagogue never has done it and can not do it. In Chicago, after 35 years of the school men trying to work out these problems, the result to-day is that there are 19,000 children in private commercial schools paying annual tuition fees of \$1,415,000. There are 17,700 children in the public high schools, and the city is paying \$1,114,000 for that work. That is, if you are able to give your boy Latin and Greek he can get that for nothing, but if your boy or girl has got to take hold and help out and get into industrial life, as nine out of ten of them have to do, then you have to pay an extra tax, in addition to paying your share of the taxes for the support of the public schools, and the other taxes that come up in our modern life to-day. That is what they have there. Our school system, gentlemen, is the wrong thing. You talk about employment, but you have got to get down to the question of the kind of material that you have to work with. We know that it pays to invest in better cattle and sheep, because the farm will pay better. We know that the manufacturer has to keep up his machinery, or else he goes back.

Now, if we to-day were standing on a mountain top and looking down over the country, and if we owned it all, if each one of us was a Bismarck, and if we were trying to build up a great and glorious civilization, we would begin by making every one of those human beings down there more efficient. Iron and steel do not do it. The human being does it. The prosperity of the country does it. We would look down there and say, "Every one of those people shall have a better place to live, and if necessary we will destroy the universities." I say "if necessary." It will not be necessary, but you would say, "We will go forward and develop the people, their strength and intelligence. Civilization must ultimately depend upon the growth of these people in their strength, upon giving them the opportunity so that they will grow in their strength and grow in their ideals, and so that their sons and daughters will go up the line. It is a shame to us that Germany can say that 54 per cent of the engineers in their country came up from the continuation schools, came up from below. In America our engineers come from the top, and the working man at the present time is on a dead level, and we have this problem of a shifting population, and there is nobody to take care of the training of the boys and girls that come along, to give them a start in life and make them efficient. That is one of the greatest crimes against society, and it is one of the things that we have got to remedy. I went up and talked before the manufacturers of Wisconsin. They said, "McCarthy, we stand for all you have done, but when you teach citizenship we will not stand for that. That is some of your socialistic ideas, and we can not stand for that." They said, "When you talk about sanitation and a place for them to live in and keeping down sickness and how to instruct the men in the factories to keep down accidents, that is good for everybody, that is practical stuff."

Now, the teaching of citizenship is not teaching it out of some little book, but it is struggling with these mighty problems that are before us and building up public opinion in order that this country may be rightly governed, in order that the children coming along in the future will have their eyes opened to what good government is, so that they will not be fooled by demagogues. Now, I am not leading you astray about this, because this industrial commission has the opportunity to take up insurance for sickness, housing, industrial education; all these things. You can say, "Here is the District of Columbia. We can try it out in the District of Columbia. We will put these things before the people as a program, which will bring equality of opportunity, health, strength,

and life; the strength to fight, the ability to go out and make their way, the improving of the stock in every way, and the opening of the doors of opportunity. Now, Mr. O'Connell, we talked about that matter of efficiency yesterday, and I made some statement and you jumped right down at me. When I talk about this matter of efficiency—I worked in a factory when I was young—I am not here as a mere theorist.

Commissioner O'CONNELL. I worked 20 years in a machine shop.

Mr. McCARTHY. I am not here to prove these things, but I am here to ask you people to study them. If I was going up against some other fellow, and he had a brief, I would want to study his brief. I would study his argument. You want to study the arguments about this efficiency thing. I have looked through it. I looked over what Taylor was doing. I talked with the men there. I saw infinite possibilities for wrong in it, but I also saw infinite possibilities for good, and think the working people are not studying some of the things. I think in his great machinery that Taylor is working out there, in the plans that he is now making for these people to come up the line, there are some parts of that thing that ought to be studied, because the country is going to meet it very soon, and if there are parts of it which are for the benefit of the laboring classes in America, then it is something that everybody ought to know about. It could be taught in your industrial education, if necessary.

You can not hide your head in the sand over a thing like that which is coming along. There are some things about that system, as I say, which contains great possibilities for wrong. This thing of introducing a system that makes eight or nine times as much product, it may work unfairly. I am not making that statement. It may be possible if the man has the speed, but it may force a man beyond the point where he ought to go. There may be a possibility of that, but there are other things in there that are well worth studying, as something for the future. I am convinced that there are a great many things of that sort approaching us.

Now, these things are not cure-alls. You talk about industrial unrest here. Was industrial unrest ever solved in the world anywhere? No. We are nearer to-day to a solution of it, and there is more hope to-day than there ever was in the history of the world. There is more hope from the very men now working in Germany on these things. You are going back to what Mr. Quick was talking about. You have got to go back there. You know that the question of the land back there in a country of this kind is a question that has got to be considered. When there is the drifting of people from place to place, because of the cost of living and all that sort of thing, when a country in 10 years has increased in population 20,000,000 people, and the food supply has actually decreased 10 per cent, when there is actually that much less to feed the extra 20,000,000 people, that means there is something wrong. That means that back yonder there was an enormous waste. It means that at the present time there are swamps which are undrained. It means that the Government ought to have some system like that which was suggested here about the Irish land system—a system to be used in taking care of the immigrants coming in here. Shall we say to the immigrant that he shall not stay in the cities? Shall we say to him, "If you come in, you shall go out on the land"? And if he goes out on the land, shall we furnish him some long time means for paying for it, some means for making improvements in order that he may be a producer as well as a consumer?

Then there are the marketing systems such as they have in Denmark and in various parts of Germany and Belgium and Ireland—great examples of efficiency in the marketing of produce. Over \$1,000,000 a week of the produce of Denmark goes directly into the markets of England. There is a great institution, a great wholesale society in England that does a business of \$800,000,000 a year, and it is buying food supplies directly from Denmark. Do you not think it may have something to do with the killing of industrial unrest if we can develop some of these things? I do not say how far back you may have to go. You may have to go back and begin with the child eventually. We may be doing very wrong things to-day in our economic policy. We may have overflowed our cities. We may be putting our hands into the pockets of the people in the cities in order to build up a condition of things that we thought was desirable. All of these things have got to be considered. Then look against the question of efficiency. A boy comes into my department. There is something the matter with him, but I do not know what is the matter. He is sick. I say, "What is the matter with you?" He says, "When I was 14 or 15 years of age I went to work in a copper mill, and there is something the matter

with my stomach. They had to operate on it. I can not work inside and I don't know what I am going to do. I have two sisters, and my mother is a widow and we have to struggle along." I had such a boy as that. I saw that he was a bright boy, and he told me he had passed a civil-service examination or something of that sort. What are we going to do with a boy of that kind? I know what ought to be done with him. I ought to have a chance to put him out on the land, in order that he may be of some service in the future. What means is there for doing anything like that? Australia has some means. Belgium has tried it. There are private industries in England, outside of London, where they are being transferred from one place to another, until the proper place is found for them, and our Government ought to have something of that sort. Well, there is something that you can consider.

You were talking about the glass-bottle blowers and about their industry, which was being driven out of existence by machinery. Do you not think it ought to be the duty of the State to come and take the glass-bottle blowers, whose industry has been destroyed, and give them some other opportunity? Do you not think that where an industry is going to pieces there ought to be something done to educate the people in that industry, so that they may meet the changed conditions? You know how the linotype put the printer out of business, and the owners of printing establishments had to set up linotypes to teach their men the use of them. So I say the Government ought to have some system of industrial education to take care of these men. You know what happened when the nigger machine came along and put the lathers out of business. Men 40 years of age had to send their children back into the factories and their hopes were destroyed. Now, I say it is the duty of the State, in its industrial education, to teach those people the use of new machines and to give them new opportunities. I say that all comes into the field of industrial education—the building up of the efficiency strength of the man and making the most of him.

They talk about the German Army. We do not want any German Army here, but there is one thing that the German Army does, and that is to give the men in it the splendid physical development which makes them famous all over the world. They take a young man and keep him in the army two or three years. He is a tailor. He has always been cramped up and probably underfed, and they take him and give him plenty to eat and set him to building pontoon bridges, and he lives and works in the open air, and in three years he comes out splendidly developed and filled with energy. The weight of taxation for the maintenance of the German Army is paid for in the splendid physical specimens they turn out. In our educational system every boy and girl who goes to work between 14 and 18 years of age ought to be given an opportunity to develop some of that physical strength and ought to be looked after all along the line, in order that they may attain the highest efficiency and in order that our products in the future will be of some good. The great field of industrial education is to make your human product better in the future. Understand, there are many things that I am not going into. I am only putting down four or five propositions.

Commissioner LENNON. You are not letting anything get away from you.

Mr. MCCARTHY. I have only put down four or five of them; immigration, land, cost of living, those things I am not going into, because there are some things which you can very well put off. There is the Department of Agriculture and there are other departments that are working on those lines. You can touch it up in its relation to these other things, but you can very well confine your attention to a few things and not go into these others.

Commissioner GARRETSON. Give us your idea of the spinal column, the backbone of the idea out of which all the others lead.

Mr. MCCARTHY. The backbone here is that the State must invest in human beings in the same way as you invest in cattle on a farm, in the same way you invest in a factory. You have got to have better human beings. To get better human being you have got to give them the opportunity to live, aspirations to attain, ideals to attain, the door of opportunity opened before them, health, and strength. I am pointing out a few things.

Commissioner O'CONNELL. Your idea is to build people up physically?

Mr. MCCARTHY. Yes; using the word "physical" in a big sense; physically, mentally, and all those things. A man will produce more, and the employer will get more for his money, and the State will get more out of the man, and my idea is that the State ought to invest in the health, strength, intelligence, and ability of the people who make up the State. Understand that I am not speak-

ing in a physical sense only. We must never forget that a man is not a horse. He wants to see the child that he dreams about attain to something better than he attained to. He wants to see his boy and girl come up. We hear a great deal about self-made men, the Benjamin Franklins, the Abraham Lincolns, and men of that sort. We want a chance for every fellow. We do not want and lords and commons here.

Commissioner LENNON. If you do not want any Commons, what are you going to do with the professor? [Laughter.]

Commissioner WEINSTOCK. We will take Commons even if he is a professor.

Mr. McCARTHY. I have a project before the political science association for the making of men like Commons. I have been making a lot of them. John is the chairman of one committee of the economic association and I am chairman of another, and we propose to take these young professors and put them at work on actual problems. That is, we put six or eight of our boys into actual work somewhere, and we tell them, "You can spend a year here, and the time that you are here will be credited on your work in the University of Wisconsin." After we have been doing that for a while we are going to make a new kind of professor in the future. The way the boy goes to college now he listens to a lot of lectures, just as they do in China, and he takes these things down. The professor says, "Johnny, learn page 10." The next day he says, "Johnny, recite page 10." If he can remember perfectly what he has read, then he gets a high mark, and if he is a really good high-mark man he becomes a professor, to imitate the whole thing over again. In the University of Wisconsin we are trying to do something different from that, because we want to turn out men like John Commons.

Commissioner O'CONNELL. I agree with you on the idea of the practicability of that.

Mr. McCARTHY. In Wisconsin we are trying to do that. Leiserson is a boy of mine. We have got a bunch of them. Fitch is another. Fitch was the sleepest fellow I ever saw until John took hold of him and took him down on a survey in Pennsylvania, and he waked up, and we could do something with him afterwards. We are getting people to see how we can enlist the constructive forces for good government in this country, in a way that never existed before, by simply combining the practical with the theoretical. The thing which has characterized the University of Wisconsin has been attempts of that kind to bring its boys and girls into practical things. We want to make a system out of it, working away with these professors in the political science department and asking them to indorse it. Now we ought to carry out the same idea in industrial education. You are not going to do it to trade schools.

Commissioner O'CONNELL. You are not going to give them a certificate at the end of six months?

Mr. McCARTHY. No. Of course they are going to work at 16, 17, and 18 years of age, but while they are working we are going to say to the manufacturer, "You have got to give them something out of your time."

Now, I have told you about what will be the backbone; and I have put down only four or five things. If you start that sort of thing and you work it out and stick right to it, and do not let anybody get off on side streets, you will have something a year from now or two years from now that you can lay before the American people and put it up to the President and to Congress and put out in the magazines. It will be presented in such a dignified way, it will be full of such irresistible logic that Congress will not dare refuse to take it. There would be a program which would bring other things with it, all making for betterment, and when you take one of these things here you will find it winding out into all sorts of other things.

Now that is only a small, rough outline. I shall be glad to answer questions. I can not join your organization, because I have got too much work to do. You could not hire me to join it.

Commissioner WEINSTOCK. I was saying while you were talking that we ought to take you away from Wisconsin and get you with us somehow, some-way.

Mr. McCARTHY. You can not do it. I will give you all the advice I have, but most of the men of my kind make a great big mistake sometimes through getting into politics, and then they are no good after that, or else they scatter their remedies all over. I have stuck to Wisconsin, right on that job for 13 years, and I am going to stick there until they fire me out. If they should ever say to me that I could stay if I would keep quiet, I would not keep quiet. I am going to keep right on until they fire me.

Commissioner GARRETSON. Have you got in your list there two of the subjects that Mr. Leiserson mentioned—child labor and tuberculosis?

Mr. McCARTHY. I am not going to talk about that, but I have some of my boys on those things, and I have some good works in my library.

Commissioner WEINSTOCK. Supposing that we should invite you to do exactly what you suggested that somebody else should do; that is, that you take your corps of young men and prepare tentative or possible legislative measures to be submitted to us to be pulled to pieces and "kicked to death."

Mr. McCARTHY. I would not at the present time state whether I would do that or not, because I would have to think of the crowd I could get together for it. Mind you, these boys are all employed at the present time in different things. We can not turn them out fast enough. The people in the cities want them. I have turned the best men I have had recently into agricultural organization work and the standardizing of our produce. We never can get our produce into the cities unless we can standardize it among the farmers.

The CHAIRMAN. Briefly, what are they doing in the respect of standardizing products?

Mr. McCARTHY. You know at the present time the middle man can not be eliminated unless farm products are standardized.

The CHAIRMAN. Would not that affect this matter of industrial unrest so far as farm labor is concerned? Would not the standardizing of farm products bring them back to the land and make them more efficient?

Mr. McCARTHY. Yes. There are things in which men can work the whole year through, if you can arrange it properly. If you can make it profitable to the farmers to put a little house on his land and get the farm labor to stay there, and to see that it is worth while and give him some chance that will be better for the farm laborer, and it will be better for the farmer.

The CHAIRMAN. What is your present standardizing scheme in Wisconsin?

Mr. McCARTHY. It is so new a thing that I would not want to state it for the record here. I am perfectly willing to state it confidentially.

Commissioner WEINSTOCK. You pointed out in your remarks that while our population has increased some twenty million odd people in the last decade our agricultural production has decreased 10 per cent?

Mr. McCARTHY. Yes.

Commissioner WEINSTOCK. Ought not that in itself to be an incentive to get back to the land, because of the rise in the value of agricultural products, giving them a greater profit than ever before?

Mr. McCARTHY. Yes. There are some very interesting facts in reference to this. Iowa has lost in population, and 19 counties in Wisconsin, in the most prosperous sections, have lost population. They have gone to the cities. In some of those places there are actually no farms out there, and the price of food products is continually increasing. Here is the situation: Our land has been worked out to a large extent. The farmers do not get as much out of it as they ought. Take the year 1873. Why was it that the farmers were poor then? They were selling grain in Europe, the price of grain was away down low, and the farmers were simply competing against one another at that time, and they were mining the soil and selling stuff in the cities at 80 cents where they ought to have sold it for a dollar. Now that the tariff wall has been taken down we are allowing Canada to sell into this country at 80 cents what ought to sell at a dollar, and that is coming out of their soil, whereas the American soil has been prematurely worn out.

Commissioner WEINSTOCK. Wasted.

Mr. McCARTHY. Yes. There are farmers who are making money. Quite a lot of them, but they are a lot of the 2,500,000 renters who are scratching along, while the men who own the land are making money out of it, to some extent. There are all kinds of poor conditions of transportation, and all kinds of middlemen stuck in between them and the consumers. Take the State of Georgia. One of the reports issued recently showed that there was as much cotton produced in one county as the total valuation of the entire county. Seventy-six per cent of the cotton farmers in that county were renters who were being carried along by the men who dealt in supplies, giving them bad seed and bad supplies, and charging them 60 or 70 per cent interest for it. They were not getting ahead any more than the Irish people were, or any more than the people in any other country have gotten along, where the renting system grew up. However much apparently the law of supply and demand raises the price of the goods, there are too many people getting it, and the farmer does not get as much of it as he ought to.

The CHAIRMAN. Prof. Commons has suggested to me that you probably are going to stay over for a few days, and that we might see you again?

Mr. McCARTHY. My whole life is enlisted in this kind of work. If I can be of any service to you, I will do it at any time.

The CHAIRMAN. You will be here a few days, then?

Mr. McCARTHY. As I look around you I know that you are in earnest; that you are not bum politicians; but that you are trying to do right, and I will work with you heart and soul.

The CHAIRMAN. I want to say to you that we are profoundly thankful to you for your suggestions, and for the splendid spirit in which you have gone at this thing. We will expect to see you again.

WASHINGTON, D. C., *December 31, 1913.*

The commission met, pursuant to adjournment of Tuesday, December 30, 1913, at 9.30 a. m.

Commissioner WEINSTOCK. What shall this commission do about sitting to-morrow, it being New Year's?

The CHAIRMAN. I was going to say there are two gentlemen present who have some very definite ideas to put before the commission, and I think we can hear both of them before the usual hour of recess.

Commissioner WEINSTOCK. To-day?

The CHAIRMAN. Yes.

Commissioner WEINSTOCK. I was speaking about to-morrow.

Commissioner LENNON. I move that we meet at the usual time to-morrow.

The CHAIRMAN. I should much prefer to work to-morrow.

Commissioner HARRIMAN. I am ready to do whatever the commission sees fit.

(After further informal discussion, it was determined to continue the session of the commission to-morrow, January 1, 1914, at 9.30 a. m.)

Commissioner COMMONS. Mr. Bloomfield has been here for a couple of days. He is connected with the Educational Bureau of Boston and is on an investigation growing out of the question of vocational guidance, as to the subject of the hiring and firing of employees by corporations. I have asked him to come here, as it seemed to grow so directly out of these questions we have had before us, and I felt that Mr. Bloomfield would add to the information of the commission at least and let us know of the important investigation he has started.

STATEMENT OF MR. MEYER BLOOMFIELD.

Mr. BLOOMFIELD. Mr. Chairman and members of the commission, I shall make a very brief statement. I do not know whether you will get just what you want of me, but I know you will cross-examine me and ask whatever questions you desire.

The CHAIRMAN. What is your present occupation?

Mr. BLOOMFIELD. I am a director of the Vocational Bureau of Boston.

The CHAIRMAN. And your connection with any other institution, if there is any at the present time, any institution or public or private body?

Mr. BLOOMFIELD. I am at the head of a settlement house, the Civic Service House of Boston, and I am connected with a number of institutions.

The CHAIRMAN. Are you connected with any schools?

Mr. BLOOMFIELD. I am supposed to be the lecturer on vocational guidance at Harvard, and I have university appointments with the University of Indiana, the University of California, and the State Teachers' College of Colorado. And Mr. Lennon's presence reminds me also that I have the peculiar position of being the labor member on the board of arbitration in the garment trades in Boston under the protocol, because I was interested in the New York situation and spent a good deal of time there at the time of the strike; and in our settlement work we have had among our activities of the garment workers and providing headquarters for all sorts of labor matters.

The vocational bureau grew out of the settlement work we have had. It is an attempt to organize industrial and other information for young people particularly who ought to be planning to enter life intelligently. In that connection we issue a series of studies and occupational booklet, which are in use in all the schools of Boston and throughout the country in many schools and in a number of colleges. I have been carrying on industrial investigations of that sort for three years. In connection with that work we found it necessary

to bring the employers in in the same cooperative scheme that we brought in the teachers and social workers; and in saying employers I soon realized we were using a very vague term, as the employer is generally busy and does not come in contact with these young people we are trying to train and guide. It occurred to us, therefore, that the employment superintendents ought to be brought together in an association to discuss the same problem that we in our own worlds discuss with our own language, and which the employer does not get a chance to get at, and then often wonders why things break once in a while. So, two years ago, we organized an employment superintendents' association and it has been growing, and there are 40 members representing the largest employers in Greater Boston, establishments like the John Long Co., Filene, Schrafft, and all branches of industry.

We brought them together because we thought the men who do the hiring of men and who handle this human product of the schools ought to get some idea of what fitness and future means in the career of a child and in the life of the worker. They were men who had never been organized before. It was almost the only thing I had not found organized in a number of establishments. The credit men were organized, and the salesmen and the janitors and sweepers, but the men who pump the lifeblood into an establishment had never come together to discuss their problem. And they are the most difficult problems in the entire establishment. Furthermore, we found that the employment man on the whole was never properly appreciated in the scheme of things. He was often a last thought, an afterthought, an under dog in the establishment, and a necessary evil. He ought to be the best trained and most important man in the efficiency scheme of an establishment, with very large powers of supervision over those who do the discharging, with a very definite say in the matters of promotion. Now, because the employment men have no responsibility we found in establishment after establishment a terrific preventable waste of turnover, of injustice, and of friction and favoritism.

Commissioner WEINSTOCK. Pardon me, but will you be good enough to explain what is meant by employment man?

Mr. BLOOMFIELD. A man in charge of hiring he is often called.

Commissioner WEINSTOCK. In Boston one man hires and another fires.

Mr. BLOOMFIELD. Yes; in a great many instances.

Commissioner WEINSTOCK. Both functions are not performed by the same man.

Mr. BLOOMFIELD. Very rarely by the same man. Very rarely is the employment man supposed to exercise any intelligence. He is kind of a human store-keeper. He gets a request for 50 of this and 50 of that and goes out and fills a mechanical order, and he is the man who takes the first guess, and then everybody else gets a chance to guess all along the line. In a few establishments they have rating sheets. In some establishments they try to organize the promotion scheme. The trouble with that is there is nobody to check the checkers and to judge the judges, and because of that all sorts of peculiar things happen. If I had known I should have a chance to come before you on this short trip, I would have brought illustrations with me, but you know from your own experience that the general scheme of hiring, promotion, and discharge is about the loosest thing in an industrial establishment. And because of that not only is all kinds of injustice possible and friction, but we know of strikes and outbreaks provoked by that situation. And that, of course, is your main interest. There are other phases of this waste which concern the community as a whole, but I know you want to confine yourself to the causes of irritation and the sources of friction, and especially the preventable sources of friction, and there is one. We have a number of recommendations which I have not based on a country-wide investigation, which we have not made, but which we think will be in time, because we want to undertake it.

We have some establishments who have been pioneers in the effort of introducing some kind of order and justice into this situation, and they have an intelligent scheme of selection. They expect the employment manager to be a real staff executive, and have given him some real power, and his judgment counts, and there is an attempt made at an intelligent record of what the employees can do and a preliminary try-out of their capacity. So if they are placed in a department that has a vacancy and happens to need one of the talents which this individual represents, that individual will be placed temporarily. In his record is noted what he can do very well in other departments, so that when his job becomes unnecessary in this first place, he is not discharged. There is a record kept that he can do something else, so he is trans-

ferred. The last thing they want to do is to discharge a man, and naturally in the average establishment where there is no line on what people can do outside of the one specific thing, discharge is the only thing possible. It is very rarely that anybody would think of going to another department for this type of ability when this brings in a question of the study of the application employment blanks. I have been collecting for about two years the application blanks and questions and rule books and whatever meager material there is in different stores and establishments. Those documents also show why there must be a good deal of unintelligent waste. We have found in our studies and in issuing these small booklets, on what different industries require, that almost no employment managers have sufficiently analyzed the question to know what they want, to lay down intelligently what is required. When you give them oftentimes what they ought to have, they do not know what they need. These application blanks, if you will cut off the letterheads of the individual houses, you could shuffle the pack of them and you would not know whether it was a department store or a shoe factory or some railroad, with all due respect to Mr. Delano; you would not know what industry is asking the question. It is unthinkable that we can place people right and secure permanence and efficiency and contentment for which one has in a job which he should be doing, while this blindness to the needs of the situation exists.

Employers realize it is a serious problem, just as do the working people, and they realize it so seriously that they slop over sometimes and employ phrenologists and mind readers and all sorts of things to get some solution of the problem. But their method of approach is absolutely the wrong method. This is simply to indicate that there is a real problem there, and it is felt all along the line from every viewpoint. That is all I have to say.

The CHAIRMAN. We are very much obliged to you.

Commissioner GARRETSON. You have not found any astrologers, have you?

Mr. BLOOMFIELD. I suppose they will come out.

The CHAIRMAN. Are there any questions which the commission desires to ask Mr. Bloomfield? I suppose we are about at the point now where we might go into our executive session.

Commissioner O'CONNELL. I suggest we might go into a formal executive session before we adjourn.

The CHAIRMAN. Very good. There is just one suggestion that Mr. Croxton had to offer, which I think is very valuable and which I believe he should state now.

STATEMENT OF MR. F. C. CROXTON—Recalled.

Mr. CROXTON. It will take not more than three minutes; I am a man of few words and many figures. My new work involves giving considerable attention to accident statistics. I am speaking now as chief statistician of the Ohio Industrial Commission. The next year will probably see 80,000 accidents in the State of Ohio. Just recently I have been in conference with some of the accident men from the larger industrial organizations there, and one organization, one industry, may report accidents, no different whether they involve loss of time or not, and another may not call an accident and accident unless there is a loss of two days' time; or in other cases it may be a week's time. And some confusion exists between the different States. Pennsylvania, for instance, is asking for a report of all accidents lasting more than 48 hours; that is, where the employee is incapacitated for more than 48 hours. In our State we ask for a report of every accident, but we ask for it only from employers of five or more employees regularly.

Now, it is not possible for us to change the State laws, but it is possible for us to get our accident statistics on some comparable basis so that one State may have the advantage of the experience of another State. The purpose of accident statistics is not to compile together figures, but to lead right up to accident prevention, and we need all the experience that we can get from the other States as well as our own.

I submitted a memorandum to our own Industrial Commission of Ohio about a month ago, suggesting that we call a conference of the men who were actually engaged in accident prevention and in the compilation of accident statistics, and arranged for some scheme of comparable statistics. And I said that the call might come either from this commission or the Ohio State Commission, or from the Federal Bureau of Labor; and they authorized me to proceed either to call it as a State representative or to bring the matter to your attention, just as I saw fit. And it seemed a better method to bring it to your attention,

Mr. Chairman. It is not something that would require the work of the commission, but the work of the people who are actively engaged in this sort of thing throughout the country.

The CHAIRMAN. Have you submitted the matter to Mr. Lauck?

Mr. CROXTON. I have in writing, and if you want I can get Dr. Meeker, of the Federal bureau, to cooperate. There is a certain advantage in having the Federal Government back of these things, as there is a certain rivalry between States. And I can get him to join in the call, I think. We can have a meeting in Columbus, as I think it is more central than Washington.

Commissioner COMMONS. We started that three years ago in Wisconsin, and we found that we could not get any uniformity, simply because every State was determined to go its own way; and if your scheme is a method of bringing pressure upon States that will bring about some sort of uniformity it might be something this commission could do.

The CHAIRMAN. Could we gather the information? Could a Federal labor bureau gather that information in that form, irrespective of the action of the State?

Mr. CROXTON. I might say this, answering both questions, that we must follow our State law; we must get a report of every accident, regardless of whether there was a loss of time. And in another State they must report every accident lasting two or more days. There are certain fundamentals we can bring together. For instance, we can tabulate those lasting less than two days, and we can agree on something of that kind. I would feel safe in saying there would not be an ytrouble in sitting down with you, Prof. Commons, or with your statistician, and working out some scheme whereby the statistics for your State can be made comparable with the statistics for our State; not fully, however, as we have to show more than you do.

Commissioner COMMONS. Would you want to go further and make a recommendation that the States adopt uniform requirements for the statistics of accidents?

Mr. CROXTON. I would like to, but I do not know whether we are quite up to that or not. We can lead, but we must follow, too. I am afraid we could not do that because many of these States would not want to change.

Commissioner DELANO. A table which would show the different methods of preparing statistics in different States would be valuable.

Commissioner WEINSTOCK. Your idea would be to standardize the States and have a uniform system?

Mr. CROXTON. So far as possible. It seems to me we can standardize the fundamentals. For instance, I can eliminate the accidents of less than two days from our reports in order to make the statistics comparable with Pennsylvania.

Commissioner WEINSTOCK. I think it is possible to do that, because a much more heroic task than that has been done. They have taken the countries of the world, including such backward countries as Russia and Egypt, and they have standardized their crop reports, and they are uniform all over the world.

Commissioner GARRETSON. Is it not a fact that the Government itself in its statistics on accidents needs as much curing as any place else?

Mr. CROXTON. It does, indeed. If you will allow me a moment more—I am interested in a good many things, and one is to keep from everlastingly bothering employers and trade organizations in our State and Federal investigations. I spent half the forenoon trying to arrange to help work out a plan of cooperative work between the Federal bureau and the New York State bureau on their price work, a subject I have been very closely connected with, so as to save going back to the merchants and employees constantly. First, the State government, and then the Federal Government, and then somebody else comes along. Let us do everything at one time and do it so it will be usable and show results rather than have each man work for himself and the devil take the hindmost, as we say. Now, of course, I do not know that this is feasible, but I believe it is, and I believe it will be a good piece of work for the commission if they can do just such things, and they will be lasting.

Commissioner COMMONS. Do you think we can do it better than Mr. Meeker's office can?

Mr. CROXTON. I think we can join with them. I am authorized to take it up for Ohio or I would ask you to authorize me to work as your consulting statistician and take it up as the man you might want to introduce it, or anyone else. I do not care. I am not asking for more work, but I will take up with you or with Dr. Meeker that question so long as we accomplish results.

Commissioner GARRETSON. Do not the Bureau of Labor Statistics and the Interstate Commerce Commission follow two dissimilar plans to get their information?

Mr. CROXTON. Absolutely; and I have been working hard to get them together there, as you know.

Commissioner GARRETSON. But does the Bureau of Statistics do it under any existing law or only under a ruling of the department?

Mr. CROXTON. No; we worked out our best plans there.

Commissioner GARRETSON. Well, that is true of the commission, also. It is nothing but the commission's regulation.

Mr. CROXTON. But it is under the law there; that is, the law is different. For instance, the Federal compensation act—

Commissioner GARRETSON. Oh, with you; but I mean with the Interstate Commerce Commission, they can change their requirements at any time.

Mr. CROXTON. Yes; at any time. Now, you can leave this matter for me to work out with your managing expert or turn it down.

The CHAIRMAN. We will take it up with the other matters to be given consideration.

We will now take a recess until 2.15.

(Whereupon, at 1 p. m., a recess was taken until 2 p. m.)

AFTER RECESS.

The commission met, pursuant to adjournment, at 2.35 o'clock p. m.

Commissioner GARRETSON. Mr. Chairman, I suppose every member of the commission here has been battered—I am using the word to describe my own experience—by those who have appeared here, or who have been interested here, to know what we are going to do along this line or the other. I have said to these men, "I have no idea what the commission will do on this, that, or the other. I am one individual member, and the commission has not found itself yet." Now, we will never find ourselves in our relation to each other until after a very considerable amount of discussion of these problems, and I do not believe we will ever become a mosaic until we have occupied a considerable time in the discussion of these things before arriving at definite action. Therefore, whenever we start in discussing a program, whatever it may be, whether the one submitted or modifications thereof that may be suggested, we are going to put in a good many hours before we get down to the proposition of the path we are going to travel.

Commissioner O'CONNELL. We have heard several phases of various conditions from the people who have come before us. There is an entire interest from whom we have not heard at all. The labor interest has had no representative before us at all. They are intensely interested in the success of this commission, and we have not heard from their representatives, who are behind the legislation that created this commission. They were the men who forced the legislation through. I was one of them. I spent a good many days and nights lobbying for the enactment of this law, because I am located here and have had charge of the federation legislative affairs in Washington as one of the committee of three who have conducted the campaign here. Now, we have had doctors of almost every type before us, but there are men who have given a life study to questions which we ought at least look into. For instance, there is Mr. Gompers, a man who has traveled all over the world and knows the history of all these things that Mr. Cohen talked about this morning, and he knows them from practical experience. Then, there is Mr. Mitchell, who has given a life study to the question of compensation and industrial relations and contractual relations. He had charge of those matters until his organization forced him to quit the federation. My own organization did the same thing with me. I am one of the originators of the National Civic Federation. Before we came to New York we were located in one room in Chicago.

There is Mr. Winslow, who has given study to these questions, not only in this country but has traveled abroad to study the question of industrial education, and he has made a report that is unequaled by any other report that has been made in the United States by anyone. Then there is Mr. Duncan, for instance, who is the head of one of the oldest organizations in the country and one of the ablest and broadest men in the labor movement of this country, and who has had a lifelong experience on contractual legislation in matters between employers and employees.

There are a number of such men. The opinions and advice of these men ought to be heard. I am in perfect accord with what Dr. Devine said the other day as to what the commission was created for and what caused its creation. I helped to change the law that was originally drafted providing for the creation of this commission. Mr. Gompers and I were the ones who drew up the things that he said ought to be put in. We would not agree to the law until it was changed in that way. There is a matter which I should like to state to this commission in confidence and not for the record.

Now, as conditions are similar at the present time to what they were when the commission was created, it seems to me that this commission can not do other than take notice of these things, either through the whole commission or through a subcommittee or by direction of some one to represent the commission in the matter.

My experience for 25 years in an executive capacity leads me to believe that you can not shift everything to the shoulders of some little fellow. When I wanted to get actual results in our organization, when they wanted to hear the boss speak, I had to go there and speak for myself, and then they did things, and I think that applies in this commission. If you are going to delegate all these things, big and little, to big and little fellows to go out and do, I have my doubt as to the result, even in getting the necessary information. If some little kid of a boy comes into my office for information, wants to go through my records, and look over our files, I give that fellow three or four looks to see whether he is big enough for that job, and ask him what he wants and all about it. I hesitate, and very often do not do it. If we want the big things, it takes big people to do them and get them, and I am of the opinion that this commission has got to busy itself, either as a whole or by a subcommittee, to get at some of the real underlying causes of this industrial unrest. I do not know of any better place to get it than right in the heat of the battle, where we can see conditions as they exist now, even better than after the conditions have quieted down. I think the situation in Calumet and in Colorado warrants it, and other situations warrant it.

I think this commission ought also to hear some laymen, practical men, men who have been up against the proposition of getting their fingers cut off and their noses ground down and their wages cut down and their hours of wages kept at the long time, and all that. They may not be so polished in the way of presenting things, but they will present ideas, they will give you thoughts and things you can work on; in addition to which you can get men here who are capable of presenting those things in just as intelligent a manner, and I believe from experience you will lead us along in the direction of avoiding unnecessary things.

I believe this commission ought, if it is possible, to have a subcommittee of the commission actively engaged all the time in this business. The job is so big, and it has got to be done in such a short time, and it has got to be worked out so quickly that in my opinion it can not be done by our meeting once in three months and probably never seeing one another in the meantime, and probably not even exchanging letters. I think we ought to have a sufficient active force in our commission, actively engaged all the time, every hour, in the work, either by a subcommittee or some other method, and to map out work and avoid unnecessary accumulation of things that only mean a piling up of work for stenographers or typewriters. I do not think we can accomplish things unless we do that. I have been an active man all my life, and every day when I close my desk I like to feel that I have either finished something or started something. It seems to me we ought to get ourselves into that position.

Commissioner LENNON. I think this work that Mr. O'Connell is telling about is the first and most pushing work. I think it is work that ought to be done.

Now, there is a personal matter which I may as well state at this time as at some other time. When I was asked to take this place, I said if I was appointed on this commission, I would give practically my whole time to the work. The President was assured of that when friends of mine went to see him, and I am going to do it. I am going to do that. I am going to give my whole time to the work. I want to be useful. It may sound egotistical, but I believe I am capable of being useful. I want to be useful, however, just where the commission wants me, and not anywhere else. I do not want to be useful where I myself would simply be satisfied, but I want to be useful where the commission can use me. I believe we should investigate in Colorado and Calumet and Indianapolis and Lawrence. That is not too far gone by; and above all the McNamara case. There is a lot to that case that, close to

it as I was in many respects, I do not know about, that I want to know about, and that I think the public ought to know about. If there is nothing more to know, we will find that out. If there are some things to know that reflect still worse on that organization than what has been brought out, I am in favor of the public knowing that, and if there are things to be found out that reflect less than the public now believe, we ought to know that.

There is the Los Angeles situation, where, so far as the spirit of dissatisfaction and the straining of industrial relations is concerned, the situation is actually worse than in any city in the world, unless it be the places where the contest is on right now. There is no city where there is comparatively industrial peace so far as strikes are concerned, where the relations between employers and employees are so strained as in Los Angeles, and I believe that they ought to be investigated.

Commissioner O'CONNELL. I think a subcommittee of this commission ought to be appointed, if there are members who can give their time to it. I am not looking for a job at all, but I explained to my organization at the last meeting that it must be understood that I could take all the time I wanted. That was understood when I was first approached on the matter of taking a position on this commission. I think a subcommittee of the commission should be delegated with power to make certain investigations, to hold certain hearings, and that the results of their investigations and hearings should be boiled down into the actual meat of them and copies of those hearings and reports sent to the members who have not been in attendance, so that they will be as familiar with the matter as though they had been there, while any other work that we may have is going on.

I think we should have a publicity man—somebody whose business, in connection with some other work that may be assigned to him, is the business of publicity. I think it is unfortunate for this commission that the delay in its appointment and the delay in securing the money with which to go ahead has rather mitigated against its success. Had the commission gone right on after the law was first passed, then we would have been right in the atmosphere that created the commission, but a year afterwards the atmosphere has cleared up somewhat.

But there are a great number of people in this country who are interested in what is going to be done. I do not refer now to those whom I have mentioned, but they expect to be called before this commission. They expect to have something to say to them as to the underlying causes of industrial unrest in this country. I think the sooner we get at that, the sooner we will be prepared to sit down and hear their ideas and then go on and get further information as to the cause of unrest. The things that have come before us have been very interesting and striking, but I do not feel as though they were the underlying causes of unrest. The things that make people hungry, the things that make people savages, are the things that appeal to me as the causes of unrest. Think of the factories, workshops, and mines, where women and children are employed under laborious conditions. Those are the things which make for unrest. I think we ought to interest ourselves quickly in the matter of getting at the basic causes. I think we ought to call before us the grouchiest, meanest employer we can find and let him pour his wrath on our heads, and let us hackle him a little bit, and we will find out what is the real trouble. I like to hear those men talk. I have got along with employers for 25 years, and I do not know of any enemy that I have among employers.

I think that these are some of the things that we ought to do, and we might have a kind of informal conference and draw out some of the plans that are in one another's minds. I hate to sit down for three months and not be doing anything. Mr. Walsh and Mr. Ballard and Mr. Weinstock and I have had a job. Mr. Weinstock has not had much association with us because of his great distance from us, but we have been doing some work on the side.

Commissioner WEINSTOCK. I think it might be of interest to find out how many members of the commission are available for continuous work, if continuous work should be needed.

The CHAIRMAN. My understanding is that this is exactly what we are going to get at when we come together. Mr. O'Connell has expressed a great deal of it here. I am as impatient to be at work as anybody on this commission, but we must lay the groundwork for it, and my notion is that you ought first to see what Mr. Lauck and Mrs. Harriman have projected, and what I have attempted to assist them in. They have covered a good deal of ground in 60 days, and they certainly have not lost any time. That is my information about it. If we had

started to hold investigations any sooner, I think it would have caused a waste of money and efforts. We have laid the groundwork, and it may be that every member of the commission will be of one mind as to what ought to be done in the appointment of subcommittees and what ought to be done about making these investigations and the reasons for them. There may be a difference of opinion, but I think we can thrash it out speedily. I do not understand that those who have appeared before us have appeared as witnesses.

When I hear a witness I want to hear all sides. If I were getting witnesses on the general causes of industrial unrest, I would take the heads of these associations. I would take Mr. Emery who has been around here, and I would ask Mr. O'Connell to get the American Federation of Labor people, and I would get some of the people who were in touch with these organizations that we have heard so much about as to coming dangers. We would hear all sides of it. So far as I am concerned, I know that this meeting has done me a lot of good, although I do not agree by any means with all that has been said, and although I have tried to separate the theoretical from the practical, and although I have noticed that the theoretical was much in preponderance. I suppose the rest of us have noticed that as we have gone along. Still we are laying the groundwork for what we are going to do, as I understand it, and this is the meeting at which we are to conclude as to just what we are going to do. I know in the talks I have had with various members of the commission, every member has seemed to have a pretty well-defined idea, and bring these things out, and get together on them if we can. If we can not do that, we will get a majority of the commission to define their policy and follow it out.

Commissioner WEINSTOCK. Then the problem is, what is the next one thing to do?

The CHAIRMAN. Mr. Ballard has some notions, and Mr. Garretson has some notions, and they are both temporarily absent, and I would not want anyone else to express their views for them.

Commissioner O'CONNELL. Oh, no.

The CHAIRMAN. I know Mr's. Harriman's views reasonably well. I know Mr. Ballard's views quite well, and I know Mr. Garretson's and Mr. Delano's views. I do not know Prof. Commons's views as well. I have had less talk with him than with anyone else. I think we will save two hours by waiting until Mr. Ballard and Mr. Garretson are here.

Commissioner HARRIMAN. I met Representative MacDonald, of Michigan, at the House of Representatives the other day, and he said he wanted to come here, so he came down to see me, and he saw Mr. Lauck and myself. He said he went to see the President and asked him if he would push a congressional investigation of conditions in Calumet. The President did not give him any promise one way or the other. He said he was very much interested and very much beset by the condition there, but he said to him, "We have an industrial commission now from which I am hoping great things, and I think in all probability we are going to throw light on this very situation that you are talking about"; but Mr. MacDonald does not want us to do that. Did you not gather that, Mr. Lauck?

Mr. LAUCK. Yes.

Commissioner HARRIMAN. He wants a congressional investigation.

Commissioner O'CONNELL. I have talked with him about it. I think the congressional view of the matter would be largely political.

The CHAIRMAN. I think the administration looks largely to this commission to do some real work?

Commissioner HARRIMAN. I know it absolutely.

(At this point Commissioner Ballard returned to the conference room.)

Commissioner O'CONNELL. Representative Lewis, of Maryland, chairman of the Committee on Labor in the House, who is the father of the parcel-post bill, and who is interested in the public ownership of the telegraphs and so on, was very much interested in this bill, and was a member of the committee that reported the bill, when Secretary Wilson, of the Department of Labor, was chairman of that committee in the House, and Mr. Lewis, who is a very bright man, is very much interested in coming before this committee.

Mr. LAUCK. We tried to get hold of him for this meeting, but he is out of town.

Commissioner O'CONNELL. He spoke to me, and wanted me to arrange some time for him to have a chance to talk to a subcommittee with regard to some matters that he wanted to bring to the attention of the commission.

(At this point an informal recess was taken, after which the commission reassembled.)

Commissioner DELANO. I move that the matter of furniture for the offices of this commission be left to a committee to be appointed.

The CHAIRMAN. Prof. Commons says that we can get all the room we want in the Commerce Building for 60 cents a foot, and we are paying \$1.20 a foot here. Suppose we leave that in the hands of a committee to do what is best. Mr. Delano and Mr. Weinstock—

Commissioner DELANO. I think you had better leave me off the committee.

Commissioner WEINSTOCK. It would not be practicable for me to act on that committee.

The CHAIRMAN. Then, how about this suggestion, that the committee consist of Mr. O'Connell, Mrs. Harriman, and Mr. Ballard?

Commissioner HARRIMAN. I suggest Mr. Lennon in my place.

The CHAIRMAN. Inasmuch as you are the resident commissioner.

Commissioner HARRIMAN. I have so many things to catch up with that I would rather not do it.

Commissioner O'CONNELL. Do you mean the matter of finding new offices?

The CHAIRMAN. The whole question.

Commissioner BALLARD. These quarters are scarcely large enough, anyhow, and we can get twice as much space for the same amount of money in the Commerce Building, as I have been informed.

Commissioner GARRETSON. Is that the Interstate Commerce Building?

The CHAIRMAN. The Department of Commerce Building.

Mr. LAUCK. There is another point in that connection. We might get quarters for nothing, so a committee ought to be empowered to look into that. The War Department may give us rooms for nothing.

Commissioner HARRIMAN. I do not know whether Secretary Garrison was serious or joking, but he said he did not know why we did not come to the War Department; that the Red Cross people had their offices there.

Commissioner WEINSTOCK. I move that a committee be appointed with full power to act.

Mr. LAUCK. The old Economy and Efficiency Commission had 11 rooms in a building across the street from the War Department, and I understand those rooms are going to be vacant.

The CHAIRMAN. Suppose we let Mr. O'Connell and Mr. Ballard, in connection with Mr. Lauck, go ahead and do the thing. I will add Mr. Lennon to that committee. If there is no objection, I will appoint a committee of three, consisting of Messrs. O'Connell, Ballard, and Lennon, to take up the question of quarters and furniture.

Commissioner O'CONNELL. Are we empowered to go ahead and do what is necessary?

The CHAIRMAN. Yes.

Commissioner WEINSTOCK. Might it not be well to give them authority to get whatever furniture may be needed?

The CHAIRMAN. Yes. That is your authority, to secure furniture, and with full power to act.

Commissioner WEINSTOCK. I call for the question.

The CHAIRMAN. If there is no objection that will be agreed to, and that committee is appointed.

Now, what is the pleasure of the commission with reference to this program?

Commissioner COMMONS. Would it not be a good idea for us to go into committee of the whole and not have anything taken down, in the discussion of this program, whether we are going to take up the question of strikes, etc., so that, if we wish, all of us may change our minds?

Commissioner WEINSTOCK. Just to find out where we are at.

Commissioner COMMONS. I have some pretty definite ideas on the subject.

Commissioner WEINSTOCK. And I have not.

Commissioner COMMONS. And I want to change my mind if necessary.

The CHAIRMAN. It is moved that we go into committee of the whole, without the stenographer.

(The motion was agreed to.)

Whereupon, at 4 o'clock p. m., the commission resolved itself into committee of the whole, in executive session.)

TRADE AGREEMENTS IN COLLECTIVE BARGAINING

(For exhibits under this subject, see pages 748 to 761.)

COMMISSION ON INDUSTRIAL RELATIONS.

WASHINGTON, D. C., *Monday, April 6, 1914.*

The commission met at 10 o'clock a. m., in the assembly room of the Shoreham Hotel.

Present: Commissioners John R. Commons (acting chairman), Mrs. J. Borden Harriman, Frederick A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, and James O'Connell.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. F. H. Bird, superintendent of Division of Public Agencies; and Mr. B. M. Manly, superintendent Division of Industrial Investigations.

The ACTING CHAIRMAN. The commission have been waiting for one or two witnesses, but as they have not appeared, we will go ahead to save time.

The hearings this week are mainly on the subject of trade agreements in collective bargaining with reference to associations which have had a practical experience in that matter during the last 10 or 20 years.

We want to bring out such things as the personal experience which these gentlemen have had in these contracts will show—what are the essentials of the different agreements, the methods of negotiation, how they are brought together, the effects on the profits and liberties of the employers, and on the wages and on the industry generally; such difficulties as might arise in the way of carrying out agreements; if arbitrators or odd men are chosen, in what way and what are their powers, and whether a system works well with arbitrators or without arbitrators, and what questions are excluded from arbitration; the question of the extent of organization on both sides that is necessary to make it successful, and then suggestions for improvements, whatever the witness from his own knowledge and experience, might have to offer, in order that the commission, in its final report, might make some substantial suggestions or recommendations on this subject based on actual experience of different organizations on agreements that have been successful and on agreements that have failed.

The adviser of the commission, Mr. Thompson, has charge of the hearings and will call the witnesses, and we will now proceed with the hearing.

Mr. THOMPSON. Mr. Chairman, I would like first to call Mr. Mitchell.

TESTIMONY OF MR. JOHN MITCHELL.

Mr. THOMPSON. Mr. Mitchell, for the purpose of the record, will you kindly give the reporter your name and address, your present business, and your connection, past and present, with the mining field, particularly the anthracite field, or both the anthracite and bituminous fields?

Mr. MITCHELL. My name is John Mitchell. I am now a member of the State Working Men's Compensation Commission of New York. By the way, I have only held that position for the past few days.

From 1898 until 1908, a period of 10 years, I was president of the United Mine Workers of America, and for the past 15 years, ending with the 1st of January, I was second vice president of the American Federation of Labor.

Mr. THOMPSON. Will you please give, as far as you know it, the history of trade agreements in the anthracite coal fields, and your own connection with such agreements?

Mr. MITCHELL. May I preface the testimony by saying that the anthracite coal field does not offer the best field for the discussion of trade agreements. The bituminous field is the best example of the working of trade agreements in the coal industry.

Mr. THOMPSON. We had intended to cover both fields, Mr. Mitchell, with you.

Mr. MITCHELL. May I start with the bituminous field, then?

Mr. THOMPSON. You may start with the bituminous field, if you prefer.

Mr. MITCHELL. The United Mine Workers of America is an amalgamation of two rival international unions, each claiming jurisdiction over men employed in the coal-mining industry.

In the month of January, 1890, the National Protective Union and District Assembly 135 of the Knights of Labor, both organizations claiming and exercising jurisdiction of the coal industry, were amalgamated into what is now known as the United Mine Workers of America.

I am not familiar with all the efforts that were made prior to 1886 to negotiate trade agreements in the coal industry, but from 1886 until 1890 there were agreements to negotiate between mine owners and mine workers in various parts of the country, and attempts were made from time to time to arrange conferences for the purpose of making agreements covering the whole field of mining; that is, what we term interstate wage conferences.

However, the efforts were not very successful. In 1897, at a time when wages had fallen so low in the mining industry that men were not able to earn a living, and when mine owners were, because of the demoralization of the trade, unable to make profits upon their investments, and at a time when it seemed impossible to arrange conferences between mine owners and mine workers for the purpose of negotiating wage conferences, the miners decided that it would be necessary to inaugurate a strike in order to compel, if possible, the mine owners to meet an interstate convention for the purpose of negotiating a wage agreement, and on the 4th of July, 1897, a national strike of coal miners was ordered.

May I say at this point that at that time there were but 9,000 organized coal miners in the United States, and the industry at that time employed approximately 400,000 men.

The miners adopted as a slogan that "We might as well starve idle as starve working" and the response to the call for a strike was general throughout what we call the central competitive coal field; that is to say, western Pennsylvania, Ohio, Indiana, Illinois, and some States west of the Missouri River.

After striking for some two months, and in some places for four months, a settlement was arranged, and an advance in wages secured.

One condition of that settlement of that strike was that in the spring of 1898 the mine owners of western Pennsylvania, Ohio, Indiana, and Illinois were to meet with the representatives of the United Mine Workers of America in interstate convention for the purpose of making an agreement.

In the month of February, 1898, there convened in the city of Chicago the representatives of the miners and mine owners of the four States just mentioned, and at that conference the first general trade agreement between the miners and mine owners was made and effected.

I have here, and can furnish for the record, the organization of that convention, and I think perhaps it would be of great value to your investigation if the record were to show just how a wage conference is organized.

The agreement made in this Chicago conference was for a period of one year, with an agreement that at the expiration of the contract, or prior to its expiration, there was to be another conference of the parties to the contract for the purpose of considering the making of another contract. Those conferences have been held annually or biennially from that time until now.

It is true that upon the expiration of some of these agreements with the miners and mine owners they have failed to renew their contracts, and that their interstate joint conferences have temporarily dissolved, making it necessary to negotiate the agreements by districts—that is, by States, rather than by interstate conferences—but in every instance a year later or two years later the interstate joint conference movement has been rehabilitated and negotiations reopened and contracts made.

In the mining industry, which, by the way, is perhaps the greatest experiment that has ever been made in the matter of trade agreements—that is to say, the contracts affect more men than in any other industry in the United States; in the States of Illinois, Ohio, Indiana, and western Pennsylvania there are employed approximately 200,000 men—these contracts that are made in interstate convention determine the wages and conditions of employment for all these men. Furthermore, the contracts fixed the basis upon which other contracts are negotiated in other States and other districts.

In 1903, following the negotiation of the contract between the miners and mine owners of the central competitive field—that is, western Pennsylvania,

Ohio, Indiana, and Illinois—the operators and miners of what we call the southwest district—that is, Arkansas, Oklahoma (then Indian Territory), Missouri, and Kansas—met in interstate convention and formulated an agreement. That movement in the Southwest still continues, and either annually or biennially contracts are made affecting the mines of all those districts.

In the eastern part of the country, central Pennsylvania, which employs approximately 100,000 men, they have entered into contractual relations, and agreements are made annually there.

In the Southern States agreements are made between the miners and operators of separate States. There is no interstate movement in the South.

In Michigan and the North they have interstate agreements.

In later years this process of making wage agreements and establishing industrial relations has been carried into the Northwestern States. At the present time the States of Wyoming and Montana constitute one trade or scale district, and the State of Washington is a separate district.

The process has been carried beyond the confines of the United States, and applies in many parts of Canada.

So that in the United States at the present time there are approximately 750,000 mine workers employed, and I estimate—it must be a rough estimate, because we have no means of getting the exact figures—that 525,000 mine workers have their wages and conditions of employment determined and fixed by agreement with mine owners.

In the organization of a convention of this kind the miners are represented by delegates from their local unions. If I may picture just one conference, for instance, it is customary for the miners and mine owners in the central competitive field to meet in the city of Indianapolis. The miners are selected by their local unions, and the mine owners select their representatives through their associations, or they may appear as individual owners of mines where there is no organization of mine owners.

The mine owners are seated on one side of a great hall and the mine workers' delegates are seated on the other side. By agreement each State and party to the conference is entitled to four votes; that is to say, the miners of western Pennsylvania have four votes, and the operators of western Pennsylvania have four votes; the same for Ohio and the same for Indiana and the same for Illinois.

No motion may be declared carried unless it receives the unanimous vote of all the parties to the conference. That is to say, a motion to fix wages or hours of labor or that relates to any main or principal question must receive the unanimous vote of all parties to the conference; otherwise the motion is declared lost.

This process, as you will readily understand, protects the interests of the miners and mine owners, because no combination can be made in the convention between the miners and mine operators of one State that would impose a wage scale upon the operators and mine owners of another State that they were unwilling to accept.

There is no arrangement made for the arbitration of a question of dispute, should they fail to reach an agreement; and that feature, of placing the responsibility squarely upon the parties to the dispute, the parties to the conference, is, in my judgment, the most important feature of the conference.

It is often suggested that provision should be made for the arbitration of a dispute should the parties to the dispute be unable to reach an agreement; but my own experience has satisfied me that such a provision would lead, inevitably, to the disruption of the whole movement. When men have the responsibility upon themselves, and they can not escape it by referring it to some other tribunal, they are much more likely to exercise their responsibility than they would be if they could escape it by referring the matter to some outside party.

The practicability of this method of doing business is demonstrated rather conclusively by the fact that there have been very few disagreements in any of these wage conferences. If there have been disagreements, they have been only temporary suspensions of negotiations, and before the scale actually expired, or before there was any prolonged suspension of work, the parties have met again in conference and have succeeded in making an agreement.

In 1902, or, rather, in 1900, an attempt was made to extend this method of regulating trade relations with employers to the anthracite coal fields, a district which at that time had 147,000 men employed. We were unable to persuade the mine owners that they should enter into contractual relations with the United Mine Workers of America, and a strike ensued that lasted for six

weeks and was settled by the owners conceding some advances in wages and improvements in conditions of employment, but no agreement was made.

In 1902 another strike occurred in the anthracite fields which resulted in a failure to negotiate a settlement, and that strike was settled by the intervention of the President of the United States and the appointment of a tribunal which was known as the Anthracite Coal Strike Commission, which after a very exhaustive investigation made an award increasing wages and reducing the hours of labor and improving the general conditions of the employment of the miners.

That award was to be effective for a period of three years. At the end of that time negotiations were opened with the anthracite coal mine owners, and from that time until this the wages and conditions of employment in the anthracite coal field have been determined by agreement with the representatives of the mine workers.

It is necessary at this point to say that in the anthracite field, which differentiates somewhat from the bituminous coal field, the agreement is not made officially with the United Mine Workers of America. The interstate mine owners—that is, the presidents of the railroads that operate the mines in the anthracite field—insist, first, that the agreement shall be made, but they will not make the agreement officially with that organization. They make it with the officers of the organizations, but the agreements are signed individually; for instance, in signing the agreement that I negotiated with them in 1906 I signed my name "John Mitchell" and struck out "President of the United Mine Workers of America." That, I take it, is done in order to save the dignity of the mine owners.

Perhaps I am talking without following your scheme?

Mr. THOMPSON. Now that you are speaking about the anthracite field, I will ask you what changes were made in the agreement of 1902 by the agreements of 1906, 1909, and 1912, if you know?

Mr. MITCHELL. The agreement of 1903, which was the award of the Anthracite Coal Strike Commission, was renewed in 1906 with only slight modifications as to the methods of adjusting grievances. There was no change made in the wages or hours of labor, but some better understanding was had as to the recognition of committees for the purpose of adjusting local grievances that arose from time to time.

The agreement of 1909 in the anthracite coal field was practically a renewal of the agreement of 1906. The agreement of 1912, about which Mr. Hayes will give better evidence when he appears on the stand, provided for an advance in wages—in figures 10 per cent, but in money, in actual increase in wages, about 5.6 per cent; that is to say, under agreements that had been negotiated prior to that time, or, rather, under the award of the Anthracite Coal Strike Commission, a sliding scale of wages was established. A minimum was fixed, and for each 5 cents a ton in the selling price of coal in New York Harbor or at tidewater the miners were to receive 1 per cent advance in their wages, and the result of that sliding scale aggregated to the mine workers an average advance of 4.4 per cent, or 4.6 per cent, I believe, so that the advance secured by the 1912 increase amounted in actual gain to the men to 5.4 per cent.

Mr. THOMPSON. Do you know, Mr. Mitchell, the conditions of the agreement of 1912 with reference to the grievance committee, or shall Mr. Hayes tell that?

Mr. MITCHELL. He will be more familiar with that, Mr. Thompson, than I am.

Mr. THOMPSON. If it should be that that agreement of 1912 provided for a different form of grievance committee, and one of the things provided for in that agreement in that respect was an umpire finally to pass upon grievances arising thereunder, would that mitigate against the principle which you have announced with reference to the method of arriving at interstate agreements between the bodies of miners as a whole and the operators as a whole, in the bituminous field, where the responsibility is placed directly on the operators and on the delegates of the miners, who had to work their way out thereunder? This, I would understand, applies to purely local grievances arising at the different mines.

Mr. MITCHELL. Yes; the provision of the interstate agreement with reference to difficulties or questions which can not be adjusted by conciliation was put in the agreement by the Anthracite Coal Strike Commission. That is not a new arrangement. The agreement of 1912 is supposed to be an improvement on any previous agreement. There is no question about that. It was a decided improvement. The Anthracite Coal Strike Commission, in its award, provided

that any grievance growing out of interpretation of the award and confined exclusively to disputes arising out of interpretation of the award, should be referred first to a board of conciliation, a board composed of one mine worker from each of the districts comprising the anthracite coal field—three in number—and one mine owner; and if they failed to reach an agreement as to a correct interpretation of the agreement or settlement of the dispute, then it should be referred to an umpire to be selected by the conciliation board. If they failed to agree upon an umpire, then Judge Gray, of the United States district court, who was chairman of the Anthracite Coal Strike Commission, was authorized to appoint an umpire. Originally they were unable to agree; the board of conciliation was unable to agree, and Judge Gray appointed Charles P. Neill, then Commissioner of Labor, to act as umpire; and Mr. Neill has acted as umpire in other disputes from time to time until the present, I believe. But, as I say, the function of this umpire was not to settle all disputes between mine owners and mine workers, but to settle only such disputes as grew out of the interpretation of the application of the award of the Anthracite Coal Strike Commission.

That situation in the anthracite coal field would have little relation to what I say in a general way about the importance of requiring the parties directly at interest to settle their own wage scales, because the umpire provided for by the Anthracite Coal Strike Commission does not have authority to fix wages, and no question of dispute as to what the wage scale shall be is referred to him.

Mr. THOMPSON. In regard to the settlement of disputes arising in individual mines—say, for instance, in the anthracite field, where arbitration is resorted to upon such questions as the discharge of a man, claims of discrimination, and other questions of the kind which may arise as to any employee—what is your opinion as to the advisability of having an umpire finally decide matters in case the parties can not agree on the basis of the conciliation program?

Mr. MITCHELL. I think in the anthracite field perhaps that is advisable. I would question the advisability of adopting that system in the bituminous field. We tried that in some of our bituminous districts. For instance, in one of our southwestern agreements with the operators of Arkansas, Oklahoma, Kansas, and Missouri, we did provide machinery for the adjustment of local disputes, such as the dismissal or the discharge of men, etc. We applied it in this way, that if the board of conciliation, or reference board, as we termed it, could not adjust the matter themselves, then it went to an umpire who was agreed upon in advance, and who was paid an annual salary jointly by the miners and mine operators. But our experience there seemed to discourage a continuance of that system. But it was found that the mine owners and miners would not agree upon a settlement of a dispute if agreeing brought some censure with it.

For instance, the representatives of the miners' union were not disposed to settle many cases that they could settle, because they could shoulder the responsibility off onto the umpire. The representatives of the mine owners were in exactly the same situation. Rather than yield at times a point when the miners were right in their demands they would say, "We will send it to the referee." The result was there was interminable delay in securing decisions from the referee. The situation grew so serious that many local strikes resulted, as the miners became impatient waiting for a decision from the referee. The mine owners, it is charged—though I can not say—sometimes closed down their mines as a means of enforcing their own interpretation of the agreement, because they could not wait for the decision of the referee.

In the bituminous field I question the wisdom of providing for the reference of local disputes to boards of arbitration. I think the better way is to provide machinery for the adjustment of grievances, and that the men who shall act shall be the representatives of the mine owners and the mine workers themselves.

Mr. THOMPSON. What is the method carried on in Illinois? Do not they have an arbitrator there finally for local disputes?

Mr. MITCHELL. No; they have a joint grievance committee to which all matters in dispute may be referred. In fact, in Illinois and some of the bituminous States they have courts. It will be necessary to know that our organization is first international, and then we have district organizations, which usually follow the lines of the States, and then within those we have subdistricts. If a grievance arises at a mine within one of those subdistricts, the subdistrict officers and representatives of the mine owners try to adjust it. If they fail, it goes on up to the district organization. If they fail to adjust it, then it is

referred to a man who is called a commissioner for the coal operators' association and to the president of the district union. If they fail to adjust it, it goes to a joint board which represents the executive committee of the mine owners' association and the executive committee of the mine workers' organization. That is the last court, the final court. If they can not settle it, then the parties are at liberty to take what they call independent action; that is, the mine workers may give up their jobs if they go on strike or the mine owners may close the mines. It rarely occurs that it is necessary to close the mines in that way.

Mr. THOMPSON. Do many grievances arise from the men in the mines? Is that a matter which is constantly being brought before these boards—individual grievances, for instance?

Mr. MITCHELL. Yes; a great many grievances arise. That is to say, there are a great many questions of dispute that it is necessary to refer either to the local committees or to the State committees for adjustment; but in proportion to the total number of men employed and the total number of mines there are not so many. I mean to say, if you speak of it in terms of proportion, there are not so many; but if you speak of it purely as to the number of grievances themselves there are a great many—or it would seem that there are a great many.

Mr. THOMPSON. In your opinion, the machinery that now exists in the bituminous coal fields for the settlement of differences is perfect, in your mind?

Mr. MITCHELL. No; I would not say it is perfect, Mr. Thompson. It is really a very serious problem. It is a question that has caused the representatives of the miners' union the greatest possible concern; it is a question that has caused the mine owners the most serious thought. In that I think I speak as well for my successors as for myself, that the question of finding some method by which local disputes may be adjusted without suspension of work is about the most serious question we have to consider; but as yet I have not been able, and I never was able, to evolve any suggestion that was an improvement upon our present method, and it is faulty. It is faulty for the reason that it sometimes happens, notwithstanding the fact that mine owners and mine workers are in perfect accord on all questions of wages and hours of labor, and that they are on contractual relations with each other, not only as regards their business relations but also regarding their personal relations, that they are fair and cordial, it sometimes happens that a local dispute arises that could not have been provided against; that is to say, some question comes into dispute which was not provided for in the agreement and could not have been foreseen by the parties in the making of the agreement when it was made, and it may lead to a suspension of work.

This, of course, is a most serious thing. I have always believed that what was needed more than anything else was education, that the mine owners and mine workers equally require education as to the importance of keeping inviolate these agreements that they enter into, and I think the mine owners are coming more and more to understand that these agreements, which are based purely upon the good faith of the parties, must be kept just as inviolate as that one man should keep his word when he gives it to another, for, after all, my own interpretation of the contract is that it is merely a promise of one man to another—"we are going to work under these conditions for a given period." Of course, there is no recourse in the courts about it; it is purely an agreement of honor.

But I think, as time goes by, the workingmen and employers more and more will become to understand that their own interests, as well as the interests of society, demand, first, that the agreement shall be made, and, second, that it shall be kept. Then we will have a less number of local strikes.

Mr. THOMPSON. I would like to ask you if you are acquainted with the protocol arrangement in New York by which there is a committee that is appointed to take up for immediate action these matters that arise from day to day and give them practically immediate hearing; are you acquainted with that agreement?

Mr. MITCHELL. Yes; I know in a general way about it.

Mr. THOMPSON. If that machinery would work with reference to the cloak industry, and provide a way out, would that be serviceable as to these matters of dispute in the coal fields which you say are matters of grave concern?

Mr. MITCHELL. I think not. It happens in the cloak industry in New York, for instance, that the questions that arise there would never arise in the coal industry. For instance, in the coal industry the question of wages is abso-

lutely determined during the life of the contract. In the bituminous coal fields there can be no change in the wages; but in the cloak industry every new fashion that comes in, every new design of a garment, must have a price fixed upon it, and that may be a question of dispute.

Again, under the protocol the question of whether a man is in the union or not is or may be a matter of dispute. In the coal industry no such question can arise. None of these questions can arise in the coal fields, because all the men in the bituminous coal fields are in the union under contract, and, as I say, the wages are absolutely determined in the agreement.

Mr. THOMPSON. Will you tell us what kind of questions do arise that cause local strikes and are the sources of concern to operators and mine owners?

Mr. MITCHELL. Questions of this kind: Sometimes the miners allege that the scales upon which their coal is weighed are out of order, that they are not recording correctly the weight of coal. There is a question that has caused a number of local strikes. For instance, in Illinois the State provides for a man whose duty it is to test scales. It may be possible that that weighman, that tester, can not come into the mine for several days, and the miners allege that during all those days they are not getting credit for full weight, and they stop work.

I am not attempting to justify their stopping work, but they do sometimes stop work. That is a question that might cause a strike at any moment. Then there is the question of discharging men. Under our agreement with the mine owners the question as to the working force is left exclusively to the mine owner, and his right to discharge is not disputed; and it is provided in the agreement that if a man alleges that he has been unjustly discharged, he may ask for an investigation, and if it is determined that he was discharged without cause, the mine owner is required to pay him for the time that he has been idle, pay him his wages.

Frequently a dispute arises as to whether a man was justly or unjustly discharged. He may allege that he was discharged without cause, and some of the men, feeling that he was correct in it, may go out at once and strike, and demand his reinstatement.

Then, again, there is the question of ventilation; the men might say that the mine was not ventilated according to law, what according to our law would be considered bad air, and the men walk out.

Mr. THOMPSON. What is the system that is maintained in the mines as the result of the agreement?

Mr. MITCHELL. Using Illinois again, in order to be typical, provision is made for fines; if the men go on strike in violation of the agreement they may be fined. I forget what the fine is, but I think the amount is something like \$1 a day for each day that he is idle in violation of the contract.

Mr. THOMPSON. Are those fines enforced?

Mr. MITCHELL. Not all the time. Under the terms of the agreement, if they are remitted it must be with the consent of the mine owner, and very frequently the mine owner appeals to the board that imposed the fine and asks that it be remitted; and at other times the officers of the miners' union find moral justification for a local strike and persuade the mine owners that the fine should be remitted. In many cases it is not collected. I do not know to what extent it is collected; nevertheless there are collections made, and penalties are collected from time to time.

Mr. THOMPSON. Where awards are made by the conference board in regard to any dispute, is there any trouble or delay about getting the award carried out by the operator or by the men?

Mr. MITCHELL. No; I think not. I think it would be a rare exception, if there be any, where the decision of the joint board would not be immediately carried into effect.

Mr. THOMPSON. As a general thing, have those awards been satisfactory to both parties?

Mr. MITCHELL. No; I think not, but they have been accepted. I suppose the person who lost his case perhaps has felt that he should have won it. I suppose it is very much like a decision of the court—the man who loses thinks he ought to have won; but there is a very generous acquiescence in the decision.

Mr. THOMPSON. Of course the theory of conciliation by representation of both parties and having an umpire, with the idea that we will get awards which offer every justice to the miner, that is not like decisions of the court, but they are such as to command the respect of the parties.

Mr. MITCHELL. I think, generally speaking, they do. I think the disposition of the mine owners and the mine workers would be, "The case was tried, we were fully represented, and therefore the decision must be accepted," although they may have the mental reservation that they think the decision should have been the other way.

Mr. THOMPSON. Referring to the anthracite field, is there a variation in the wages for the miners—the wages paid to miners—changing with the different mines; and what, if any, attempts has been made to standardize wages in that field?

Mr. MITCHELL. In the anthracite field there is, of course, no uniformity of wages at all. Originally, when the change in wages occurred—that is, at the end of the strike of 1900—an advance of 10 per cent upon the wages then paid was granted, which of course not only continued the inequalities but increased the inequalities. The man who was getting \$3 a day and who got a 10 per cent advance in his wages got 30 cents; the man who was getting \$2 a day and got 10 per cent advance only got 20 cents a day, so that that increased rather than lessened the difference between the wages paid to the men. That has continued up to the present time, with this exception: In the agreement of 1912 the provision was made that the minimum wage should be \$1.50 a day. Of course, that was for the lowest paid men; so that there was an attempt, and a successful attempt, to establish uniformity, or rather the start of a movement for uniformity was successful. Outside of that there has been very little done to establish uniformity of wages for the men working in the anthracite field; whereas in the bituminous field we have absolute uniformity of wages so far as each district is concerned. For instance, the wages in the Southwest may be higher than another central competitive field for the same class of work, but all the men who are doing the same class of work in the Central Western States receive the same wages for a day's labor. Eighty per cent of the men are employed at tonnage rates—piecework—and, of course, there is no uniformity in that.

Mr. THOMPSON. In the bituminous field, as I understand, they have differentials there?

Mr. MITCHELL. Yes.

Mr. THOMPSON. For the purpose of equalizing the cost to the operators?

Mr. MITCHELL. Yes.

Mr. THOMPSON. So that the operator will pay usually the same price per ton; how does that work against the miner with reference to his wages; does it give him the same day's wage or does that vary with that differential?

Mr. MITCHELL. No; it gives him the same day's wage. The day wages are the same. There is no difference where a man is employed within a scale district, but the miner's wages do vary. In a few moments I could explain how these day wages are arrived at. We take the Hocking Valley district of Ohio as a national basing point; that is, we determine what wages shall be paid in the Hocking Valley district, and from that we fix a competitive mining scale in all the other districts in a central competitive field, the Hocking Valley of Ohio, the Danville district of Illinois, the bituminous district of Indiana, and the thin vein in the Pittsburgh district of Pennsylvania.

For instance, in western Pennsylvania there are two veins of coal, one known as the thin vein and one known as the thick vein, the central thick vein. We select the thin as the basis upon which the base scale shall be made. It happens that they have the same scale for mining in the thin vein of western Pennsylvania, the Hocking Valley district of Ohio, and the bituminous district of Indiana, and the Danville district of Illinois. That scale is uniform. At the present time \$1 a ton is paid for mining screen coal in the Hocking Valley district, and \$1 for the thin vein in the Pittsburgh district, and \$1 for the bituminous district of Indiana, and 60 cents a ton for the Danville of Illinois, but the 60 cents paid in the Danville district is the same as \$1 a ton in the Hocking Valley, for the coal is mine-run coal. In the Hocking Valley it is screened coal. Now, if the Danville were on the same basis it would be \$1 a day.

Taking Illinois again, in the Danville it is 60 cents a ton for mine-run coal. Over there we separate Illinois into scale districts and we fix the mine prices at every one of these scale districts so as to enable the mine owner to compete in a common market or locality. For instance, Chicago is the great market for Illinois coal. The mines that are located closest to Chicago, which are the long-haul mines section of Illinois, pay higher rates than do the mines 300 miles from Chicago. There are two reasons for that. There is a thin vein, and its

proximity to the market makes it necessary to have a higher market price in order that the miners shall earn the same rates of wages, and it is necessary to pay more in order that they may not exclude the other mines from the Chicago market. I think at the present time there is no northern coal in Chicago, although they are the closest to the Chicago market. The market is in the Northwest. But the wages of the miners annually work out at about the same, at least all the thick-vein mines of northern Illinois. There the earnings of the men at the end of the year would be about the same. The attempt is made not only to regulate, but prevent unfair advantages in the market. The mine owner can have an unfair advantage in the market, but the attempt is made to regulate matters so that the miners may earn approximately the same wages a day in a year. I have with me a joint interstate agreement, which shows exactly how these scales are made; this was caused by the international scale for that year; then it takes the Illinois scale and all these subdistrict scales. I think that explains exactly the question you have asked.

Mr. THOMPSON. If you will, I would like to have you file that with the commission.

(The paper referred to entitled "The Illinois Coal Operators' Association; joint interstate agreement, Illinois State agreement, and local agreement for the scale year ending March 31, 1902," was filed with the commission by Mr. Mitchell and marked "Mitchell Exhibit No. 1.")

(Mitchell Exhibit No. 1, "The Illinois Coal Operators' Association Joint Interstate Agreement, etc., issued July 1, 1901, by the commissioner's office," was submitted in printed form.)

Mr. MITCHELL. I have also a table which I had compiled before I retired from the presidency of the United Mine Workers' Union, showing the effect of each agreement upon wage scales. It is divided into districts. For instance, this would indicate that in district No. 6, which is Ohio, the wages starting—making mining prices, for instance, for mining a ton of screened lump coal in the Hocking Valley district of Ohio in 1896 the miner received 45 cents; in 1907 he received 51 cents; the next year, 56 cents; the next year, 66 cents; then, 80 cents, then 90 cents, then 80 cents, then 90 cents; and that ends my own record. At the present time he receives \$1, an advance of 10 cents a ton paid in the last six years. It also indicates the hours of labor, starting with 10 hours for a day's work in 1897, and now 8 hours. It gives in detail the day wage scale, as well as the mine scale.

Mr. THOMPSON. Are we to get that Mr. Mitchell? "

Mr. MITCHELL. Yes, I will be very glad to file it.

(The paper referred to by Mr. Mitchell, entitled "Wage statistics referred to by John Mitchell, president U. M. W. of A., in report to convention, January, 1908," was filed with the commission and marked "Exhibit No. 2.")

(Mitchell Exhibit No. 2, "Wage Statistics referred to by John Mitchell, president U. M. W. of A., in report to convention, January, 1908," was submitted in printed form.)

Mr. MITCHELL. You wanted me to file with you also a copy of the organization of the interstate convention.

(The paper referred to by Mr. Mitchell, entitled "Rules adopted to govern the joint interstate convention of miners and operators, Indianapolis, 1906," was filed with the commission and marked "Mitchell Exhibit No. 3," and is as follows:)

RULES ADOPTED TO GOVERN THE JOINT INTERSTATE CONVENTION OF MINERS AND OPERATORS, INDIANAPOLIS, 1906.

(Central competitive field—Illinois, Indiana, Ohio, and western Pennsylvania.)

1. That the convention meet daily at 9 a. m. and 2 p. m. and adjourn at 12 m. and 5 p. m.

2. Special meetings may be held, or evening session, if so desired.

3. The miners' representatives shall occupy the right of the hall and the operators' the left, facing the stage.

4. That each State be allowed the same number of votes on the floor of the house—4 votes on behalf of the operators and 4 votes on behalf of the miners in each State.

5. That no vote be declared carried unless upon the affirmative vote of the miners and operators of each State. That upon all questions of mere procedure

the ordinary rules of parliamentary procedure, as stated in any standard manual, shall be the rules of this convention; and that in no event shall the rule requiring unanimous vote on all main and principal questions be suspended. Main and principal questions mean all questions affecting the proposed scale and agreement.

6. That each State represented in the convention have four operators and four miners on the scale committee, to be appointed with the understanding that each State may have an alternate for each representative, who shall have all the privileges of the scale committee, but shall have no vote except in the absence of his principal.

7. That sessions of the joint convention be open to the public except when otherwise ordered.

8. That the use of tobacco be prohibited in the hall during the convention.

G. W. SAVAGE,

Chairman.

F. S. BROOKS,

Secretary, Committee on Rules.

Mr. THOMPSON. Now, anything that would throw light upon this matter we would be very much pleased to have, Mr. Mitchell.

Mr. MITCHELL. This is a statement of the approximate number of men working under trade agreements in the coal-mining industry.

(The paper referred to by Mr. Mitchell is entitled "Approximate number of mine workers whose wages are determined by collective bargaining," and was filed with the commission, and marked "Mitchell Exhibit No. 4," and is as follows:)

Approximate number of mine workers whose wages are determined by collective bargaining.

Arkansas -----	4,000	Oklahoma -----	9,000
Illinois -----	80,000	Pennsylvania, bituminous-----	100,000
Indiana -----	20,000	Pennsylvania, anthracite-----	174,000
Iowa -----	16,000	Tennessee -----	3,000
Kansas -----	12,000	Texas -----	3,000
Kentucky -----	7,000	Washington -----	6,000
Missouri -----	10,000	West Virginia -----	20,000
Michigan -----	3,000	Wyoming -----	8,000
Montana -----	3,500		
Ohio -----	45,000	Total -----	523,500

There are approximately 750,000 coal miners in the United States.

Mr. THOMPSON. I would like to ask you how the differentials between the central field and the other fields are arrived at, generally—by what process or method?

Mr. MITCHELL. It would be difficult to explain to you the differentials between the central district and the other districts—how they are determined; but, if I understand what you mean, it is how the differentials are determined as between the basing points in the central field and the other districts. If that is what you mean, it is this, for instance, in fixing a scale at Danville, which is the basing point in Illinois, we take into account the mining price in the Hocking Valley, and, as I have heretofore stated, having determined the mining price in the Hocking Valley district of Ohio and the thin-vein district at Pittsburgh, the Danville of Illinois, and the bituminous of Indiana—we enter the field of Illinois because the Danville lies on the eastern border of Illinois and is, I think, something like three hours' run from Chicago—we ascertain what the freight rates are from Danville to Chicago—Chicago being a common market—what the cost of mining a ton of coal in Danville is, apart from the price paid for mining, because there are very many things which enter into the cost of mining a ton of coal besides what wages are paid to the miners, such as the character of the roof, the amount of timber required, and the other fixed expenses of operating a mine. Having determined, approximately, what it costs to put a ton of coal into the city of Chicago—that is, what the cost f. o. b. mine, Chicago, would be, and the price at which that character of coal sold for in Chicago—we then ascertain what would be approximately the same cost to a man who was located at Springfield, Ill., or at Belleville, Ill.—

well, Belleville, Ill., would not be a good type, because it ships to another market, but at Marion, Ill., in the extreme southern part of the State—having determined these costs we try to fix a price that would give the mine owner an equal competitive opportunity with the Chicago mine and which, at the same time, would take into account the earnings of the men.

As I say, it is impossible to determine the cost solely upon the earnings of the men, because if we were to do that, if we were to say that a man could earn \$4 a day at Danville he ought to earn \$4 at every other mine, because if the board fixed entirely upon wages some of the mines could not operate; the physical condition of the mine and the freight rates would exclude them from the market; so that if there be some natural condition in the mining field that makes it more expensive to operate these mines at a base point, we have to understand what the mine owners, I think, all recognize, that that burden should be carried in part by the mine owner by reduced profit, and part by the miners in less wages; so that in a rough way an attempt has been made to establish our mining scales, based upon the comparative opportunities of the different mining fields and perhaps upon the opportunities of the miners in the different fields to earn their wages.

MR. THOMPSON. Does this difference in wages of the miners cause any drifting of the men from one place to another?

MR. MITCHELL. Yes; there is considerable moving from one place to another. However, that is rather characteristic of miners anyway; that has always been so in this country, quite apart from wages; they move from one point to another, and, of course, the best men seek employment at a point where the work is most regular and the wages paid are highest.

MR. THOMPSON. With reference to the introduction of machinery in the coal field, is there any differential based on that matter; and if so, what is the purpose of it, and does that have any effect upon the introduction of machinery into the coal field?

MR. MITCHELL. Yes; in the bituminous coal industry of the United States approximately 30 per cent of all the coal is mined by machinery; perhaps it is more than that now, because during the past two years there has been a tremendous improvement in the way of machinery in the mining industry. We have not adopted a uniform scale of mining machinery, although in the State of Illinois, in all except the Danville district, there is a differential of 7 cents a ton between pick mining and machine mining; that is to say, the mining cost of a ton, pick mining, would be 60 cents at any point, and the price for machine mined coal would be 53 cents a ton; in other words, there is 7 cents a ton allowed to the mine owner for his investment in machines.

That figure does not represent his whole gain in Illinois, because the machine mines more lump coal, and there is more marketable coal than can be obtained by hand. In the Danville district, which is a basic point, the differential is 15 cents a ton. The price of pick mining is 60 cents, and the price of machine mining would be 50 cents. That is the differential. This difference in the State of Illinois results from the fact that in Indiana the whole State has a differential of 10 cents a ton on one type of machine, and 12½ cents a ton on another type of machine, on mine run coal. That is what we call a puncher machine, an old-type machine. There is a differential of 10 cents on one type of machine and of 12½ cents a ton on the other. The fact that Indiana is the keenest competitor of Danville made it necessary. In the State of Ohio the differential is wider than that. We have never been able to determine a differential for machine mining except in Illinois.

MR. THOMPSON. What effect has that had on the introduction of machinery?

MR. MITCHELL. That has increased the use of machinery, where they have had the widest differential. In Ohio practically all the coal is mined by machine, because there is a great advantage to the miner owner in the use of machines.

MR. THOMPSON. I understand that there is some question in the coal fields in reference to the method of paying. In some mines they pay on the run-of-mine ton basis, and in others on the screened-ton basis. What have you to say in reference to that?

MR. MITCHELL. From as long as I can remember there has been a desire on the part of the mine owners that all coal should be weighed and paid for on a mine-run basis. The question has caused, perhaps, more strikes than any other question in the mining industry. At the present time the State of Illinois pays entirely on a mine-run basis. That matter was determined by a strike in 1897, the strike which I alluded to in the beginning of my testimony. When

that strike had come to a close we miners were able to secure an agreement from the Illinois operators fixing a mine-run scale. In Indiana they have both systems. They have what they call the double-standard. The mine owner, at his own option, may prefer to pay either on the screened-coal basis or the mine-run basis; but having made his choice, he must stick to it. He can not alternate day by day. Of course, they pay what are considered equivalent prices.

In Ohio the miners operate on a screened-coal basis.

In Michigan they have an option, but they choose to operate on a screened-coal basis.

In nearly all the other fields outside of this central competitive field, coal is mined and paid for on a mine-run basis. In Pennsylvania, and practically all the Southern States and practically all the Western States, the coal is mined and paid for on a mine-run basis. "Mine run" means that the men receive pay for all the coal that they mine. "Screened coal" means that the coal, after it is mined, passes over a screen, which, by agreement, is determined to be 12 feet long, 6 feet wide, with a mesh between the bars of 1½ inches, and then the men get paid for what passes over the screen; but they are paid more, of course, for that screened coal than they are for the mine-run coal. However, that has been the source of great contention between the miners and the mine owners. The men are unanimous in their opinion that all coal should be bought and paid for on the mine-run basis. By that they do not propose to say to the mine owner that he can not screen the coal, but they do mean to say that he must weigh and pay for it before he screens it. He can do what he pleases with it afterwards.

Mr. THOMPSON. What is your opinion in regard to that?

Mr. MITCHELL. I am strongly in favor of the mine-run basis. I think that it is the only correct method of weighing and paying for coal.

Mr. THOMPSON. Is not that the trouble in the Ohio field to-day?

Mr. MITCHELL. Yes; that is the cause of the suspension of 50,000 men there now.

Mr. THOMPSON. Why do the operators object to that? Do you know?

Mr. MITCHELL. They say that the men are not so careful in mining their coal; that, for instance, say, the men would send out more screenings and more coal that would not be marketable, or coal which, if marketable, would command a less price if paid for all coal that they mined. They say if they mine on the screened-coal basis and are paid only for that part that goes over the screen they are likely to send out better coal that will not make so much screenings.

Mr. THOMPSON. Of course, you have given your opinion with regard to the main question, but I would like to ask you in regard to the last matter you spoke of: What is your opinion in regard to the carefulness of mining and its effect on the screened-coal basis?

Mr. MITCHELL. To be perfectly frank, I would say that among the unskilled employees, who are being employed in such large numbers in the mines, they are likely to be more careless on a mine-run basis than on the screened-coal basis. However, that is a matter that can be easily prevented. The mine owners have simply filled their mines with unskilled men. Coal mining should be a highly skilled trade, and there should be an apprenticeship system. A man should be trained to do the work well, just as he was when I learned my trade.

But now the mine owners employ the recently arrived immigrants, and it seems choose to have that kind of labor and to take the product that they get from it.

Mr. THOMPSON. There is some controversy, we understand, in regard to what is called the check-off system of collecting dues from the miners. Will you explain what the check off actually is in the mining field and what the controversy actually is?

Mr. MITCHELL. I think, Mr. Thompson, there is no real controversy about it. It is a matter that occasionally comes up in wages conferences simply as a matter of policy on the part of the mine owners. The check off means this, that the mine owners deduct from the miners' earnings each month the amount of their dues that the men are to pay to the union. That is to say, instead of having each man come forward and pay his own dues the mine owners deduct the amount of their dues from their wages and turn it over. That is the rule in the bituminous coal field. It is not the rule in the anthracite field. That arrangement was one that grew up in our industry as the result of circumstances. For instance, in some of our districts the men opposed that arrangement very much. They wanted to pay their own dues, they said. They adopted the policy that if some man came on the mine that had not paid his dues the 1st of the

month they said to him, "You ought to pay your dues. You are working under contract, and you ought to pay your dues. If you do not pay them, you can go home;" and if he did not go home, all the rest of the men went home. The mine owners said, "We want to obviate these disputes that grow out of differences between yourselves, and we make these deductions in other cases where money is paid to the organization," and the union insisting on every man living up to the contract, that inasmuch as the union was responsible for the contract every one must comply with its provisions, they asked the mine owners to assist them in avoiding the disputes by making these deductions from the pay of the miners. It is important to know that these are not the only deductions that are made, but, for instance, if a man buys goods in a company store the mine owner deducts it from his pay; or every miner must contribute to a blacksmith who is employed by the company; and if a miner buys powder from the company, as he must do, the company takes it out of the man's pay. So that the miners felt that it was not unreasonable, if they were going to take out of his pay all these other charges, and that they might as well take this charge for the dues to the union.

Mr. THOMPSON. Has that anything to do with the Colorado trouble?

Mr. MITCHELL. I think not.

Mr. THOMPSON. In general, I will ask you to state what, in your opinion, has been the effect of the agreements in both these fields on the miners and the operators and on the industry generally?

Mr. MITCHELL. To state that it would be necessary for me to explain what I regard as the fundamental question involved in this inquiry. Of course I regard that trade agreement—that is, the collective bargain between mine workers, mine workmen generally, and employers—as the most positive evidence of the interdependence of labor and capital; that it is a practical application of cooperation. The individual bargain leads inevitably to the demoralization of the workingmen, because the condition of the weakest man—that is, economically, the weakest man in the industry—is that which the average man must accept.

In my judgment there can be no permanent prosperity to the workingmen, there can be no permanent industrial peace, until the principle is firmly and fully established that in industrial life the settlements of wages, hours of labor, and all the important conditions of work, are made between the employers and the workingmen collectively and not between employers and workingmen individually. The individual workmen theoretically bargains with his employer as to the wages to be paid by his employer; but practically there is no bargaining. The individual workman must accept the wages and conditions of employment that are offered to him by his employer. It is a matter of no concern at all to an employer if one workingman refuses employment. He thinks nothing about it, because there is another workingman ready to take the job.

As a consequence of this system of individual bargaining, which is really nonunionism, the conditions of the best men in the industry are brought down, practically, to a level with those of the weakest men in the industry. Collective bargaining, of course, means that there shall be a uniform and minimum standard of wages and that there shall be uniform hours of labor. It seems to me that the effect of collective bargaining in the United States has made for righteous industrial peace. I think that of course every one in the country is interested in industrial peace, and they should be interested in righteous industrial peace. But I should say that it would be a misfortune if we should ever have industrial peace in America that was based upon the submission of the workmen; that if we are to have industrial peace, it must be predicated upon industrial righteousness. The workmen can not hope for industrial righteousness except as they secure it through their collective action.

I know that in the industry with which I am best acquainted, the coal industry, collective bargaining has not only increased tremendously the earnings of the mine workers, but what is perhaps of more importance it has given the whole mining population a different and a better view of life. That is, instead of being, as they once were, a hopeless, despondent people, whose labor brought them less than that upon which they could live decently, they have become hopeful people; they have got a different outlook; they regard this as "our country," a country in which they feel an interest, a country that means something to them.

Now, it has given them that feeling of justifiable independence; it has made them better men, better citizens, better fathers, given them better homes;

it has meant education for their children, and it has meant, in most cases, a provision for their old age.

As to the mine owner, of course, for him I hold no commission to speak, but I do know mine owners, and my own relations with them have been cordial and pleasant, and I accord them the highest regard. Many of them are my personal friends. I know their families, and they visit my home and know my family; so that I know enough of them, my relations with them have been so pleasant that I think I can say this in truth, that taken all together, the condition of the mine owners is better now than it was prior to the advent of the United Mine Workers of America. It is not what they would like it to be. I think I could sympathize with the desire of the mine owners to be permitted to organize. I think they should be permitted to organize; I mean, to organize so that they might control, within reason, the selling price of their product. I think that it would be an advantage to everyone if the mine owners might control, by agreement among themselves, the price at which their product should be sold in the market. I do not mean to suggest for a moment that they should be given absolute freedom to do as they please. I think they should be under the control of the Federal Government so that they might not charge extortionate prices; but it happens at this time—although this may not be the place to discuss it—that 40 per cent of all the coal is wasted; it is left in the mines, and that 40 per cent of coal will some day be a matter of most extreme importance to the people of the generations to come; and yet the mine owners can not take out that coal because they do not get a large enough price on the market to justify them in doing it. They mine only the coal that can be mined most cheaply.

Now, if they were permitted to charge better prices, they could pay better wages and save all this coal. But I think, nevertheless and notwithstanding that, that on the whole the condition of the mine owners is immeasurably better now than it was prior to the adoption of the collective-bargain system of conducting industry.

In the anthracite field I dare say that the miners are so much better off that they would not care to return to the old system. If the change in the market price at which the anthracite coal be sold is indicative, I would say that they are making tremendous profits; and if the newspaper reports of their dividends are correct, I would say that that would confirm the fact that they are making very large profits. However, the anthracite coal is very much different from the bituminous. There 95 per cent of the entire industry is practically in one control, while in the bituminous coal there is no such control.

Mr. THOMPSON. In your opinion, does the success of trade agreements in the coal fields depend upon organization on both sides?

Mr. MITCHELL. It depends absolutely on the organization of the workmen, and I think it would be helpful to it if there was organization of the employers. In some States there is organization of the coal operators. The Illinois operators have two associations, rival organizations; and in Indiana they have one organization. In Ohio I think they have several organizations. But the purpose of these organizations is not to control prices; it is purely for the purpose of conducting their business with the miners' union.

Mr. THOMPSON. It is particularly for conducting business under the trade agreements?

Mr. MITCHELL. It is just for the purpose of conducting the trade agreements.

Mr. THOMPSON. Referring to the method of settling controversies which arise between, say, individual miners and the various operators that we spoke about some time ago, are you acquainted with the English method of settling those differences?

Mr. MITCHELL. Their boards of conciliation?

Mr. THOMPSON. Yes.

Mr. MITCHELL. I know in a general way about it. I have studied some of them.

Mr. THOMPSON. How does that differ, and in what respect might it not be an improvement on the system in vogue here?

Mr. MITCHELL. I do not think that there is any essential difference in the system in England. I have looked into the matter in the north of England, and they have just what we have here, they have what they call a board of conciliation; but I do not know—I can not recall any system of arbitration that they have for the settlement of disputes that arise from time to time.

Mr. THOMPSON. Mr. Mitchell, they did have a system of apprenticeship, did they not, in the coal fields, which has been discontinued; and if so, why was it discontinued?

Mr. MITCHELL. There never was any system in regard to apprenticeship. Of course, in the early days the mining work was done altogether by English-speaking men, who had, most of them, been trained coal miners in some foreign country, either in England or Scotland or Wales; and they would not work with a man who had not served an apprenticeship. Unless a boy started as an apprentice with them, they would not work with him. It was not because there was any union to regulate it, but it was simply the practice of the miners of those countries, which rather was accepted in this country.

But now in some States, for instance, in Illinois, the law of the State provides that no one shall be actually permitted to mine coal as a miner unless he has had two years' experience. It is by law, therefore, a sort of apprenticeship; that is, a skilled miner may take an unskilled miner with him and teach him the trade. In the anthracite fields of Pennsylvania that also is the law. No one is permitted to work there under contract as a miner unless he shall have had two years' experience. But those are regulations made not by the union but by the law.

During the past 10 or 20 years, and especially during the past 10 years, the non-English-speaking labor has entered the mines to such an extent that practically one-half of all the men in the United States in the mining industry are non-English-speaking men.

Mr. THOMPSON. Do you think that these learners—apprentices—should be taught anything in the schools in regard to mining in addition to what they learn in the practical work?

Mr. MITCHELL. I think it would be a practical impossibility to give a teaching in school, except as they may learn something about gases. I think that that would be about the only thing they could learn in a school about mining. They might learn the nature of various gases, and, after all, that would not be so important to them.

Mr. THOMPSON. Do the conditions which exist in the contract field exist also in the fields where the union does not exist, and where there are no contracts; or what, in general, is the difference between the two fields, if you know?

Mr. MITCHELL. No; the conditions are not at all similar in the districts and States where the union is not established, and of course there is no contractual relation; I mean there is no collective bargaining in the nonunion fields. For instance, in nearly all the State of West Virginia, which is now the second coal-producing State in the United States, the men work under terms that are fixed by the mine owners absolutely, and that is true of a great many of the Southern States—of Alabama, parts of Tennessee, and parts of Kentucky—the mine owners fix the terms of employment as they do in most parts of Colorado and Utah and New Mexico, and in parts of Pennsylvania there is what we call the Westmoreland County, Pa., district, and in western Maryland the terms are entirely fixed by the mine owners. The wages in all of these districts that I speak of are much lower than they are in the fields where trade agreements are made, and the hours of labor are longer in the non-union fields.

Mr. THOMPSON. Do you think that if the National Government should establish an impartial industrial council for the purpose of these industrial questions that arise between capital and labor, a council to which both laborers and employers could appeal, such a council would meet with the approbation of the miners as a means that could help them settle questions which they are not able to agree upon with the operators; this is not to be a compulsory proposition, but one in which the council will be called upon to act as a mediator or conciliator?

Mr. MITCHELL. I am not at all sure that I can speak for the miners in regard to it. I do not know. I have never discussed the matter with them at any length, or with many of them at all. What I say on the subject shall have to be my own view as to the advisability of such a tribunal, and I will say at the very outset that perhaps my view is not at all in accord with the views of those who have been active in the trade-agreement movement. I think that the creation by the Federal Government of a tribunal having authority to investigate the causes of threatened strikes or lockouts, and the causes of strikes and lockouts that have occurred and are in progress, and having authority to give an expression of its opinion as to the merits and justification of the dispute, might be of great value. It would depend, of course, very largely upon the type of the

men who were members of the Federal board. If it were such a board, for instance, as the Interstate Commerce Commission, I mean composed of men who command the general confidence of the people as that tribunal does, of course upon it should be represented the workmen—the workmen should be fully represented—and if there was that limitation upon their authority; that is, that they should have no right to arbitrate a dispute unless called upon by both sides to do so, I think such a tribunal would be of value.

Of course there is some fear, that is often expressed, that if such a tribunal were created, and if some great industrial dispute were to arise and an investigation were made by this Federal tribunal and their conclusions were stated, were announced publicly, and if then it did not result in the settlement of the strike or lockout, that the Federal Government might go further and try to coerce the parties to a settlement, then that they might go as far as compulsory arbitration; and while I think there is perhaps not so much danger, while it is not consistent with our Federal Constitution, I do know that among the workmen of the United States there is a unanimous sentiment against compulsory arbitration, and I think perhaps that it is just as unanimous among the operators; that neither side would want it.

Mr. THOMPSON. I have asked all the questions that I wish to ask the witness.

Mr. BALLARD. Mr. Mitchell, why was the sliding scale abolished in the anthracite regions of the United States in 1912?

Mr. MITCHELL. It was, I think, because of the difficulty of increasing wages and maintaining the sliding scale. It is very difficult to determine what the sliding scale should be if wages were advanced. For instance, when coal was \$1.45 in New York Harbor, for each cent which is added at tidewater, I think there is 1 per cent advance in the wages. Now, if they advanced wages 10 per cent, for instance, it was very difficult to determine how the sliding scale should be based.

I think the men feel that they would rather have a definite scale than a scale based upon the fluctuations in the selling price of coal. While there was only a running period of six years it only varied 4.6 per cent, indicating that in the advance in wages the men were very well satisfied.

Mr. BARNETT. Have you had any experience with any other sliding scales in the coal regions?

Mr. MITCHELL. No; we have never had in the bituminous field. I know the history of it in the anthracite field prior to my taking charge of the miners' organization there. Of course, under the old system there was no minimum, and the result was that the men worked for very much less than the base price and were always receiving less than the base instead of more.

Mr. BARNETT. So, that on the whole, you would prefer a system of agreements for a definite period rather than a sliding scale? Do you regard that as practicable?

Mr. MITCHELL. Yes; I do.

Mr. BARNETT. You spoke with reference to the movement of men in the bituminous field; that was some movement on account of differences in wages? Is there any recognized drift from one part of the field to the other; that is, are wages so high in one part of the field that the men move to that? In other words, is there any current, aside from the movement from mine to mine? That is, in any of these districts are the wages lower than the other districts?

Mr. MITCHELL. Yes; in some districts, of course, the wages are well known to be less and the possible earnings, because of thin veins and the expense of mining. But this movement is spasmodic. For instance, one district may have a good run during the summer months and another might not be doing so much, and there would be large numbers of men attracted to that particular field on account of reports of high earnings, and there will be a steady movement into that district. But, as I say, the movement is characteristic of miners, not only of coal miners but metalliferous miners, they move more frequently than men employed in other industries.

Mr. BARNETT. Could you say whether men move from Illinois to Indiana or from the Pittsburgh district to the Illinois district? Is there any definite current or drift?

Mr. MITCHELL. A movement back and forth?

Mr. BARNETT. There is no movement in one direction, a movement from Illinois to Indiana, or vice versa?

Mr. MITCHELL. No; there are very large movements from northern to southern Illinois, say; that is because the wages were higher than in the northern

district; and, of course, where there is a new coal field developed there is a large movement of the men to that new camp.

Mr. BARNETT. You said that the operators preferred to hire the immigrants—"unskilled labor," I think was your expression—rather than skilled men, and that the loss of coal was due to that practice, if I understood you; am I correct in that?

Mr. MITCHELL. No; I did not say they preferred to do it; I did not say that they preferred unskilled labor in preference to skilled men. I did say that they have employed and are employing large numbers of unskilled immigrant workers, but I do not know that they have refused employment—in fact, I am sure that they have not refused employment to skilled workers; but, as you know, the mines of the United States operate on an average about 200 days a year, so that as a matter of fact there are employed in the coal industry one-third more workmen than are required to produce the amount of coal consumed in the United States, or which is brought in in any one year. If the mines, with one-third less force, were operated every day in the year they would get out as much coal as they do now operating 200 days a year with the force they have.

Mr. BARNETT. Then it would amount to this, that the wages paid, according to your opinion, in the mines at the present time, considering the loss in days, is not sufficiently attractive to induce skilled men, the class of men that would be careful in mining, to enter that employment?

Mr. MITCHELL. I think not. I think the fact of the irregular work and the danger of work in mines has resulted in the fact that the sons of English-speaking men are seeking to find employment in other fields, they are giving up mining, and many of these English-speaking miners have left the mines and gone to other fields, partly because they wanted to work outside in the fresh air and partly because mining is an extremely dangerous operation, and because it is irregular. The best they can expect is from 200 up to never to exceed 220 days average employment in the year, and sometimes in some of the States very much less than that. I have known of some mines in Illinois in which there have been only 175 days' works a year.

Mr. BARNETT. I notice that the ton rate in the Hocking Valley district has increased from 45 cents in 1897 to \$1 at the present time. Has that increase in the rate been commensurate with the increase in earnings? Have the earnings doubled?

Mr. MITCHELL. No; I think not. That would seem to be the case that the wages have increased about 120 per cent, but, as a matter of fact, machines have been introduced, and, of course, the machine rate is very much lower than that, so that, as a matter of fact, there has been a very large increase in the earning power of the men and their earnings, but it has not been the difference of 120 per cent in earnings, even though the scale for pick mining has increased 120 per cent.

Mr. BARNETT. How would the earnings of the machine miner compare with those of the hand man or the pick man?

Mr. MITCHELL. Well, about the same, I dare say, but that would not mean, of course, that he had increased his wages the difference between 45 cents a ton and \$1 a ton, because the machine-mining scale in Ohio originally, I think, was five-sevenths of the pick mine price, and as the machine took the place of the pick mining that probably means that the pick miner—there are very few pick miners—but it probably means that the pick miner earns about the same amount of wages.

Mr. BARNETT. Do you regard the differential allowed the machine as based chiefly on the difference between the product or upon the cost of getting it out?

Mr. MITCHELL. In Illinois, where they have an arbitrary differential of 7 cents a ton, I think there it enables the mine owner to produce his machine-mined coal at a little better price than the pick coal, and he gets a better grade of coal. In other States, I think, the mine owner has an undue advantage. I think the difference in cost between pick coal and machine-mined coal is not equitable; I think there should be a less differential. I think the Illinois differential is about the correct one—7 cents on the run-of-mine coal or screen coal.

Mr. BARNETT. What do you mean by saying it is inequitable, from what standpoint? That the man can make about the same earnings, or that it puts the coal on the same basis?

Mr. MITCHELL. Both. I think it enables the workman to make about the same amount of wages with the same effort, and it allows the mine owner a

fair return on his investment. I think it is a profitable investment at 7 cents a ton. For instance, I do know mine owners who on their own account operate machines with a differential of only 4 cents a ton.

THE ACTING CHAIRMAN. Mr. Weinstock, any questions?

Commissioner WEINSTOCK. You were saying that you do not regard the present system of settling disputes as perfect; in other words, it is not the best conceivable system; but is it the best possible system?

Mr. MITCHELL. Well, it has been the best system that we were able to devise, and in practice it seems to do better than anything else that we have attempted. I have, as I have already stated, tried several systems, and the system that we now have seems to operate better than those that I have experimented with.

Mr. WEINSTOCK. I presume that the question of trade agreements, then, is not a perfected science, but simply a progressive science?

Mr. MITCHELL. Yes; I think that is quite true.

Mr. WEINSTOCK. And you believe it is possible that we have not reached the highest possibility yet, that it will be possible to improve the system of entering into agreements, so as to further minimize possible friction?

Mr. MITCHELL. I think it would be possible; and it is probable that experience will demonstrate the advisability of new machinery for the operation of agreements. Of course, the agreements themselves will be regarded as fundamental. I mean the principle is fundamental, but I take it that experience will demonstrate the advisability of providing agencies through which the agreements may be operated with less friction.

Mr. WEINSTOCK. It has been brought out in the discussion here that since 1897 wages have increased about 122 per cent, or that the cost per ton has increased 122 per cent, and that the working hours have been decreased 20 per cent.

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. That is, from 10 hours to 8.

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. How has that been equalized? Has that come out of the pockets of the owners or has it been added on to the consumer?

Mr. MITCHELL. I think that the scale would not justify the interpretation that the earnings have been increased 122 per cent.

Mr. WEINSTOCK. No; I realize that—that the earnings have not been increased 122 per cent—but the cost of producing has been increased 122 per cent—that is, here formerly it cost 45 cents a ton to mine, it now costs \$1 a ton to mine; the worker may not get the full difference between 45 cents and a dollar—but it costs that much more to produce the coal.

Mr. MITCHELL. No; not necessarily. For instance, the introduction of machinery has taken the place of hand labor; the miners have been equipped in many ways to reduce costs, equipment has been put in for protection. For instance, there are large mines which formerly produced a thousand tons of coal that now produce 2,000 tons. There has been that tremendous saving in cost there, but the mine owners have not received 122 per cent advance on the selling price of the coal. They have received a considerable advance, but whereas—the Hocking Valley in 1897—there the mining price, as I show on our scale, was 45 cents in 1896, but the selling price at that time f. o. b. cars, mines, was 85 cents a ton. That means all kinds of coal, mine-run coal, whereas in 1912 the mining price was \$1 a ton and the selling price of coal f. o. b. was \$1.15 a ton.

Now, of course, that would seem to indicate that the mine owners had tremendous profit when they got 85 cents a ton and paid 45 cents, or that they must receive a very small profit now when they pay \$1 a ton and sell coal for \$1.15; but as a matter of fact that was a screened-coal scale; they really do not pay \$1 a ton. They pay \$1 a ton for screened coal, but 40 per cent of all the coal may pass through the screens, and the mine owners sell this 40 per cent as well as the 60 per cent; therefore, in order to get at the facts about it you would have to reduce this screened-coal price to the mine-run basis, which would be probably 60 per cent of the screen-coal price would be mine-run price, and if the screen coal was \$1 a ton in wages, mine run would be 60 cents. Now, of course, if they pay 60 cents for mine-run coal and sell that for \$1.15 it explains in part what seems to be discrepancy.

Mr. WEINSTOCK. Can you say approximately what has been the increase in the earnings of miners since 1897?

Mr. MITCHELL. I can not give that just offhand; I have no statistics, there are none available, but I dare say in many of the districts the miners now receive 75 per cent more wages than they received in 1896 and prior to that time.

Mr. WEINSTOCK. That is, a miner that earned \$1 a day in 1897 would earn \$1.75 to-day, in that ratio?

Mr. MITCHELL. I think so; I should judge that the average wages of miners in 1896 did not exceed \$400.

Mr. WEINSTOCK. A year?

Mr. MITCHELL. A year.

Mr. WEINSTOCK. And to-day it would be 75 per cent more; that would be about \$675 a year.

Mr. MITCHELL. Yes. I think that would be about right. I would like to make this qualification—of course, I could give you the figures if I thought about it—I think that the mines in 1896 operated more days in the year than they do now, and there must be some allowance for my estimate in regard to that, based on a less number of days.

Mr. WEINSTOCK. Can you approximate it in any way? At the present time I gather that the average is about 200 working days in the year.

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. Will you state approximately what they operated at that period?

Mr. MITCHELL. No; but I could supply you with that. I see the statistician of the Geological Survey right here, and he can probably tell you right offhand what that is.

Mr. PARKER (statistician of the Geological Survey). No; I could not tell that offhand.

Mr. WEINSTOCK. Has the daily output per diem been increased since 1897?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. Has he a higher efficiency?

Mr. MITCHELL. Yes; there has been a considerable increase in the output per man per working day; that is in part accounted for by the introduction of the machines, and in part accounted for by greater efficiency due to higher wages.

Mr. WEINSTOCK. Do the miners object to the introduction of labor-saving machines in the mines?

Mr. MITCHELL. That depends entirely upon the basis upon which they are introduced; in the district where the differential is so wide that it is a disadvantage to the miner, they would prefer not to have it, whereas in Illinois, with a differential of 7 cents a ton, a good many would prefer to have the machines. As I say, in the last 10 years the unskilled man could not probably work with a pick anyhow, and if he works behind a machine he simply shovels the coal, and the skilled man runs the machine.

Mr. WEINSTOCK. How seriously has the introduction of machinery reduced the number of men employed?

Mr. MITCHELL. You can not estimate it, except as you may say, how much greater would have been the increase in the number of men. There has been approximately an increase of 20 per cent of men in the mines of the United States in the last 10 years, it has been an increase of about 20,000 a year.

Mr. WEINSTOCK. Twenty thousand a year?

Mr. MITCHELL. About 20,000.

Mr. WEINSTOCK. Then in the last 10 years the number of men has increased approximately 200,000?

Mr. MITCHELL. I think that is about right. I may be mistaken in those figures. There may have been some years in which there was no increase, but in looking it up it shows an increase of 20 per cent in various years.

Mr. WEINSTOCK. Is that due to increased operation—opening many more coal mines?

Mr. MITCHELL. There has been a great many mines opened, but I think that has been due to the fact that the immigrant laborers come into the mines and write letters home to the fellows in the country from which they came and induce them to come here, and the immigrants have been attracted to the mining industry. I think it is by their fellow immigrants who preceded them here.

Mr. WEINSTOCK. Has the demand for coal kept pace with the increased production, and has not the use of oil for fuel interfered?

Mr. MITCHELL. It has interfered in many States. For instance, many of the roads running from Kansas City west have used oil for fuel instead of coal, notwithstanding that there has been a progressive increase in the production of coal. In some years it has gone back—in years of great industrial activity the consumption of coal would be greater than in following years—but in any

period of three or four years it shows a very large increase; the per capita production of coal in the United States has increased tremendously.

Mr. WEINSTOCK. The annual increased earnings of miners have been material since 1897, but has the cost of living increased more or less in proportion with these increased earnings, so far as you know?

Mr. MITCHELL. There is not any doubt in my mind that the earnings have increased to a greater extent than the cost of living has increased; I mean, if you base it purely on what his money would buy. I do not mean by that to say that miners have a surplus left at the end of the year, because their desires have increased proportionately with their wages; the things they buy now are things that they would not think of buying 10 years ago.

Mr. WEINSTOCK. If a miner had precisely the same standard of living to-day that he had in 1897, I presume he could save more than he could in 1897.

Mr. MITCHELL. Oh, yes; of course. There is no doubt about it. There can be no question about it. The miner is so much better off now than he was in 1897 that there is no basis of comparison. He is simply beyond calculation better off; better off in every way.

Mr. WEINSTOCK. That increase of earning power has increased his standard of living?

Mr. MITCHELL. I do not mean to say that he is the best off, for he is not. Coal miners ought to be among the highest paid workmen in America.

Mr. WEINSTOCK. You explained that under existing agreements the employers deduct from the wage the union dues?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. Does that mean that all mines employing union men are closed shops?

Mr. MITCHELL. Yes; that is, they are union shops.

Mr. WEINSTOCK. Nonunion men are not employed there?

Mr. MITCHELL. Any man applying for employment may be given work without a protest, but he afterwards automatically comes into the union.

Mr. WEINSTOCK. And if he refuses to pay his dues he can not be employed?

Mr. MITCHELL. No.

Mr. WEINSTOCK. So that it is practically a closed shop?

Mr. MITCHELL. We always use the term union shop.

Mr. WEINSTOCK. In California we speak of it as the closed and the open shop. Now, you were speaking of cutthroat competition, and that under this agreement arrangement it has minimized the cutthroat competition between mine owners?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. If it is illegal for owners to agree upon prices under the Sherman Act, how does that prevent cutthroat competition?

Mr. MITCHELL. That did not prevent it; unfortunately they still have it.

Mr. WEINSTOCK. Cutthroat competition?

Mr. MITCHELL. Cutthroat competition, but not to the same extent. I might illustrate: Prior to the advent of these United Mine Workers of America, and prior to the establishment of these trade agreements it was not unusual for a mine owner to go to his employees, and say, "Here, I can get a contract for, say, a thousand tons a day, and that would operate this mine every day in the year, but I will have to take it at 10 cents a ton less than is paid by the man that has it now. If you men will accept 10 cents reduction in the mining price, I will take the contract." The men sometimes agree to do that, and at other times they are compelled to do it. Then the mine owner will go out and take the contract, and the mine owner from whom he took the contract would say to his men, "The contract is gone, and I can not operate the mine at all unless I have a corresponding reduction in wages, and as a matter of fact if I take a contract like that I must have a greater reduction."

Now, there is the character of competition that has been entirely eliminated by the trade agreements. All competition for trade now is not based upon the payment of low wages; that is, each mine owner knows at any rate that he has a certain wage cost, and if he is able to take a contract from his neighbor now he either does it at less profit or no profit, or because of superiority of management.

Mr. WEINSTOCK. In other words formerly a cut in price was squeezed out of labor?

Mr. MITCHELL. Absolutely.

Mr. WEINSTOCK. Now, all union employees start out on an even basis as far as wages are concerned?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. And the unfair employer has no advantage now over the fair employer, as far as his labor cost is concerned?

Mr. MITCHELL. As far as his labor cost is concerned, no.

Mr. WEINSTOCK. So that while the trade agreement may not have prevented cutthroat competition in the way of profits it has prevented it in the way of wages to labor?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. You say that organized labor is almost united as being opposed to compulsory arbitration in America?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. What about compulsory inquiries like they have in Canada?

Mr. MITCHELL. I think I should look with disfavor upon it simply because I regard it as having been a failure in Canada. I think that the Canadian system has not been of any value in the larger industries. I know what is said about it, and they point to hundreds of strikes avoided, agreements made, and so on, but it is usually in the small industries.

For instance, I know in my trade, in mining, where a dispute arose in the Crow's Nest Pass district of Alberta, in which several thousand men were involved, that the Canadian Government sent out representatives there to mediate, and failing, said that the law should be obeyed, and that the men should not strike, and the men said, "We will not strike." Well, it would be very easy for the Government to have arrested a dozen men in some industry, but a question of putting in prison or fining perhaps 2,000 men, that was a different proposition, because the nonpayment of fines would mean prison, and the Canadian Government decided not to go any further in the matter, nor to take any drastic action.

That was also true in Nova Scotia and true in some other districts in Canada, so that I think the Canadian system is repulsive; there is a compulsory process to the Canadian system that is repulsive to the workmen.

I think the Lamoe Act of Canada has not been a success, notwithstanding all the claims that have been made for it. In attempting to demonstrate the success of that system attention has been called to the fact that we in America have disputes and strikes, and that they have avoided them in Canada; but if you compare in the United States the number of disputes that were avoided by direct negotiation between employers and workmen, if you compare the number of trade agreements in existence in the United States as against the number of disputes averted in Canada through the intervention of the Government, I think you will find that we have been equally as successful as they have been in Canada. If you make that contrast—and I should say that that would be the only proper way to do it—I think we have been as successful as they have been, and we have not had the disadvantages that they have labored under.

Mr. WEINSTOCK. As I understand it, the Canadian act is confined to public utilities. Are coal mines considered in Canada as public utilities?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. They come under the public-utilities act?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. But they are not owned by the Government?

Mr. MITCHELL. Yes; I think the ownership of all the coal in Canada is vested in the Government.

Mr. WEINSTOCK. The Newlands Act of the United States, which followed after the Erdman Act in dealing with railroad disputes, as I understand it, is practically the Canadian act, except that it is not compulsory?

Mr. MITCHELL. Yes; I understand so.

Mr. WEINSTOCK. Do you regard that with more favor than the Canadian act?

Mr. MITCHELL. Very much more; because the element of compulsion is not there.

Mr. WEINSTOCK. Under the Canadian act, as I understand it, labor can not strike and employers can not lock out until there has been first a public inquiry on the part of the Government; and the inquiry having been made and recommendations submitted, they are part of the inquiry and can be accepted or rejected; and if rejected, then the strike can legally take place, and a lockout can legally take place?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. Now, under the Newlands Act, as I understand it, the workers are at liberty to strike before there is an investigation?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. And the employers are at liberty to lock out before there is an investigation?

Mr. MITCHELL. Yes.

Mr. WEINSTOCK. The difference between the two systems is this: That in Canada the inquiry must be before there is cessation of work, and in the United States there has to be an inquiry either before or after the cessation of work?

Mr. MITCHELL. Yes; and, of course, there are no penalties here, and there are there.

Mr. WEINSTOCK. In your opinion the American act is the preferred act?

Mr. MITCHELL. By far. As soon as the element of compulsion enters, that of course arouses the hostility of the workman, and I think it would of the employer, too. The fact that in Canada men may be fined for failure to observe the act and may be sent to prison—because, of course, if the men refuse to pay their fines there must be some way of enforcing it, which means prison—and in America the men feel that there should be no direct or indirect process by which a penalty could be imposed on the man who gives up his work; in other words, that it is a species of involuntary servitude, which is repugnant to the law of the land, and that the right to quit work rests with himself, except this: Of course no American workman claims that he has the right to violate his contract, and he regards it as no hardship at all if his union should say, "You must observe the terms of your contract and remain at work."

Mr. WEINSTOCK. In other words, then, the union man is placed in this position: That there are times when he may want to work, and the union says, "You shall not work," and he must refrain from working, and under the Canadian act he may be compelled to work when he does not want to work; so the situation is reversed.

Mr. MITCHELL. Well, there are times, of course, when individual workmen may disagree with the decisions of their unions, and when the union has decided to strike; I do not doubt that at all, but I think they make a contrast in which there are like principles involved. For instance, in a case in Canada a man may want to strike because he may believe that he can secure better conditions through a strike than he could through the mediation of the Dominion Government, and as a matter of fact strikes sometimes change market conditions. For instance, I have not the slightest doubt in the world that in 1897 when the coal miners of the United States went on strike that they struck for wages that the operators could not afford to pay them. I do not think the operators could have paid them more wages unless they had created a new market. In other words, the miners struck not against the operators, they struck against the market; they struck to try to regulate competition sufficiently so that the mine owners could get prices for their products that would enable them to pay wages to the men. Now, of course, in taking that instance any arbitration undertaken at that time would have resulted in the men being defeated, because the mine operator could not pay wages unless he made profit. I mean the wages of the workmen and the dividends of the employer must come out of the earnings of the industry.

Commissioner DELANO. You have stated that one of the results of these trade agreements in the coal industry has been to bring about industrial peace, and that is one of the objects of our investigation, the investigation by this commission. From my point of view, as representing an industry that has to be a large consumer of coal, my observation is that we have a strike about every two years, a cessation of production of coal which puts all consumers to very large expense. We are looking for industrial peace, but that does not seem quite to conform to my notion of what industrial peace is, if we are going to have a war every two years; what is the answer to that?

Mr. MITCHELL. I think you are mistaken as to there being a strike every two years. Of course I am speaking of the term covered by trade agreements. For instance, the trade agreements in the bituminous-coal industry—I take it you refer to that?

Mr. DELANO. Yes.

Mr. MITCHELL. The first one was made in January, 1898, following the strike of 1897. Now, the agreement made in 1898 at the Chicago conference continued without interruption at all, and I think without stoppage of work. In 1900 the agreement was made without suspension of work, and in 1901 again there was no suspension of work. I think the first suspension of work occurred in 1904, and that lasted for a period of six weeks, when the agreement was made. In 1906 again there was a suspension of work for a short time. It is

true that there have been periods during the last 16 years when the miners and mine owners have failed to reach their agreements on the 1st of April, when they expire. There have been short suspensions, but usually they have got together shortly thereafter.

I could not very well attempt to fix the responsibility for that, but there is a peculiar situation in that a good many miners have previous to suspensions—for instance, if a man were a dealer in coal in a large city he might very well profit immensely from a suspension of work on the 1st day of April, the day of the expiration of the agreement, for if he had many thousands of tons in stock he would sell it at a much higher price than otherwise. And I know that the railroads have been disturbed by the fact that they fear a suspension, even though it did not occur; they could not permit themselves to be without fuel, and they have probably stocked up by the 1st of April, so that if the suspension occurred they still would have enough coal to run the railroad. That I regard as a serious matter, and it is one that I regret, too.

Mr. DELANO. And that would apply to any public-service company, such as a gas company or an electric company or a water company or street car company?

Mr. MITCHELL. Yes; I think that those of 1904 and 1906, thought. I think those are the only times during my connection with the organization that there were suspensions on the 1st of April.

Commissioner DELANO. Was it not again in 1908 and 1910?

Mr. MITCHELL. I think in 1908—that was the year of my retirement—I think there was for about three days, because as soon as I got out of office—and, by the way, the suspension would not have occurred, had it not been for the fact of an agreement to let my successor make the agreement—the agreement expired on the 1st of April, and the conference convened at Toledo on the 4th of April, and the agreement was immediately made.

Commissioner DELANO. I do not want you to think that my question is in criticism.

Mr. MITCHELL. No; I understand that.

Commissioner DELANO. But we are groping, we are trying to find some scheme that will bring about industrial peace. Now, it seems to me that if those who are dependent upon an industry do not know that there is industrial peace, or that there is any machinery to produce industrial peace, those who are dependent upon that industry feel that very seriously. My familiarity with this question is simply from that standpoint. Now, take the 1st of April, just a few days ago, there was not a single person in the Middle West dependent on the coal industry that knew whether the coal industry would continue or whether it would cease, or whether it would cease for one month or for two months. Everyone who is absolutely dependent on coal to continue the services that they are rendering had to be forehanded enough to buy 30 or 60 days' or more, according to how his judgment directed. That seems to indicate some policy or something wrong in the nature of the trade agreement.

Mr. MITCHELL. Well, of course one way to provide against it would be to have trade agreements covering a longer period; that is to say, it would lessen that. Of course, in the mining industry we have attempted to make the agreement for two years instead of one as formerly, and in the anthracite four years instead of two. In the southwestern district we attempted to meet that by providing that if the agreement is not negotiated by the 1st of April, the day that the agreement expires, that the men shall continue at work for another period of 30 days while further attempts are being made to negotiate the agreement.

Now, of course such an agreement as this in the southwest has its disadvantages to the workingmen and they do not like it. For instance, if provision is made for workingmen, coal miners, to continue after the expiration of the agreement all the advantage is with the employers, because it means that they can pile up coal and defeat the men in a strike that may follow.

I recognize, however, the merit of what you say about that, that the railroads are put to a great deal of inconvenience on the approach of the expiration of each agreement, because they do not know that work is to be continued, and yet in experience and in practice the difficulty has not been so serious as was feared; for instance, I dare say that in railroad service all the transportation men would have the right to stop work at the end of their agreement, and yet they do go on negotiating notwithstanding the fact that they have the right to stop.

Commissioner DELANO. In that respect apparently the railroads, in their trade agreements, have been able to work out a system that does not involve

cessation, and, of course, cessation would not be tolerated by the public in the case of a railroad.

Mr. MITCHELL. No.

Commissioner DELANO. But it is tolerated in the case of operating mines.

Mr. MITCHELL. Yes. I presume it would not be tolerated in the mining industry either if it were not possible to load up coal to meet just these contingencies. Of course, with the capacity of the mines one-third greater than the possible consumption of coal it is not difficult for industries to provide even for three or six months' supply of coal, and I think the railroads have sometimes provided for as much as six months' fuel.

The ACTING CHAIRMAN. Mr. Lennon, any questions?

Commissioner LENNON. Have you in your general experience found any possibility of a trade agreement without organization on both sides to some extent or must there be special interest on the side of the workmen?

Mr. MITCHELL. No; I think that would be impossible. In other words, I think the trade agreement presupposes the organization of the workers, and I think the trade agreements are better made where the employers are also recognized.

Commissioner LENNON. I want to ask a question or two on a subject that was started by our friend Mr. Thompson, as to the matter of education, the possibility of the miners receiving, through the aid of the State or through vocational education, a better knowledge of the dangers of dust and gas formation, and necessarily a knowledge of the composition of coal. Is there not a possibility of that being done to the advantage of the miners?

Mr. MITCHELL. Well, I think to a less extent than any other industry in the United States. To begin with, industrial training to be successful must have—I think we must be able to get some practical demonstration, and of course that is impossible. I think, however, the knowledge of gases would be of value, and I think perhaps the knowledge of insanitation, insanitary conditions, or ventilation, that knowledge would be of value to the miner, particularly a knowledge of ventilation; but I do not think there is much value to his knowledge of the composition of coal; I do not think that would make him a better miner at all.

Commissioner LENNON. How would you apply the matter to the miner's children. Suppose the boy, under the law, is permitted to enter the mine and is brought out to go to school, would that be likely to improve the men?

Mr. MITCHELL. I think that would be of very great value, if we could have the advantages of academic training or classical training, but I do not think the workmen would get a trade training in school.

Commissioner LENNON. Well, neither do I. What has been your observation among the miners as to their being law-abiding citizens at this time compared to what they were 20 or 25 years ago? Do you see any difference?

Mr. MITCHELL. Yes; I think there has been a marked improvement in the whole moral life of the miners. For instance, I do not know whether it is general among the workmen, but I think it may be said among miners—for instance, take as to drink—it was quite a common thing in my day that a miner who did not drink was not regarded as much of a miner; you were not looked upon as being a very strong man; but now there is very little, there is comparatively little drinking among the miners. In fact, in some States—I know, that every coal county in Ohio went dry—where the miners had the majority of the votes the saloons were voted out of the county. Since then some of the saloons have been allowed to come back, but in southwestern Illinois every mining town is practically a dry town, and in some cases the miners compose 90 per cent of the voting population.

I do not care to discuss the question of wet and dry, but it is indicative of the sentiment that exists among the men, and I think that the improvement in the morale and the spiritual life of the miners has been proportionate with his increase in wages and the reduction of his hours of labor. When he worked a minimum of 10 hours a day and even much more than that—when I was a boy a miner went in at 3 o'clock in the morning and quit at 7 o'clock at night—when he worked tremendously long hours for very low wages, he had a different outlook upon life altogether from what he has now; so I say it has made a wonderful change in the miners themselves.

Commissioner LENNON. Do you know whether any of the districts could furnish the commission with accurate data as to the cessation of work under agreement, and as to the number of cases where the men were to blame and

the number of cases where the operators were to blame; can you furnish us with any information on that?

Mr. MITCHELL. I should say in Illinois, and perhaps in Indiana, they could furnish you absolutely accurate data of the number of disputes and the decisions in regard to them, for they have a joint organization for that very purpose, and it might include not only the number of disputes but the responsibility for them that caused the stoppages.

Commissioner O'CONNELL. You said that the men formerly worked 10 hours long, and now they work 8. Is it your experience that where laborers work continuously, maintain continuous work, that they can handle as much tonnage in 8 hours as they formerly did in 10? Did the men make as large an output?

Mr. MITCHELL. There is no question about that. Reports which are available of the United States Geological Survey on coal production have tabulated in them a statement of the output per man per working day, and it shows clearly that the output per man per working day is greater now than it was when a man worked 10 hours a day. I explained a while ago that it is in part accounted for by the fact that machines have been introduced, and it is in part accounted for by the fact that the men can actually do more work by working 8 hours than they formerly did at 10. That is particularly true with mining, where, of course, under the best conditions, the ventilation is not what it is outside; the air is not pure; it is vitiated.

Commissioner LENNON. You spoke of the regular work, that the men worked on an average of about 200 to 225 days in the year, and formerly they made more days per year. Is that because the mines themselves closed down, or because the working men receive a larger percentage and have not the same incentive to work that they formerly had?

Mr. MITCHELL. No; it is due to the fact that the production all over the United States is far beyond the possible consumption of coal. For instance, the mines in the United States produce now about 200,000,000 tons of coal a year, I think something like that—I am sorry I can not give you the figures right off—whereas, if they have a capacity of one-third more than that, I do not mean to say that if they worked every day they would actually get one-third more, because there are stops that must be made for repairs, but there are so many mines in the United States that there is not more than two-thirds—

Commissioner LENNON. So that the mines close down?

Mr. MITCHELL. Yes; the mine owner closes down, the mine only having an opportunity to work two-thirds of the time.

Commissioner LENNON. You said the United Mine Workers of America have control of many of these mines; do they handle only union made goods, or do the United Mine Workers of America, as union men, handle goods of any kind, or of any quality?

Do they say to the mine owners that they must buy tools and machinery made in union factories, and oil and powder, and materials made in union factories, or do they use whatever is given to them to use?

Mr. MITCHELL. They have no system as to what they say to the mine owner about it. The mine owners, as a rule, try to secure in the stores where they make their purchases union made goods, and if they see union made goods with union label on they will buy them and no others, but as far as their relations with the mine owners are concerned, there is nothing said about it. For instance, most of the powder is bought by the miners and is made by nonunion men.

It so happens that there is very little powder made by union men in the United States, and what little there is manufactured, they ask the mine owner to sell to them, and under an agreement with the mine owner, they jointly determine the character of powder to be used; it is determined by test, as to the value of the powder itself, and the men agree to buy it from the company and pay \$1.75 a keg for it, and it costs the company something like \$1.10, so that it is a very profitable arrangement for the mine owner to have his miners buy from him under that arrangement.

Commissioner O'CONNELL. Then the mine workers do not do as some other men do—refuse to work with nonunion tools?

Mr. MITCHELL. Very little of that comes to the mines. Most of that which is used is union.

Commissioner O'CONNELL. They do not discriminate?

Mr. MITCHELL. I think they would try their very best to have the mine owners buy union material. Of course, the miner does not have to buy that

unless he wants to; he can go and buy it anywhere. The mine owner does not furnish the tools. Of course, that is true as to these great mining machines, and I do not know that there is any of them made by union labor, so that there is no cause for dispute there, but if there was a dispute and there were machines made by union labor I suppose the miner would have the mine owner buy machines made by union men.

Commissioner O'CONNELL. What effect has the agreement had upon the protection of life and prevention of accidents?

Mr. MITCHELL. That is a most difficult question to answer. As a matter of fact, the ratio of accidents in mines has increased progressively, except in the last few years, when there has been an effort on the part of the Federal Government to increase safety, and it has had a measure of success, and promises to develop largely in the future. But, of course, these unskilled men come into the mines, and most of them never have heard of a coal mine, let alone work in one, before they came here, and that has increased, of course, the number of accidents. What the ratio would have been if there were no miners' union we can only conjecture, but I think it would be safe to say that if it had not been for the efforts of the miners' union the ratio of accidents would have doubled with the employment of unskilled men. Of course, with mining legislation—and in most of the States there is very good legislation—and I think that has been the result of efforts of the miners' union; the States have responded to the efforts of the miners' union, and they have enacted pretty good mining laws. That is not true in the States where the men are not organized. There is very little legislation and a very lax enforcement of mining laws in States where there are no miners' unions.

For instance, if I might explain, in West Virginia for a number of years I compiled statistics for my own use—they killed an average of six men per thousand employed; in Illinois they killed an average of less than three per thousand employed annually. West Virginia is a nonunion State. In Colorado, where they are nonunion, they killed on an average about seven; in Missouri, also nonunion, they killed less than one employee annually. In Alabama, nonunion, the average number killed in one year went up to 12. Of course, that was caused by an explosion, and was not typical, but the average for Alabama is from five to six per thousand employed, whereas the average of the union States runs about two per thousand employed. Just as the miners' union increased its membership there was a diminution in the proportion of accidents. You can follow the mining industry; if you were to chart it and take the thoroughly union States, the partially union organized States, and the wholly unorganized States, you will find the proportion of accidents going down as you go from nonunion to union fields, and it gets tremendously high in nonunion States and tremendously low in the union States. Unfortunately, in the best organized State in this country the accident rate is twice as much as it is in other districts.

Commissioner O'CONNELL. Then it would be fairly good insurance for a man to join unions in nonunion States?

Mr. MITCHELL. Yes.

Commissioner O'CONNELL. In regard to suspension of work, in your experience was the suspension greater before the time of the agreement than it has been under the present system of agreement?

Mr. MITCHELL. I do not know what the local situation was, in the absence of documents and the absence of any information, but I should say the strikes were confined to small territories, whereas now it usually involves a very large number of men. I do not know what the relative number of local strikes would be, but I would say that it would be less than without the trade agreement.

Commissioner O'CONNELL. And the shortening of the hours? I suppose you have heard the same as others; in shortening the hours men are likely to spend their leisure time carelessly or indifferently, and not for their own best interests? What experience have you had with miners as to the reduction of their hours? Do you find that the time is ill spent, or do they develop it accordingly?

Mr. MITCHELL. I think there is no question about it. I think when a man comes from a mine or a mill or a factory or a railroad, having exhausted his physical and mental energy, he is much more likely to seek recuperation or relaxation in unwise or unhealthful pleasures than he is if he comes from his work physically and mentally strong.

In other words, a man physically and mentally strong is more likely to get hold of a good book than a man who comes from his work exhausted. I do not think there is any question about it. I remember Prof. Irving Fisher mak-

ing a statement on the hours of labor, in which he said that as the result of scientific investigation the shorter working day makes a constant rise in the physical and mental standard of the workingman, and Prof. Clark, of Columbia, has even worked it out in detail. I remember reading where he said that if he wanted to get the most work out of a man for a day he would work him 24 hours; if he wanted to get the most work out of a man for a week, he would work him 18 hours; and if he wanted the most work out of him for a month, he would work him 12 hours, and so on; but coming down to the final statement he said that if he wanted to get the best work out of a man for his entire life he would work him 8 hours. So, purely on the standpoint of production it seems the 8-hour day would be best, and then he goes on to speak about the effect on his physical and mental condition.

Commissioner O'CONNELL. Shortening the hours has a tendency toward temperance rather than the other?

Mr. MITCHELL. There is no doubt about it at all.

Commissioner O'CONNELL. Are you familiar with the English disputes act?

Mr. MITCHELL. Generally.

Commissioner O'CONNELL. Would you think that if an act of that character should be introduced in this country it would be practicable?

Mr. MITCHELL. I think I shall have to ask you to describe the features you mean.

Commissioner O'CONNELL. The features of combination along the lines somewhat of the Newlands act, with the exception that both employers and employees would be represented on the commission to investigate and adjourn, without powers.

Mr. MITCHELL. As I said in response to the question of Mr. Thompson, my own judgment is that the establishment of such a tribunal would be of value in the maintenance of industrial peace and industrial righteousness.

The ACTING CHAIRMAN. Mrs. Harriman.

Commissioner HARRIMAN. I would like to ask if you are familiar with the English industrial council, but I see you met that.

Commissioner O'CONNELL. It is all tied up in the same proposition.

Commissioner HARRIMAN. As I understand it, the industrial council in England is made up of 13 representatives of employers and 13 representatives of employees, and I wondered which you thought would work the best in this country. The question is, Which would be better, the smaller ones—that, of course, has an independent term—the small one made up of six or seven?

Mr. MITCHELL. I think the small council that they have would be of greatest value. I think that is a pretty large body.

Commissioner O'CONNELL. That deals with the mining industry and transportation.

Mr. MITCHELL. With great big questions.

Commissioner HARRIMAN. As I understand it, it would be to deal with the large questions.

Mr. MITCHELL. I think perhaps a tribunal made up, say, of seven men, seven representatives, would be better, if they had authority to select or appoint, independent of themselves, tribunals in industries where disputes arose. That might be a better working body to have a council as small as seven.

Commissioner COMMONS. Mr. Mitchell, you have given several statistical statements. What authority do you depend upon for your statistical information, that you can refer this body to, to work out these statistical data to verify your statements?

Mr. MITCHELL. The statistics I have employed I have taken either from my own reports to the United Mine Workers of America, or those compiled by the United States Government.

Commissioner COMMONS. Those are collected from the employers, those you refer to as being compiled by the United States Government?

Mr. MITCHELL. Yes; I suppose so. The reports of the United States Geological Survey on coal production I referred to. I have not used very much of them; I am sorry I did not. But may I suggest that the commission will find the results of a most exhaustive inquiry and study made recently by a student and professor of Columbia University, Mr. Suffern? His book is devoted to arbitration and conciliation in the mining industry. The book won the first prize in an economic contest, and a copy of the manuscript is now in the hands of the Department of Labor here. Mr. Stewart, of the Department of Labor, has one copy of the manuscript of it. But I dare say that the book will be of very great value.

Commissioner COMMONS. For example, these accident statistics that you gave; what is the authority for them?

Mr. MITCHELL. The Geological Survey. I spoke from memory. I would not say positively.

Commissioner COMMONS. And the differential between picked and screened coal?

Mr. MITCHELL. From the agreements themselves.

Commissioner COMMONS. And the differential between rates made and paid miners by the tonnage?

Mr. MITCHELL. From the agreements.

Commissioner COMMONS. I mean to get at the earnings rather than at the rate.

Mr. MITCHELL. That is from my memory. That was based upon my judgment.

Commissioner COMMONS. Is there any way of us getting at that, except—

Mr. MITCHELL. It is practically impossible to find the average earnings of miners. You can get the average earnings of the day men in the mines, because you find their daily wage set down, but to get the average annual earnings of men who work by the ton is a practical impossibility. The coal companies in some instances could give that, but there is no place that they do report, where they report it. I have never been able to get them.

Commissioner COMMONS. You could not, then, determine what has been the actual increase over a period of 16 years?

Mr. MITCHELL. It would be a practical impossibility. You might by deduction. The report of the Geological Survey does show by States the number of days that the mine is operated. It shows the production of coal per man per working day. Now, by taking those figures and by figuring it as to what they received per ton for it, you might there get approximately the amount of wages earned in any one year and, of course, increases in their wages from year to year—the increase in the annual earnings from year to year—but that, of course, would only be approximate.

Commissioner COMMONS. The commission decided to adjourn at 1 o'clock and meet promptly at 2 o'clock. This afternoon we will try to conduct our witnesses into channels where they either differ with or supply omissions in Mr. Mitchell's testimony.

We thank you, Mr. Mitchell, for your appearance.

(At 1 o'clock p. m. the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 O'CLOCK P. M.

The ACTING CHAIRMAN. The commission will come to order. We will begin this afternoon with the testimony of Mr. Francis S. Peabody. You may proceed, Mr. Thompson.

TESTIMONY OF MR. FRANCIS S. PEABODY.

Mr. THOMPSON. Mr. Peabody, for the purposes of the record will you give the reporter your name, your residence, and business?

Mr. PEABODY. Francis S. Peabody. My residence is Hinsdale, Ill. My business is that of coal operator.

Mr. THOMPSON. In what field do you operate?

Mr. PEABODY. I have been operating in Illinois, Indiana, and Ohio. I have abandoned my Indiana and Ohio properties.

Mr. THOMPSON. I take it that your work is related solely to the bituminous fields?

Mr. PEABODY. Yes.

Mr. THOMPSON. I believe you heard more or less of the testimony of Mr. Mitchell this morning?

Mr. PEABODY. More or less of it. I did not hear it all.

Mr. THOMPSON. Mr. Peabody, in addition to what you probably heard, at the beginning Mr. Mitchell gave a history of trade agreements in the bituminous fields, their origination, dates, and in a general way what they contain and how they were arrived at. He gave somewhat of a synopsis of the conferences. I will assume, unless you want to make some statement in regard thereto, that he has correctly stated those matters, and I shall therefore ask you now what, in your opinion, is the advantage of trade agreements in the bituminous fields?

Mr. PEABODY. I wish I had heard Mr. Mitchell's testimony, because, having been brought up as an operator, I am not always entirely willing, even in the best faith, to admit that assumptions made by a man on the other side are entirely correct. Therefore, if I do admit Mr. Mitchell's statements it is because I have not entirely heard them.

My experience in the operation of mines and in the dealing with organized labor began in 1899. Prior to that time I operated nonorganized or nonunion mines. In 1899 the mines which I had at that time been operating were organized, and since that time I have been operating entirely with organized labor. The four-State agreement, to which Mr. Mitchell has undoubtedly referred and which is known as the Central-States agreement, is what we are all operating under at this time.

In my opinion trade agreements are wise. I think that the method of arriving at them is as satisfactory a method as can be arrived at. I, however, think that the present trade agreement, or the basis of the present trade agreement, is a false one. The present trade agreement is based upon an artificial condition, not upon natural conditions. In the endeavor to arrive at a peaceful and harmonious settlement of the differences between the miners and the operators it was determined to take into consideration not only the physical conditions of the mines that were being operated, but their geographical location, their freight rates, and the markets to which they were tributary. The question of the earning power of a man was not taken into consideration, except that in the finished veins of coal an effort was made to have the earning powers of a man sufficient to give a living wage.

In addition to that basis, however, the freight rates from that particular field and the quality of the coal in that particular field were taken into consideration in arriving at a cost in the general competitive market, and from that basis all the different wage scales—for example, in Illinois—were arrived at in some seven or eight different districts; so that the third vein of northern Illinois, which is located in Will County and La Salle County, where there was a freight rate of 50 cents a ton, as I remember it, at that time in the Chicago market and where the highest cost of production existed at that time on account of the thin vein and the poor condition of the mining, thus had a price that was arrived at in the Chicago market in this way: We will say that the cost of the thin vein lump coal at that time, under the minimum wage scale of mining, was \$1.50 and the freight rate was 50 cents. This would bring the cost of coal into the Chicago market to \$2 a ton. Then they tried to raise the wages of all the thick-vein operations south of there, so that those thick veins, which normally and under proper economic conditions would compete and put that third-vein field out of business, were raised so that they could not compete or could simply compete and hold their proportionate share of the market.

The consequent result of basing the trade agreement on artificial conditions has brought about—I will not say it has been the only thing to bring about this condition—practical insolvency of the operators in the bituminous field in Illinois, Indiana, and Ohio, so much so that in my own experience within the last six months I have abandoned working the mines that I own in Ohio on account of the fact that the 61-cent-mine run basis, or the dollar-lump-coal basis, which is at present existing in Ohio, together with the arbitrary charges made locally on account of narrow work, etc.—the items are so numerous it is not necessary for me to go into them—have made the cost of my coal so high in Ohio that I have been unable to continue to operate that mine. I am at present taking the rails from the mine; I am selling the mules and the motor haulage and oilers and dismantling the property.

This artificial trade agreement has resulted in that particular case to me in a loss of over \$400,000. I have nothing left of value in that property. I have the hills and I have the surface of the ground, and some time in the future conditions may become such that someone else may mine the balance of the coal that I am leaving in the hills.

That comes from an artificial basis for trade agreements. I do not want the commission to understand that I do not fully believe in trade agreements and that I do not fully believe in the employees uniting to negotiate with the employers, because I do; but I believe the basis that we started on some 16 years ago, being entirely based upon artificial competitive reasons and not upon the competitive reasons of the earning power of a man, is wrong. I believe the survival of the fittest—meaning the fittest from geological conditions, the quality of the coal, and the amount of money that a man can earn in working in the thicker veins—should make those mines having the geological, geographical, and

the economical advantages—meaning the quality of the coal—the mines that should be operated, while those that have not those advantages should be abandoned until economic conditions have either so increased the demand for the product of coal that then can be worked economically or that the thicker veins have been exhausted.

I wanted very much to have the opportunity of saying what I have said, because my relations with Mr. Mitchell, who is one of my very dear personal friends and with the miners, have been very warm and very close, and I am a strong and ardent believer in conciliation and agreements—while I think the entire basis of the trade agreements under which we are now working is wrong.

Mr. THOMPSON. Definitely, Mr. Peabody, will you state, so as to perhaps illustrate more clearly what you mean by that, in what respect the present agreement affected this mine of which you spoke. If there was no agreement between the union and the operators which was made on the basis of the competitive operators' standpoint, but solely from the standpoint of preserving to the union men a fair return, would that mine of yours be running to-day?

Mr. PEABODY. No; I think not. I think I made a mistake in making my investment at that particular point. I do not think that in the Ohio mine to which I referred the trade agreements have been the real means of driving me out of business at that point. I have had in Indiana a similar experience, and in mines along the road of which Mr. Delano is president I have had similar experiences, where the property has been compelled to be abandoned on account of roof conditions and mining conditions that simply prevented their being competitive mines, even to the adjacent mine. But in Illinois, to which I am referring particularly, Mr. Thompson, we have many veins of coal that we work; we have conditions as different as there are in the United States. We find the 36-inch vein of coal and we find the 9-foot vein of coal. We find coal with thick masses of dirt in the center, and we find thick veins of coal without a sign of dirt in them. My belief is that we should arrive at what a minimum wage should be, and base none of our scales upon any lower rate than what a man can comfortably live on and bring up his family.

I think I heard Mr. Mitchell's testimony in regard to the conditions and the personnel of the miners, and I think their conditions have improved enormously in the last 16 years, even if the financial condition of the operators has deteriorated during that period.

Mr. THOMPSON. Apropos, Mr. Peabody, of what you say with reference to the present competitive basis of the agreement, did you hear Mr. Mitchell's testimony that he considers that agreement should be so framed that all the coal would be mined, whereas to-day only about 60 per cent can be economically mined?

Mr. PEABODY. It is absolutely impossible, under present competitive conditions, to mine coal more economically than we do. That is one of the notes that I wanted to refer to as being one of the matters covered by Mr. Mitchell. The conservation of the resources of the earth can not be successfully carried on when the owner of the property is compelled to produce his product as cheaply as it can be produced. The proper manner, and, in the end, the economical method of producing coal is to drive your entries or tunnels and means of transportation underground to the extreme limit of the territory that you are mining, and from that point drive your lateral entries and turn your rooms and mine out all the coal, allowing the surface or, rather, the top above the coal to fall in as you retreat. In that method an entire recovery can be made. It will take, however, in the ordinary mining property, 8 or possibly 10 years, to drive those entries to reach the limits of the territory, 3 or 4 feet a day, or 3 or 4 feet a shift being the maximum distance that you can drive an entry during 8 hours. In the interim during that 10 years you will be producing only the highest-priced coal. It is hour work; you pay the highest rates of wages for it; and at no time have I ever driven a mine on that basis where I was able, during the period of development, to secure from the public the amount that it had cost me to produce that particular ton of coal. Therefore, it takes a long period of investment of capital and a long wait for the returns to mine coal along the proper methods of conservation.

Mr. THOMPSON. Mr. Peabody, what have been the benefits which have accrued to the operators from these trade agreements?

Mr. PEABODY. Perhaps the peaceful mines. I have been trying to study for a good many years the benefits. I think the only benefit we have is that we feel the condition of the man working for us is being bettered, and then there is

less danger of our being shot than there used to be in the old days. That is the only benefit I have seen so far.

Mr. THOMPSON. They give you more or less immunity from strikes, do they not?

Mr. PEABODY. They are assumed to. During the past year in Illinois there have been, I think, seven independent strikes in my properties, contrary to the agreements.

Mr. THOMPSON. Have they been of long duration or of great importance?

Mr. PEABODY. I think the longest was seven weeks at one mine, and cost us something like \$18,000 or \$20,000.

Mr. THOMPSON. What, in your opinion, would be the cause of those strikes and what would be the cure?

Mr. PEABODY. The cause of those strikes is largely the refusal of the men to obey the officers of their union, and also the unwillingness of the officers of their union to justly decide a question around election time—I mean miners' election time.

Mr. THOMPSON. Would any change in the present method of arbitrating and conciliating the disputes help in preventing and adjusting these questions?

Mr. PEABODY. There is no method of settling any question now. If a dispute arises between a miner and our pit boss, who is the local superintendent immediately in charge of that miner, and they do not agree, the matter is referred to the pit committee, which is the miner's representative, and to our pit boss. If they do not agree, the matter is referred, under our agreements, to the superintendent of the mine and the executive officer of the district organization of the miners. If they do not agree, it is referred to the executive committee of the operators and of the miners. If they do not agree there is no method by which the question can be settled, and as a rule it results in this: I have several notices showing the way in which they usually do ask us to agree, by serving a notice upon us that unless we yield within a given time, we must expect certain results. I think the last notice we had was that unless we yielded to their demands within five days, they not only would keep that particular mine on strike, but would call out all the rest of the mines that they had in that district; and I have no recourse.

Mr. THOMPSON. Have you any suggestions of changes in the machinery of adjusting disputes that would obviate these difficulties?

Mr. PEABODY. Yes; I am very keen to see a board of arbitration agreed upon by the joint associations of operators and miners. I believe if there were in our agreement a definite supreme court that could decide questions that we seem to be unable to decide very frequently, it would add greatly to our agreements on both sides.

Mr. THOMPSON. Have you considered any form of such a board of arbitrators?

Mr. PEABODY. I have studied, of course, the Canadian law and some of the laws that were referred to this morning. I have never gone into the question from a governmental standpoint. I believe that we could agree locally in our various States, or even in our interstate conventions, on some method that would help greatly without any State or governmental interference. Neither the operator nor the miner likes governmental interference. We feel, of course, very keenly that if the Government is given the power to interfere, they should also give us the right to protect ourselves by agreements in regard to prices. That, of course, goes without saying.

Mr. THOMPSON. Does any form of arbitration which you have in mind carry with it an umpire?

Mr. PEABODY. Yes.

Mr. THOMPSON. A deciding factor?

Mr. PEABODY. Yes; it would have to carry with it an umpire, and Mr. Mitchell and myself in one of our arguments some 15 years ago agreed to refer the question of differentiation in Illinois to arbitration. Fifteen years have passed, and we have as yet been unable to agree upon the third man.

Mr. THOMPSON. Of course, I assume that you have been perfectly—

Mr. PEABODY. Yes; I have been willing, of course, to take advantage of that. The first man he proposed was an ex-miner running a store down in Belleville, I remember very well.

Mr. THOMPSON. I should like to ask you what was the reason for the operators of the State of Illinois withdrawing from the State conference in 1906.

Mr. PEABODY. In 1910, I think it was, was it not?

Mr. THOMPSON. Yes.

Mr. PEABODY. Because there was absolutely no more sense in Illinois and Ohio and Pennsylvania having a joint conference than there is in Illinois and Nova Scotia and Alaska. The conditions are different. There are very few competitive conditions to be discussed, and the only question that I think is pertinent to discuss at any of these joint State conferences is simply the question of a uniform advance or decline in wages. In other words, if it is 10 per cent, of course it should be a 10 per cent increase all over the country, or a 10 per cent decrease. But outside of that, I have always been very strongly opposed, and was one of those, I think, who brought about the separation of the States at that time. After that they joined again. Now they have, I hope, had a final divorce in Chicago 10 days ago.

Mr. THOMPSON. Will you state what was the reason for going back to the old arrangement after 1910?

Mr. PEABODY. Because the miners would not negotiate in any other way, and some of the gentlemen said that we had to. It was not ourselves.

Mr. THOMPSON. What kind of an organization have the operators of the State of Illinois?

Mr. PEABODY. About as poor an organization as you can imagine.

Mr. THOMPSON. About how many members has it, and what percentage of the Illinois field does it cover, and what are its purposes?

Mr. PEABODY. There are three organizations in Illinois at the present time. There is the Illinois Coal Operators' Association, which originally, I suppose, covered all the railroad shipping mines in the State. At the present moment that organization has been broken up into the Illinois Coal Operators' Association, as it is called, the fifth and ninth districts of Illinois, which composes the mines in and around St. Louis, East St. Louis, and Belleville and north, and immediately in that section, and the third district group, which consists of the operators around Springfield, Ill. The third group broke away from the Illinois Operators' Association because the miners were clever enough to make a trade with them, saying, "If you gentlemen will sign up the agreement, we will let you work, and you can get the market away from the other fellows while you are working, and, of course, eventually we will gain in that we will force the Illinois operators to sign the agreement"; and their conclusion was correct. The fifth and ninth district operators took the bribe, made the money, and we lost out. So that they have been a very strong organization since, because they got some money into their organization at that time.

The third district group has been formed in the last four months by Springfield operators who were discontented with the operations of the Illinois Operators' Association.

Mr. THOMPSON. What proportion of the membership—I mean what proportion of the operators operating in the State of Illinois, if any, are included within those three associations?

Mr. PEABODY. I should think 80 per cent; possibly 90 per cent.

Mr. THOMPSON. Have these associations any other purposes than that of dealing with the union?

Mr. PEABODY. Dealing with the union, and doing the worst they can to each other; that is about all. We are utterly unorganized. We have been taking lessons for 16 years or so, being taught by practical teachers such as Mr. Mitchell and Mr. White, and you might think that the result would be that we would have an organization that would be worth something, but we have not, to-day.

Mr. THOMPSON. What have you to say with reference to the machine differential?

Mr. PEABODY. I have so much to say on that subject that I do not think you should, perhaps, get me started on it. I have volumes here that Mr. Mitchell and myself have said on the machine differential in Illinois that I can give to you to peruse at your convenience, especially on the arbitration question.

Mr. THOMPSON. Could you put it briefly and particularly with reference to its effect on the trades agreement?

Mr. PEABODY. I do not think I quite clearly understand your question. I do not think it has anything to do with the trade agreement.

Mr. THOMPSON. First, the differential comes as a result of the trade agreement, does it not? Originally it was made under it?

Mr. PEABODY. Yes; it was made under the trade agreements.

Mr. THOMPSON. And how did it affect the mine operator and how did it affect the earnings of the miner?

Mr. PEABODY. Well, I personally, of course, think that the differential on the machine is entirely inadequate for the capital invested in the machine and its maintenance and repairs. I really think that the machine enables the miner to earn more money than he would in the old method of pick mining. We all of us put them in, notwithstanding the fact that there is a very small percentage of gain to us, on account of the fact that it increases the tonnage very largely of our mines, and enables us to reduce proportionately our general overhead expenses, and also reduces the percentage of small coal or screenings in mining the coal.

Mr. THOMPSON. What is the method of reaching these differentials? What methods of agreement have you?

Mr. PEABODY. It was an arbitrary method that the miners arrived at. There was no basis in justice for it at all.

Mr. THOMPSON. Was it a matter of conference by both sides?

Mr. PEABODY. Oh, yes; there were repeated conferences, but conferences that were—I do not know exactly how to put it. The mine operators at that time were in desperate straits, and they took anything that the miners offered them; and that is another false basis on which our agreement was started.

Mr. THOMPSON. Generally, what has been the effect, if any, of the trade agreements on the efficiency of the miner, with reference to his individual work, and with reference to the methods with which he mines coal?

Mr. PEABODY. I think it has been disastrous with regard to the efficiency of his work and his methods. I think that the lack of our ability to discipline the men for bad mining, the almost impossibility of our having jurisdiction over them, is very bad. I agree with Mr. Mitchell thoroughly that the men should be paid upon the mine-run basis. I think that a man should be paid for all the work he does; but I also believe that the employer of labor should have jurisdiction over that labor while the labor is in his service, should be able to tell the man how put his shot, how to undercut his coal, how to properly prop his room, should have jurisdiction over him not only from the point of conservation of the coal mine, but of conservation of the coal in its being taken and mined, and also of conservation of the body of the man from safety reasons. Now we practically have no jurisdiction.

We are assumed to have the power to hire and discharge. We are assumed to have the inherent rights of the owner of property. We bargain, by individual bargain, many of those rights away, and when we do, of course, we have to give up that right. Many of those rights we have not given away. We have not given away the right to discharge or hire men, but notwithstanding the fact that we have not given it away, we can not either hire or discharge a man. We are limited to the number of men—what we call company men—that the union consents to our having.

For example, I have here a proposed agreement. I have just come from Peoria, where we have been working on this agreement that we have been trying to make with the miners in Illinois, where they try to limit the number of men in the employ of the company that we may have in the mines. In the largest mines in the State they classify the men, A, B, C, and so on, and they limit the number to three men. Now, I am operating a mine that I think is probably as large a mine as there is in the world. I spent eight years developing it before we began to turn our rooms, and the mine has a capacity of some 8,000 tons of coal in eight hours. Now, they tell us that we can only have three men in that mine to take jurisdiction over them for the company. It is an absolute physical impossibility for three men to get from room to room, from working space to working space, in the mine, to see whether the men are drilling their holes properly, whether they are properly timbering their roof, and so on. My own company put in a most exhaustive system for the prevention of accidents, and we have no help in it.

We are not allowed to have men in the company's service to call attention to the mistakes that the men make. They do not allow us to have jurisdiction.

Mr. THOMPSON. What is there in the contract that prevents the operator from having jurisdiction?

Mr. PEABODY. I think I saw a clause here last night. There are so many demands they are making this time it may be impossible for me to find it at the moment. [After examining document.] I do not think I will take your time looking for it, but there is a demand that we shall be allowed to have only three subbosses in the mine.

Mr. THOMPSON. That is not the present condition?

Mr. PEABODY. Yes; I think we have that condition now, at the present moment, that we are only allowed three men.

Mr. THOMPSON. Was that arrived at at the conference?

Mr. PEABODY. That was arrived at arbitrarily.

Mr. THOMPSON. The operators were at the conference and it was agreed to?

Mr. PEABODY. Yes; this has all been agreed to. Oh, yes; it is an unhappy condition, just the same.

Mr. THOMPSON. You think, then, that the operators should have somebody to take care of their interests and make their agreements?

Mr. PEABODY. It seems to me it is a reasonable request for us to make.

Mr. THOMPSON. Have you anything to say, Mr. Peabody, in reference to the statement of Mr. Mitchell that there was the employment of a great many unskilled miners by the operators, and that as a result of these unskilled miners being employed there were more accidents and that there was more destruction of coal in the mining of it?

Mr. PEABODY. I can only say that we employ only the men whom the Mine Workers' Union furnish to us. We can not employ anyone else. If they do not furnish us as good material as we want, we have no choice. We have to employ those men.

Mr. THOMPSON. From what Mr. Mitchell has stated and from what you now say, I should like to ask this further question: How do you employ additional miners? What is the method? Where do you send for them?

Mr. PEABODY. We are not allowed to send out of the State. Mr. Mitchell prevented that by having a law passed which is called the Mitchell bill. I held it up on him for a year, I am proud to say. That law prevents men from being imported from any other State to go into the mines. In fact, a man has to have two years' actual practical experience in Illinois coal mines before he is allowed to work in an Illinois coal mine; at least, that is my construction of the law and its effect.

Mr. THOMPSON. Of course, Mr. Peabody, the time is open for you to explain that, if you wish.

Mr. PEABODY. There is no explanation at all, except this, that the miners have local boards of examiners who examine a man as to his qualifications. These boards do not nominally consist of union miners—I mean that is not the requisite of the law—but they are appointed by the local county judge, whom the miners elect, and the result is that it is, of course, extremely difficult—I think they try to be just, and I assume it is hard to find a practical miner that has not a union card, but it makes it very difficult for us to obtain miners. We practically have to look to the union for the men.

Mr. THOMPSON. But do not men come in from other fields, like Indiana, and are they not permitted to work in Illinois?

Mr. PEABODY. Not without passing the qualifications. I think it would be an interesting matter for this commission to have that particular law and see just what it is.

Mr. THOMPSON. Have you a copy of it here?

Mr. PEABODY. I have not; no. Mr. Mitchell could probably quote it to you. It prevents competition, Mr. Thompson; it prevents us getting any other labor except the labor that the miners' union wants us to have. The quality of the labor has degenerated tremendously in the last 16 years.

Mr. THOMPSON. Does this objection that you state to hiring miners relate to union miners from other States?

Mr. PEABODY. I believe a man has to have a county certificate. Really Mr. Mitchell could help me answer that question, because I do not remember.

Mr. MITCHELL. I think it only relates to the men who have had no experience; it requires a man to have had two years' experience in a mine anywhere, and if he has had that experience he is entitled to a miner's certificate.

Mr. PEABODY. Do they not first have to go before the local county board and be examined?

Mr. MITCHELL. Not as to their efficiency. They take with them their certificate of efficiency that they have had two years' experience in mining.

Mr. PEABODY. Does that statement go without the examination?

Mr. MITCHELL. I think there is no efficiency examination. I think the only thing the law does is to prohibit the working in a mine of men who have never worked within a mine; it prevents them from working in the mines of Illinois. I think that is all the law does.

Mr. PEABODY. I think it would be a wise thing to have in your record that particular law. It is a very remarkable law and, I think, a very injurious law.

Mr. THOMPSON. I should like to ask you this question: Notwithstanding that fact, is there not a selection of workmen in Illinois by the operators?

Mr. PEABODY. We are allowed to refuse to give a man work without any real reason for refusing to give him work. There have been demands—there are demands in this new proposed agreement that we are considering here—that we shall give men work in the order of their applications, whether we want them or do not want them.

Mr. THOMPSON. But that has not been agreed to as yet? That is not a part of your present arrangement?

Mr. PEABODY. It is a demand they are making now, and it will probably become a part of the present arrangement. I do not know. It was not up to the time I left Peoria.

Mr. THOMPSON. Is there anything else you would like to say with reference to the operation of State agreements in regard to conciliation and arbitration in the bituminous coal-mining industry?

Mr. PEABODY. I came here with the hope and the feeling that the work that this commission was doing—was trying to do—would help wonderfully; I do not mean only in the operation of my own properties and coal mines, but it is a great power, and I think if the public can be brought to realize all the difficulties that the employers and employees have, and if this commission will investigate and see the troubles that there are, undoubtedly a recommendation by this commission, after studying the thing from all sides, would be of very great help to us all. I really and honestly think that I am anxious to see the conditions of the employees of this country bettered. Perhaps it is because I have reached that age of life where my mind begins to turn to less material things than making money, but in any event I think I am honest in that, and I believe that some solution can be arrived at. Of course, conciliation, I believe, is the only way.

Now, the method, whether the Canadian method, which involves publicity, and which I think has accomplished a great deal, is the best method; whether the Australian method is the best method; whether the method proposed by some of these new bills is the best method, I think it would take a commission studying those questions and looking at it from all standpoints, to determine. I do not think one person could answer that question.

Mr. THOMPSON. You have raised some serious objections to the trade agreement in the Illinois coal fields.

Mr. PEABODY. Not to the agreement, at all, but to the basis on which the agreement is made. I believe that the agreement should have been made, and not try to introduce artificial questions, questions that have nothing to do with labor. The quality of the coal that a man produces, the geological seam, has nothing to do with what he should be paid for it. The freight rate on which the coal is shipped from that particular district should have nothing to do with what you should pay the men for mining that coal. We have started on false assumptions.

Mr. THOMPSON. Was that on behalf of the operator, or at the instigation of the miner?

Mr. PEABODY. I think it was a combination of both. I am not blaming the miner or the operator for it. I was a nonunion miner at that time, going along happy in the old way, cheerfully, until they interfered with me.

Mr. THOMPSON. You believe, notwithstanding the objections which you have made, that the trade agreements which exist in Illinois coal fields are good things, are beneficial both to the operator and to the worker?

Mr. PEABODY. I do not believe that the present agreements are. I believe trade agreements are of great benefit. I think our present trade agreement, as it exists in Illinois, is—I know it is—a bad thing financially; and I think members of your commission who are almost as familiar with the situation as I am would verify the statement that 75 per cent—and that seems a tremendous per cent—of the coal operators in the State of Illinois are insolvent.

Commissioner WEINSTOCK. Seventy-five per cent?

Mr. PEABODY. Seventy-five per cent is my statement.

Mr. THOMPSON. What do you mean by "insolvent"?

Mr. PEABODY. I mean that they can not pay their bills.

Mr. WEINSTOCK. In the mining industry?

Mr. PEABODY. The miners also feel that way, because one of the latest things that they have demanded is that they will not sign an agreement, and it is one of the conditions of the troubles of the operator that they will not sign an agreement to work for an operator unless the operator first secures a surety

bond which he gives to the union, guaranteeing that the two weeks' wages which are always behind will be paid. Is not that an example of the faith that they have in our solvency? But that demand is really seriously in earnest. So many operators have failed in the last year or two and the men have lost so much money that it has been put in in all seriousness as a proper demand.

Mr. THOMPSON. Yes; but, Mr. Peabody, is this condition of insolvency a result of the trade agreements of the union?

Mr. PEABODY. No; not primarily of the trade agreement, but I think it is because of the basis on which the agreements were originally made. I do not know whether I make myself clear to you. I want to do so.

Mr. THOMPSON. If there were no union and if there were no trade agreement would that effect the solvency or insolvency of the operators in Illinois?

Mr. PEABODY. Why, yes. If there had been no trade agreements, the mine that was able to produce the cheapest coal and the best quality of coal and reach the market most economically would first be filled up with business. Then the next mine with the next most favorable conditions would get the business, and then the next mine, and then the next mine, and then the next mine; instead of trying to support 380 to 400 different mines all about, and trying to adjust all their prices, their freight rates, and labor rates, and quality of the coal, and putting their products all into one general market at the same price. It is an utterly artificial condition. It does not exist in any other trade that I know of.

Mr. THOMPSON. Are any of these mine operators that have possession of the best class of mines in danger of insolvency?

Mr. PEABODY. Oh, yes. For example, the O'Garrah Coal Co, which went into the hands of a receiver six months ago, I have now in mind. They were one of the largest operators in the country in one of the best veins of coal in the State, and what brought about their insolvency I do not know—whether it was incompetency, or agreements, or what.

Mr. THOMPSON. A lot of these mines that are now operating and are perhaps in a condition of insolvency, without the agreement would absolutely die out?

Mr. PEABODY. Why, no. Many of those mines are in a condition of insolvency now, and if they were without the agreement and allowed to produce and make their own agreements as to what they should pay the men and allowed to compete they would get very rich indeed.

Mr. THOMPSON. But many of them, perhaps the majority of the mines operated of these three or four hundred that you mention, would have to close down?

Mr. PEABODY. Surely. They should. They can not mine coal economically; they have not the quality of coal. Their costs are excessive. Their freight rates are excessive. Why should they reach the market?

Mr. THOMPSON. Mr. Chairman, that is all I wish to ask this witness.

Mr. BARNETT. Mr. Mitchell said, Mr. Peabody, that the number of working days was about 200 at the present time in the year—the average number of working days. Do you attribute that also to his method of reaching a differential so as to keep a large number of mines in operation?

Mr. PEABODY. I think that is one of the reasons.

Mr. BARNETT. Are there other reasons in addition to that?

Mr. PEABODY. Yes. The principal reason is the reason that Mr. Mitchell gave: The fact that the capacity of our mines is 30 per cent greater than the demand for our product.

Mr. BARNETT. The point I am trying to get at is the fact that the capacity is 30 per cent greater than the need, due to the different basis of the power of the mines to compete. Is that 30 per cent of capacity necessary to meet demands for coal, or is it artificial and produced largely artificially?

Mr. PEABODY. Yes; I think it is, because our business is largely a season business, a weather business. In the winter time it taxes very largely the capacity of the mines to take care of the peak load of the demand. In the summer time, of course, the minimum demand is so much smaller than the peak demand that possibly only one-third of the capacity is required; so that Illinois to-day, producing 60,000,000 tons a year, could very easily produce from 90,000,000 to 100,000,000 tons a year, while the peak of the load will demand a ratio of 90,000,000 tons in the three months of the wintertime, while the minimum demand will run down to forty or thirty-five million tons.

Mr. BARNETT. Is there a difference in the machine differentials in the different States?

Mr. PEABODY. Yes.

Mr. BARNETT. What is that difference? Is that also a part of this machine differential?

Mr. PEABODY. No; that is based purely on might and not right.

Mr. BARNETT. It does enter into the competing power, does it not?

Mr. PEABODY. It does. It makes a tremendous difference. For example, we were allowed 10 cents in Danville. There were no machines in Danville—no machines operating in Danville—so that they allowed 10 cents in Danville and only 7 cents in the rest of the State—where the machines were operated—so that, although Illinois nominally has a 10-cent differential, it actually has a 7-cent differential. The differential in Indiana is 10 to 12½ cents. In Ohio it is based upon the lump-coal price, and it runs up from 21 to 27 cents. I have not the exact figures, but there is a great variation in the differentials in each State.

Mr. BARNETT. You spoke of the fact that the miners were required to give their certificates in order to work in Illinois. Is there any other legislation in Illinois which bears upon the relations of the operators and the miners?

Mr. PEABODY. There is a great deal of very excellent legislation which has been enacted by our State, particularly along the lines of the safety of the property and the safety of the men. That has been another thing that has been very largely instrumental in bringing about the insolvency of the Illinois coal operators and for this reason, that these burdens, very just burdens, very proper laws, and very just rules in regard to fire appliances, fire construction, and the innumerable laws, all of which are excellent, have not been adopted by, for example, Indiana or by Ohio. These laws in Illinois have added to the cost of production in Illinois, I should say, very easily 6 or 7 cents a ton. They are proper laws. The trouble is that these laws should have been enacted only by all the four States, if they choose to keep up this artificial competitive condition jointly; but the operators, apparently, in some of the States have had better luck—I do not know that it is luck; I do not think that it is—either because, I think, these laws are probably—

Mr. BARNETT. Have you any run-of-mine legislation in Illinois?

Mr. PEABODY. That is a State law.

Mr. BARNETT. When was that passed?

Mr. PEABODY. It was passed in 1897 or in 1898. It was in 1897.

Mr. BARNETT. Everything was on the screen basis before that?

Mr. PEABODY. Yes.

Mr. BARNETT. And that led to the passage of the present law in Illinois?

Mr. PEABODY. Yes. I will give you an example in southern Illinois. Prior to my becoming a well-organized union operator, I was running a small coal operation—cheerfully and happily—in the southern end of the State. I was paying my men 25 cents a box for hand mining and for loading coal. The box contained anywhere from 2,000 to 2,500 or 2,600 pounds, and, I assume, as I remember my costs at that time, my mine-run coal cost me—this was in 1897—approximately 30 cents a ton on the railroad cars. That was in 1897—19 years ago. The least cost I have had in the last year has been a little in excess of 90 cents. Now, I was not paying the men a proper amount of money, and I was not paying them on a proper basis. They would load the box, but they would not get paid for all they should have been paid for—there is no question about that. But to-day they are being paid for all they should be paid for; but, through either inefficient mining, and I think many times—I will not say many times, but sometimes—with deliberate intent they put in such shots that they would break down the slate in the roof, break up the blackjack in the floor, break up the dirty bands in the coal, and, in putting the coal in the cars, they will throw it all in together as run-of-the-mine coal. If we had the jurisdiction of the men they would not do that. I do not think to-day there is a miner that is getting too much money. We are paying the men \$2.62, and I think they should have more money—many of them. But we should have jurisdiction, and we have none.

Mr. BARNETT. How far is the wage in the central field controlled by the competition of the unorganized districts—West Virginia and Pittsburgh?

Mr. PEABODY. It is not at all.

Mr. BARNETT. There is no competition between the coal there?

Mr. PEABODY. Oh, yes; they can put their coal into the markets very much cheaper than the organized fields, and in the last 10 years in Chicago the smokeless coals, the Pocahontas, and New River coals have increased their local consumption in Chicago from 50,000 to 2,000,000 tons in the 10 years and put out the union coals of Illinois and Indiana, and also it has displaced the anthracite on account of the quality of the coal and the price at which it can be.

Mr. BARNETT. It is, then, a chief factor in fixing the rate, is it not?

Mr. PEABODY. I have said that the basis is wrong.

Mr. BARNETT. I do not mean the differential, but I mean the basis—rate—the Hocking Valley rate?

Mr. PEABODY. Oh, originally; but it has nothing to do with it now.

Mr. BARNETT. This competition of the unorganized fields is increasing all the time, is it?

Mr. PEABODY. It is increasing all the time, but Illinois has increased its product 20 per cent in 10 years.

Mr. BARNETT. But is the competition of the unorganized fields increasing?

Mr. PEABODY. I think it is, relatively. I do not know that their production is increasing any more rapidly than it would have naturally increased if they were unionized.

Mr. BARNETT. If you have taken up at the biennial conference the question of whether the increase of 5 or 10 per cent should be made, is not this competition from the unorganized fields the chief factor?

Mr. PEABODY. That is the chief element of discussion.

Mr. BARNETT. That is what I wanted to get at. Is it the chief factor, or on what does the increased rate depend primarily, the possibility of getting an increase or decrease?

Mr. PEABODY. We have never had a decrease but once in our rate, and Mr. Mitchell gave it to us. He was very brave in doing it, because it was very much against what his men thought he should do. He did it because the general market conditions at that time were so bad and the financial condition of the country was so bad that he thought he was doing a proper and just thing. It had nothing to do with the nonunion mine.

Mr. BARNETT. Suppose the question were the increasing of the rate 5 cents a ton. Would the determining factor be whether or not the market in which they were then in control would consume less coal or would it be the possibility of loading those markets to the nonunion operator?

Mr. PEABODY. I think the first more than the last.

Commissioner DELANO. Mr. Peabody, as I understood you to say, the mining scale is based on an effort to equalize what you might call the advantages or disabilities of one field with another in respect to geographical location in relation to the market, the quality of the coal, and all that, and that the effect of that has been to increase the competition which the operators have had to bear rather than anything else?

Mr. PEABODY. Yes.

Commissioner DELANO. Is that a correct assumption?

Mr. PEABODY. Yes.

Commissioner DELANO. I understood you also to say that a trade agreement, in which you believe, was not possible or satisfactory unless you dealt with organized labor or unionized labor.

Mr. PEABODY. Yes.

Commissioner DELANO. Is that equally true with respect to the operators, that in order to make a trade agreement possible and workable the operators must or should be organized?

Mr. PEABODY. It is absolutely essential that the operators must be organized. We could only deal as units to be successful. Our weakness to-day is the fact we have three organizations in our State not in harmony.

Commissioner DELANO. That is what I want to get at.

Mr. PEABODY. Yes; that is true.

Commissioner DELANO. Whether part of the difficulty that Illinois and neighboring States have had has been due to the lack of organization and solidarity among the operators?

Mr. PEABODY. Yes; it is one of the great weaknesses.

Commissioner DELANO. How does the central bituminous region compare with the anthracite region in that respect?

Mr. PEABODY. The anthracite region, as I understand it, is controlled by a very few men who are a unit; who instead of sending, as we do, 150 or 200 delegates to a convention will send one man to represent the anthracite interests, or perhaps two or three men; and they are a unit as to what they will do and what they will not do. The miners in dealing with these two or three men know they have the power to say yes or no and treat them on an entirely different basis from the way they treat with a large mass of operators with diversified interests who are not cohesive, as is true with us in the central

district. The anthracite operators, I assume, can control their prices and conditions better than we can; I do not know.

Commissioner DELANO. Mr. Peabody, if you are looking toward trade agreements as a solution of the problem of finding industrial peace, would you say that it would require the public to contemplate the organization of employers quite as much as the organization of labor?

Mr. PEABODY. Yes; I very distinctly think so, Mr. Delano.

Commissioner DELANO. I want to ask one further question in respect to this biennial shutdown. The public have an impression, I think, that that is in part occasioned by coalition between the operator and the miner, and that, although the adjustment could be made before the time of shutting down comes, it never is made until after. Is that a fair statement?

Mr. PEABODY. I think Mr. White, the present president of the mine workers' union, has been very honest in his endeavor to satisfy the public in advance and to encourage his men in having no suspension. I think he believes, and I think Mr. Hayes and other of the executive officers of the present miners' organizations are sincere in their desire to have no suspension. We practically have none now, with the exception of Ohio and possibly in Pennsylvania. Ohio is up against a peculiar condition. Mining laws have been passed in Ohio during the past year which the operators have refused to recognize. I think the miners have the right on their side, in so far as they have the law on their side. I think this biennial suspension about which you are talking, and the inconvenience and the danger of it, come largely from the coal speculator more than from the genuine operator or the miner. The coal speculator or jobber—the dealer in coal—tries to make a harvest every two years by creating a scare in your mind, Mr. Delano, to get you to put 60 days' coal on the ground, and likewise the large utility corporations, simply to create an artificial price on account of the tremendous demand. If you will look over the past number of years that you have been dealing with the operators, you will find ordinarily that that coal was not used, but you carried it over and gradually used it up during the ensuing year, and that you had paid a speculative price for it. I do not believe the ordinary operator and ordinary miner have any desire to mislead the public or any desire to suspend work.

I think it would be a great benefit if we were allowed by law at the present time to suspend work for a month and shut down all mines for a month. I think it would make the market conditions very much better. I think it would be less destructive of results to the operator, and I think it would be resultant in steadier labor for the balance of this year to the miner. But we can not do that; the law will not allow us to restrict our output or to raise our prices or to go into any agreement that would result in bringing about better prices for our product.

Commissioner DELANO. Could you, as an operator, or could any other operator, guarantee to those who are large consumers of coal that there would not be this cessation? Could you on the 1st day of March state whether or not there was to be a cessation?

Mr. PEABODY. No; we could not. I had had faith in what the miners' officials said, and advised my customers this year I thought that there would be no cessation of work. I felt they were in earnest and that they realized how disastrous it was, not only to the industry from the operators' standpoint but from the miners' standpoint. I do believe, Mr. Delano, that the railroads of the country could largely help out this question of carrying such a great peak load as we have to carry, if the railroads, who are the largest consumers of cars, use them at the coal mines in getting a supply of coal on the ground during the summer months for 60 or 90 days' consumption during the winter months. Of course it would cost the railroads the interest on the capital invested in this storage coal, and it would cost the railroads the unloading and reloading charge, and also the depreciation on the quality which would necessarily depreciate during the six months' storage. But it would take away from the operator his peak demand in the winter; it would give the railroad the use of the cars in the winter, in which we now have to load the fuel coal in the wintertime for the railroad, and the railroad would have the use of that car for commercial purposes. It would greatly even up the load of the coal operator and, I believe, would greatly enhance the earnings of the railroads. I think I have personally discussed this question with you before, Mr. Delano. I think it would result in the operator not being required to carry such a tremendous investment to take care of a peak load, and that if the railroads would

put in a two or three months' storage every summer it would take a very large percentage off that peak and more evenly distribute the use of their cars and the use of our capital through the summer months of the year.

Commissioner BALLARD. Mr. Peabody, as an operator working with union miners, have you had any trouble from the union miners in your district in the way of refusing to use powder or tools or machinery that was nonunion?

Mr. PEABODY. They go through that process every year, but it is largely a matter of form with them.

Commissioner BALLARD. It is not any serious inconvenience?

Mr. PEABODY. No. We sell them nothing except powder, and I am rather under the impression that I made at one time the only union powder made, and I think every keg of it was objected to at the time by the pit committee, because I think they did not at that moment like me very much; but the union labor was there. I do not think it has any influence at all. The best selling tobaccos in mining camps are Five Brothers, and Miners' & Puddlers' Delight, both of which are nonunion tobaccos. It has no influence on them at all. They have the privilege of buying everything they choose. They can go out and buy their bits, caps, oils, picks, and everything else except their powder. The powder agreement covers six pages, showing the methods of testing the powders, etc.

Commissioner BALLARD. That is all I desire to ask, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Weinstock, do you care to ask any questions?

Commissioner WEINSTOCK. Mr. Peabody, you said that trade agreements do not prevent strikes or contract breaking?

Mr. PEABODY. No; they do not.

Commissioner WEINSTOCK. They do not prevent it?

Mr. PEABODY. No.

Commissioner WEINSTOCK. If so, what is the advantage of collective bargaining to mine owners?

Mr. PEABODY. I think it is very much better for the men and, in the end, is not injurious to the mine owners if the collective bargaining is done. Mr. Mitchell made some points, and I remember a point that he made was that in the early day, when contracts would be let, we have gone to our miners, before the union was in existence, and said, "We can get this Burlington contract or Wabash contract or this contract or the other contract, and we will keep you working steadily provided you will stand a reduction in your wages," and it was always met by some other man finally.

Commissioner WEINSTOCK. So it ended in squeezing labor?

Mr. PEABODY. Yes; it ended in squeezing labor, and if you squeeze labor too much you will squeeze capital.

Commissioner WEINSTOCK. I gather from what you said that the men are very much better organized than the owners.

Mr. PEABODY. Oh, yes; very much.

Commissioner WEINSTOCK. If the owners were as well organized as the men, what do you think would be the outcome?

Mr. PEABODY. I think it would result in agreements that would be very much more beneficial to both sides.

Commissioner WEINSTOCK. What is it that prevents the owners from organizing as well as the men are organized?

Mr. PEABODY. As a rule, financial necessities; a lack of confidence in competitive capital; the fear that one man will get the better of another; the lack of any law allowing us to even confer on better conditions; and the mistrust of capital for other capital.

Commissioner WEINSTOCK. In other words, the workers have more confidence in each other than the owners have?

Mr. PEABODY. Oh, very much more.

Commissioner WEINSTOCK. I inferred from what you said that the owners have in many things surrendered to the unions. Is this because of their superior organization and thus putting them in the saddle, so to speak?

Mr. PEABODY. There are many reasons why they have secured things. Some of the things they have secured were proper and they should have secured them. Many of the things they should not have secured. They secured those either by striking and tying us out or by getting some weak-kneed chap to give it to them and letting his mine start up, and he, beginning to get the market away from us, and rather than let him have the market, we would yield and give it to them, too. They are very clever. I can not tell you how clever they are. They work every possible way.

Commissioner WEINSTOCK. Then the conditions are just the opposite of what they were when the owners were in the saddle?

Mr. PEABODY. In the old days we used to make some money once in a while, but we do not now.

Commissioner WEINSTOCK. How do you reconcile that statement with the statement made by Mr. Mitchell this morning that he believed the condition of the mine owners is much better than before the introduction of collective bargaining?

Mr. PEABODY. I do not believe Mr. Mitchell has given you any evidence here that he is competent to testify from that standpoint.

Commissioner WEINSTOCK. You dispute that statement?

Mr. PEABODY. Oh, very distinctly; very distinctly.

Commissioner WEINSTOCK. If the mine owners are worse off than they were before the era of collective bargaining, do you think that is due to the organizing of labor?

Mr. PEABODY. Oh, no. I think it is due, particularly in the bituminous districts, to a rather unusual thing. One particular reason is that during the period of the anthracite strike bituminous coal was in very great demand. Men owning little properties, with perhaps \$30,000 or \$40,000 or \$50,000 invested, made during the four or five months the anthracite strike continued \$40,000, or \$50,000 or \$60,000. They made enormous sums of money. The price of the bituminous coal went away up. Screenings went from 25 or 50 cents to \$2 a ton at the mines, and lump coal went from \$1 or \$1.25 to \$5 or \$6 at the mines. I sold coal at Chicago to the railroads at \$5 or \$6 a ton on the cars that would ordinarily sell at \$2 or \$2.25. There was an enormous amount of money made by the bituminous operators. Just as happens in every boom, the thing is overdone; so that the money that was made at that time induced every operator—and every one who knew what money they had made—to sink new coal mines.

Commissioner WEINSTOCK. Stimulated production?

Mr. PEABODY. Overstimulated production. The only way they will ever be reduced to the demand is by the enforcement of these mining laws such as they have, for instance, in Illinois. To-day it costs 60 per cent more to sink a new coal mine than it did three years ago on account of the fireproof character of the shaft and on account of the new laws that are going into effect. That will naturally restrict new operations and the old ones will gradually die out. If governmental or State conservation laws could be passed, I think the supply and demand will automatically regulate it.

Commissioner WEINSTOCK. While, I take it, you dispute Mr. Mitchell's statement that the mine owners are better off to-day than they were before collective bargaining, you do not hold organized labor responsible for the declining earning power of the coal-mine owners?

Mr. PEABODY. I do not hold organized labor any more responsible for the present bad condition of the coal trade than I do the employer of that labor. Organized labor has demanded nothing very much that they did not think they were entitled to, and they have got it from us by hook and by crook—and I do not mean that in an improper way; I am using that as the old quotation.

Commissioner WEINSTOCK. That is, they have done what you and I and the rest of us would do under like circumstances.

Mr. PEABODY. Exactly.

Commissioner WEINSTOCK. If it is better, as you point out, for the owners in the various States to have uniform legislation on the matter of working conditions, why is it not wise for them to have collective conferences?

Mr. PEABODY. Because, unless it be Illinois and Indiana, I think there are very small competitive conditions. Ohio coal competes practically not at all with the Illinois coal.

Commissioner WEINSTOCK. Still, they have this one thing in common—the establishment of uniform working conditions.

Mr. PEABODY. I say, outside of the fact that I believe the day laborer should be paid as much in Ohio as he is in Indiana and Illinois, and if there is a general percentage raise or fall in conditions in one State I think they should automatically extend over the territory in which union labor works. But outside of that there is nothing to bring us together.

Commissioner WEINSTOCK. You were pointing out that the present basis of agreement, in your judgment, is wrong?

Mr. PEABODY. Yes.

Commissioner WEINSTOCK. What would you regard as a right basis?

Mr. PEABODY. The earning power of a man, the quality of the product, and the ability, from the geographical situation, of that party to reach a market.

Commissioner WEINSTOCK. If you had full power in the matter, and, with your great knowledge and experience with conditions, were asked to prepare an agreement that would be fair to both sides, what would be the vital points you would establish that are different from the present arrangements?

Mr. PEABODY. Such an agreement as I would draw would put most of my competitors out of business automatically and properly. That is a correct statement, because I have made my investments in the thick veins of the State where properly coal should be mined first, because it can be mined more economically and living wages can be paid in its mining and where the quality of the coal is superior and where it is centrally located to markets north, east, south, and west, and it is where the demand should go first and should be supplied first.

Commissioner WEINSTOCK. I suppose you would have a hard time convincing your competitors that that was a wise thing to do?

Mr. PEABODY. Many of my competitors probably would not agree with me at all on that proposition, but they could not logically contend against it, because when you consider that you start on an artificial basis, you have to artificially hold that basis up. Anything that is artificial is finally bound to go in the end. It is going to come in our industry. That is what is causing insolvency of these properties gradually.

Commissioner WEINSTOCK. Has the introduction of machinery in mining reduced the percentage of skilled workers and increased the percentage of unskilled workers?

Mr. PEABODY. Oh, very materially.

Commissioner WEINSTOCK. It has done that?

Mr. PEABODY. Oh, yes. It does not take skill now.

Commissioner WEINSTOCK. From that statement, I would take it that skilled labor is not much of a factor in your industry?

Mr. PEABODY. It has become largely a manufacturing proposition, a raw-material loading proposition now. There are expert men driving our machines. Our timber men ought to be experts. Our track layers and our mine examiners are experts. But it does not take an expert to take a shovel and shovel coal from the floor of a room into a car. That is the largest cost at the present time.

Commissioner WEINSTOCK. How does the earning capacity of the unskilled laborer of to-day compare with the earning capacity of the skilled laborer of 1897?

Mr. PEABODY. The unskilled laborer in the thick veins earns much more. I have not brought any records with me, but we frequently find a man earning \$6 or \$8 a day, an unskilled laborer, in our thick veins, while in the thin veins that same laborer could not earn to exceed \$1.75 or \$2 a day right at the present moment. I contend that that man should not work in that thin vein, but he should come and work in the thick vein until the thick vein is exhausted.

Commissioner WEINSTOCK. Can you recall approximately what the skilled worker in 1897 earned?

Mr. PEABODY. In 1897 a good miner at 25 cents a box, working 10 hours, would earn \$2.25 to \$2.75 a day. That was the nonunion man.

Commissioner WEINSTOCK. As a matter of fact, the unskilled worker to-day is earning as much as the skilled worker in 1897?

Mr. PEABODY. In eight hours; yes.

Commissioner WEINSTOCK. So that while there is less demand for so-called skilled labor, the unskilled worker is better off to-day than the skilled worker was at that time?

Mr. PEABODY. Yes. We used to pay our unskilled laborer a dollar a day, and now they can earn up to \$6 or \$8 a day.

Commissioner WEINSTOCK. At that rate the machine has not been such a calamity after all to society?

Mr. PEABODY. Oh, no.

Commissioner WEINSTOCK. It has lightened the burden of the worker?

Mr. PEABODY. Yes; it has lightened the burden of the worker.

Commissioner WEINSTOCK. And still made it possible for him to increase his earning power?

Mr. PEABODY. It has. I do not think the miner objects to the machine. He objects to saying how much of the earnings of the machine shall go to him and how much to the man that owns the machine.

Commissioner WEINSTOCK. He want a share of the saving?

Mr. PEABODY. He does not want a share.

Commissioner WEINSTOCK. He wants it all?

Mr. PEABODY. Yes.

Commissioner O'CONNELL. What is the annual earning, approximately, of a miner at this time?

Mr. PEABODY. That is an extremely difficult question to answer.

Commissioner O'CONNELL. How many days in the year does he work? Mr. Mitchell said 200.

Mr. PEABODY. From 155 to 210 or 215, has been the average in Illinois of late years.

Commissioner O'CONNELL. Greater than it was formerly?

Mr. PEABODY. Oh, no; not in the number of days of work. Up to the time of the anthracite strike, I think the percentage of days was less, but I can not speak from the book.

Commissioner O'CONNELL. At the time of the anthracite coal strike did you have yearly contracts with the railroads to furnish coal?

Mr. PEABODY. If I had, I carried them out.

Commissioner O'CONNELL. Did you keep the contracts?

Mr. PEABODY. If I had, I carried them out. With some of the railroads I did not have contracts, however.

Commissioner O'CONNELL. And to those the price was raised?

Mr. PEABODY. To the limit that I could take from them—and with pleasure, too.

Commissioner O'CONNELL. In the nonunion days you speak of, before you came to an agreement, what was the standard of the miner's living as compared to the present time?

Mr. PEABODY. The standard of the work is very much better, and the standard of his living very much better. There has been a wonderful improvement, and I am very thankful of it, too.

Commissioner WEINSTOCK. How do the private habits of the mine workers to-day compare with the private habits of the mine workers of 1897?

Mr. PEABODY. From my knowledge of them—and I am with them a great deal; I have been building mining towns, etc.—the average is very much higher, I think. There is a very much higher class of men, although, as Mr. Mitchell said, the English-speaking and Anglo-Saxon element is diminishing very rapidly, and we are taking our miners from southern Italy and northern Italy, the Hungarians, and the Slavs, etc., a very large percentage of them. We are losing our old English and Welsh miners very largely.

Commissioner WEINSTOCK. There is a higher degree of sobriety now than there was?

Mr. PEABODY. I think so.

Commissioner WEINSTOCK. And also a higher grade of morality?

Mr. PEABODY. I think so. I think the whole standard of the miner has improved greatly. I have been very much interested with my friend Mitchell in going to miners' houses to see his picture hanging there rather enshrined. He is rather typical of a higher being. I am not joking in this. I am very serious. I am very fond of Mitchell, and I think his work and the work that has been done has elevated the whole standard of their lives. Mitchell is there more as an ideal than as a person. He has done wonders for the men socially and in every other kind of way. They are no longer beasts, as many of those miners were, but they are becoming intelligent, argumentative, distinct human beings.

Commissioner WEINSTOCK. Has not that been brought about also largely through the increased leisure that affords them opportunities for cultivating their minds?

Mr. PEABODY. I think that is very largely so.

Commissioner WEINSTOCK. The development of their work in the unions?

Mr. PEABODY. Yes. These debating societies and the unions are debating societies. Mr. Mitchell spoke of fewer accidents in union mines. You must bear in mind that a man has less chance of being hurt or having an accident in 8 hours than he does in 10. The majority of accidents come from the falling of slate or the falling of coal from the face. Our great trouble in preventing these accidents is lack of authority. We mark a place unsafe and a man will pay no attention to it. If he does not get hurt and we have not found that he did not get a timber up there, nothing is done. If he gets killed, we can not discharge him. The consequence is, in the last season, although we have spent more money in my own corporation in the prevention of accidents, we are having more accidents than we ever have had before.

Commissioner WEINSTOCK. How is that explained?

Mr. PEABODY. The only way I can explain it is there may be some luck or there may be some series of accidents coming together, as they sometimes do, that you can not account for. But I explain it in the lack of jurisdiction over the men to prevent them getting in the way of accidents. In other words, if we mark a room unsafe and say they must not go into it, and if they do go into it, we should have the right to discharge them, and there should be sufficient men watching them when they go in such places that their discharge would be brought about; and if they are seen going into those places they should be discharged, which would have a tendency to prevent it. But they will not allow us to do that. They will not allow us to put protection around them that should be put there for their lives. We say, we hope it is for humanity first, and, second, the financial burden put upon us by the accidents.

Commissioner WEINSTOCK. Illinois is working under a compensation law?

Mr. PEABODY. Yes; and our company is under that act, and we carry our own insurance.

Commissioner WEINSTOCK. It is a voluntary system?

Mr. PEABODY. Yes; it is voluntary.

Commissioner WEINSTOCK. Does that tend to minimize the causes of industrial friction?

Mr. PEABODY. I think not at all.

Commissioner WEINSTOCK. You think not?

Mr. PEABODY. No. I think it is a very just act, but I do not think it does away with any causes of friction.

Commissioner WEINSTOCK. In the event of an accident, can you settle it now more speedily and with less friction and less heat than under the old employer's act?

Mr. PEABODY. There have not been any strikes on questions of that kind. Today the operator pays and the individual gets the compensation, and it is not taken by the lawyers. It is a very just, good method.

Commissioner WEINSTOCK. Under the old conditions, where the miners only got a fraction of what they were justly entitled to, the greater part of it going into the hands of the lawyers, it would frequently create bitterness and ill will?

Mr. PEABODY. It must necessarily have done so.

Commissioner WEINSTOCK. That is obviated now?

Mr. PEABODY. I think so, largely.

Commissioner O'CONNELL. You spoke of the miners having their strikes regardless of the contract being in existence?

Mr. PEABODY. Yes.

Commissioner O'CONNELL. Have the operators any weaknesses of that kind?

Mr. PEABODY. Undoubtedly, they have locked men out when they ought not to have done so, but they do not do it often.

Commissioner O'CONNELL. Then it has not been entirely one sided?

Mr. PEABODY. No; it has not been entirely one sided; there have been many instances where operators have improperly acted, but the majority of the cases are from the miners' standpoint. The operator does not dare to do it, the operator would have no jurisdiction over him if he does it. They have the jurisdiction, and if we are acting improperly in calling our mine out, they do it at once.

Commissioner O'CONNELL. Then you do not care to go back to the old conditions; you prefer to rest on the present contractual relations?

Mr. PEABODY. I prefer to rest on the present contractual relations, if they are based on sound economic theory to start with.

Commissioner O'CONNELL. If you own a mine within 20 miles of Chicago, and I own a mine 1,000 miles from Chicago, you think I ought not to have as reasonable conditions as you do?

Mr. PEABODY. I do not know why your miners' wages should be cut down to enable you to produce coal so cheaply that you can overcome by the cost of your production the difference in freight rate between the 50-mile haul and the 1,000-mile haul.

Commissioner O'CONNELL. You think that there should not be something human in there to protect me?

Mr. PEABODY. Not the slightest. You must go and find your market.

Commissioner O'CONNELL. And if I do not find it?

Mr. PEABODY. Then you should not exist.

Commissioner O'CONNELL. I suppose that is a very serious question between you; I do not see why it should not be.

Mr. PEABODY. The miners can move. There are not too many miners; they could move. We see continually all over the world abandoned cities and abandoned towns and abandoned neighborhoods. Political economy has taught us that that comes from the survival of the fittest. I mean by that the men that can produce cheapest and best must take the market first, and you can not artificially maintain any other condition and maintain it successfully.

Commissioner O'CONNELL. You think under the interstate rule of the long haul and short haul your position is correct?

Mr. PEABODY. Absolutely. The railroad should be paid for every mile that it hauls goods, and should be paid more the greater distance. I do not suppose we want to become involved in the terminal question, but that has largely to do with it.

Commissioner O'CONNELL. I do not care what I become involved in.

Mr. PEABODY. I know, but I am looking at my friend Delano, and I know he is a past master on that question.

Commissioner O'CONNELL. What about the cutting out of the middle man in the coal business, and delivering the coal direct from your mine to my house?

Mr. PEABODY. I think that is a question hardly involved in this.

Commissioner O'CONNELL. No; I think it is involved in this.

Mr. PEABODY. You can not do away with the distributor. We could not ship a carload of coal to your house. I would want to put it through some man's yard that could break up that carload and distribute part to your house and distribute part to some other man's house.

Commissioner O'CONNELL. But you can ship a carload over to my house.

Mr. PEABODY. If you could take a carload of coal; that is, if you were able to handle it when it came here.

Commissioner O'CONNELL. If I purchased the coal of you, would you deliver to me direct at the same rate you would furnish it to some one else, the same article under the same conditions?

Mr. PEABODY. There would be a good many conditions I would want to discuss with you before I answered that question.

Commissioner DELANO. One question: What effect has the existence of this agreement had on the retail selling price of coal, Chicago?

Mr. PEABODY. I do not quite understand that.

Commissioner DELANO. What effect has it had? How has the existence of this agreement between the operators and the union affected the general selling price of coal in the city of Chicago, at retail?

Mr. PEABODY. Well, our selling price has increased, but not as much as our costs have advanced, and they have increased, and necessarily the retail price has increased.

Commissioner DELANO. I judge from what you said about the improvement of the miners, do you ascribe any of that to the existence of the organization and the existence of the agreement that the organization has brought about? Have their moral standards improved, and their living standards improved?

Mr. PEABODY. I think it has had a great deal to do with the improvement, their officers, and talks and teachings of their officers, the fact that they were getting better wages; everything has added to that.

Commissioner DELANO. Did you hear the questions that were asked Mr. Mitchell this morning regarding the matter of technical education through vocational education of miners or miners' children?

Mr. PEABODY. Yes.

Commissioner DELANO. Do you think that education could be so reorganized as to be of benefit to the children of miners if they were going to be miners themselves later on?

Mr. PEABODY. No; I can not see where we could get the miners' children into technical schools and benefit them at their trade, but I think they could go into technical schools and into the public schools, as they are going, and benefit them greatly for their future life, but not for the particular trade of mining. I do not see where you could teach them anything; the question of gas and the question of all these things, such as the stratification of coal and the rock and the slate above the coal—I do not believe you could teach them those things; they have got to find that out from actual practical experience.

Commissioner DELANO. If we all conclude the same as evidently the two miners have concluded, then, there is no field for their training in the world, because if there is not a field there, there is not anywhere. I have been digging at this thing for some years.

Mr. PEABODY. Technical training in mining is the question you asked me?

Commissioner DELANO. Yes.

Mr. PEABODY. I think there is a field for technical training of the men who are superintendents and mine engineers, but I do not think for the miner himself, unless it be a general mechanical training that would benefit anybody.

The ACTING CHAIRMAN. Mrs. Harriman.

Commissioner HARRIMAN. No questions.

The ACTING CHAIRMAN. Mr. Peabody, I think both you and Mr. Mitchell seem to agree that for the good of both sides the employees and operators should be allowed to organize an association that might have some control over prices.

Mr. PEABODY. I think we both agree on that; yes.

The ACTING CHAIRMAN. And you feel that that would be quite important, say, in the Illinois field, to enable the operators to recover and to continue paying these wage scales that you agree on?

Mr. PEABODY. I think of more importance would be the changing of the base.

The ACTING CHAIRMAN. If you should change the base you would not need a combination of employers to fix prices, would you?

Mr. PEABODY. Yes.

The ACTING CHAIRMAN. Would not your southern mines be able to drive the others out of business?

Mr. PEABODY. Yes; but there are many southern mines.

The ACTING CHAIRMAN. Why should you need to go into combination, if the more superior mines are to be allowed to drive the inferior ones out?

Mr. PEABODY. Because there are so many of the superior mines.

The ACTING CHAIRMAN. And you would still permit them to combine?

Mr. PEABODY. I certainly should.

The ACTING CHAIRMAN. What would be the gain for either the miner or the public or the conservation of coal?

Mr. PEABODY. The stability of the industry.

The ACTING CHAIRMAN. How would that figure out on the conservation end?

Mr. PEABODY. It would not figure out on the conservation end, because the operator would still continue to mine as cheaply as he could. The conservation end would have to be figured out in combination with conservation laws, possibly, which the operator would have to obey. I believe such laws—governmental or State laws—should be passed as, for example, that not to exceed 10 per cent of the coal in the ground should be left in the ground.

The ACTING CHAIRMAN. By legislation?

Mr. PEABODY. By legislation; and if those laws were passed, then it would be entirely essential that the operator would have some method of securing a price for his coal that would compensate him?

The ACTING CHAIRMAN. I understand that your interpretation of the way the miners get at this is that they would want to protect the mine workers in the thin districts; their wages have been raised slightly, and in your district they have been raised three or four times?

Mr. PEABODY. Yes.

The ACTING CHAIRMAN. Would not the Government or the State try to regulate that by trying to protect these people?

Mr. PEABODY. I think they should not. I think they should say to these people, "Go to where the economy of production and quality of coal will be given to the public first." If they protect those people they have to allow the thick-vein man to get more money out of his coal. The basis should be the earning power of the man—of the laborer.

The ACTING CHAIRMAN. Your idea seems to be that a new equilibrium would be reached, that certain proportions of the thin veins would be abandoned and the labor would move to the thick vein?

Mr. PEABODY. Yes.

The ACTING CHAIRMAN. The thick-vein people would make more money; and the Government should regulate the price to a point where it would wipe out a certain proportion of the thin veins and maintain a certain proportion of the thick veins?

Mr. PEABODY. Yes; and I believe the market should go to a point, logically, where it can buy the best quality at the lowest price, and that the price should be sufficiently high to allow sufficient remuneration to labor to allow it to live comfortably.

The ACTING CHAIRMAN. You probably thought of an interstate trade commission?

Mr. PEABODY. I think very well of that.

The ACTING CHAIRMAN. And do you think that such a commission for the mining industry should have jurisdiction over wages—over a trade agreement?

Mr. PEABODY. I think you would have great difficulty in securing that jurisdiction. It would be a very admirable thing if some good father, whether it be the United States or the State, should take paternal jurisdiction of us in all these features, including guaranteeing us a profit.

The ACTING CHAIRMAN. You favor the guaranteeing of a profit, evidently?

Mr. PEABODY. Yes; and I think the others ought to go with it.

The ACTING CHAIRMAN. And also in being protected against the union? You want to be protected against the union?

Mr. PEABODY. No; they should protect one citizen against another citizen.

The ACTING CHAIRMAN. I understood you to take the ground that it was not right to determine these questions between you and a labor organization; that they simply have might?

Mr. PEABODY. I have stated that; and if they have the might, they have secured what they have got; if we should organize to double the same might, although we would not, we have not got it.

The ACTING CHAIRMAN. But if the State or the Government should help you in fixing a price combination you would not need the other?

Mr. PEABODY. We would not need the other.

The ACTING CHAIRMAN. I want to ask about the changing character of the miners. Before the union came in, were there many of these foreign-speaking miners, like the Italian and the Polish, and people of that kind?

Mr. PEABODY. Not as many. The English, Scotch, and Welsh predominated.

The ACTING CHAIRMAN. Can you explain why it is, then, that the miners' union, controlled by the English and Scotch, should import Italians and Polish people to take the place of English-speaking miners, and furnishing only Italians and Polish, as against the English speaking?

Mr. PEABODY. I think the ordinary English and Scotch and Welsh miners, seeing the manner in which they mine coal now, naturally refused to work in such a condition.

The ACTING CHAIRMAN. But apparently their wages have at least doubled?

Mr. PEABODY. That is true, but it does not require the skill of the old miner. The old miner was a craftsman, and a wonderful craftsman. He knew the geological conditions, the mining conditions, as none of us ever will know them. He sensed them in some way.

The ACTING CHAIRMAN. He placed it more on the basis of pride in his work?

Mr. PEABODY. Oh, he had pride in his work. It is not an admirable craft; it is laborer's work. These craftsmen have gone into other work.

The ACTING CHAIRMAN. Have you had occasion to observe—I suppose you never have had occasion to observe the Italian and Polish people in the unorganized places, as to how they compare in discipline, and so on, where they are not organized.

Mr. PEABODY. Yes; I have been in unorganized, nonunion villages, where the standard seems to be lower than the same class of men that I find in our own districts—union districts.

The ACTING CHAIRMAN. Standardized to what?

Mr. PEABODY. The apparent cleanliness of living.

The ACTING CHAIRMAN. I spoke of the union's observance of discipline and the conducting of these occasional strikes—unorganized strikes. Have you had occasion to observe that?

Mr. PEABODY. No.

The ACTING CHAIRMAN. Then you would not know how the strikes of the unorganized Polish and Italians would compare with the present organized strikes?

Mr. PEABODY. No; I would not know how they compare with the organized strikes; I haven't had that experience.

The ACTING CHAIRMAN. Didn't you have, in your system in Illinois, Mr. Williams as an umpire? Where did his work come in?

Mr. PEABODY. Mr. Williams, of Streator? I think he arbitrated some questions.

The ACTING CHAIRMAN. I understood he was a standing arbitrator or umpire for disputes.

Mr. PEABODY. I do not know about that.

Commissioner DELANO. I think he had something to do with settling the Cherry mine disaster.

The ACTING CHAIRMAN. You have never had that?

Mr. PEABODY. No. I would like to suggest to your commission that I brought with me a number of instances, which I do not want to leave, but I will leave them with the Chair, which embraces all the agreements made in Illinois since 1897, together with volumes of debates between the miners on one side and the operators on the other, as to the reasons pro and con why these demands should not be granted. I think it would give you a great light, better than any witness could give you, of the manner in which our present trade agreement was brought about, and I should be only too glad to furnish such data for the commission if they desire it.

The ACTING CHAIRMAN. We would be very glad if you would.

Commissioner DELANO. I think it would be very valuable.

The ACTING CHAIRMAN. Our secretary will make a memorandum of that.

Mr. PEABODY. You will find all through the debates here that we were not debating the earning power of the men; the earning power of a man has nothing to do with it. You will find that all through these debates. It is simply competitive conditions.

The ACTING CHAIRMAN. The object there is to furnish every man a job?

Mr. PEABODY. Well, they could furnish them the jobs—

The ACTING CHAIRMAN. To give every man a job in the place where he is living?

Mr. PEABODY. That is the point; in the place where he lives.

The ACTING CHAIRMAN. That is evidently the object of the union, is it not? Would you not say that?

Mr. PEABODY. Yes; that is the object of the union.

Commissioner O'CONNELL. Do any of the miners own their own homes—that is, in the little towns?

Mr. PEABODY. Not many; but we are gradually beginning to build up.

Commissioner O'CONNELL. And if they had to leave, what would become of the homes?

Mr. PEABODY. The home would be abandoned; it would become valueless. But you will find to-day all over the States mining villages that have been abandoned. In a village in Ohio—we had a village there of about a hundred houses, and they are gone. Oh, of course, they are there.

Commissioner O'CONNELL. And that is so of your company?

Mr. PEABODY. Yes; in that case, but men would not build there. It would be as bad in my case.

Commissioner O'CONNELL. But the miners, if they have homes, they attempt to protect them by obtaining the work?

Mr. PEABODY. Yes; naturally.

Commissioner WEINSTOCK. What is the use of the owners entering into agreements with the workers? I mean, what is the good of making a contract if they will not keep it?

Mr. PEABODY. Well, a contract that is kept 80 per cent is better than no contract at all.

Commissioner WEINSTOCK. And there are about 20 per cent of slippages?

Mr. PEABODY. I do not think I could say that fairly. There were 187 cases in Illinois.

Commissioner WEINSTOCK. Strikes?

Mr. PEABODY. No; not strikes, but where they could not reach an agreement. I think they called 87 strikes on my company.

Commissioner WEINSTOCK. In violation of your contracts?

Mr. PEABODY. In violation of our contracts. So much so that in one case the executive officers of the miners' union notified the men that they must go to work, and they refused to go to work, and they finally had to revoke their charter. That mine was out nine weeks in that case, and in that case the executive officers of the miners did the best they could to live up to their contract with me, but they could not force the men to do it, and that has been repeatedly the case. Still in another case, I have a letter from Duncan McDonald, secretary of the United Mine Workers of Illinois, notifying me that unless I granted the demand which they were making, which is not in accordance with the contract, he would give notice that all the mines that I controlled in that district should be called out on a strike.

Commissioner WEINSTOCK. Despite your contract?

Mr. PEABODY. Yes. He was bluffing; he did not do it.

Commissioner WEINSTOCK. Is this tendency toward contract breaking increasing or diminishing, say, as compared with what it was 5 or 8 or 10 years ago?

Mr. PEABODY. I think it is increasing, and I think that is largely on account of miners' politics.

The ACTING CHAIRMAN. Mr. Thompson, have you any other questions?

Mr. THOMPSON. Yes; I have one more question; that comes back to this question of vocational training. Is there any provision to educate the young boys, say, from 14 to 18 years, who are working around the mine? And in that connection, this further question: If there is not, would it not be a good thing to have these young boys, these sons of foreigners, educated so that they can speak the English language, so that they can understand the institutions of this country, some general knowledge of mining, so as to make them not only better workers in the mines, but better citizens of the country.

Mr. PEABODY. I think that is being done.

Mr. THOMPSON. What has been done in that regard?

Mr. PEABODY. I think that the schools are developing all through these mining sections; I think that the additional money that the miners are earning is enabling them, instead of trying to get the boys to work in the mines—of course they are not allowed to work in the mines until they are 16, I think, in our State—I think the educational advantages they are all getting are really helping the next generation tremendously now.

The ACTING CHAIRMAN. Mr. Peabody, we are very thankful to you.

TESTIMONY OF MR. FRANK J. HAYES.

Mr. THOMPSON. Will you give your residence and occupation? I think you have already given your full name.

Mr. HAYES. Indianapolis, Ind., at this time; international vice president of the United Mine Workers of America.

Mr. THOMPSON. You have heard Mr. Peabody's testimony, have you not?

Mr. HAYES. Yes; parts of it.

Mr. THOMPSON. In reference to the effect of union rule enforced through the agreement on the economic operation of mining?

Mr. HAYES. Yes.

Mr. THOMPSON. That is to say, of definitely established periods so as to bring those working in the Illinois field, 75 per cent of the operators, on the very of bankruptcy?

Mr. HAYES. Yes.

Mr. THOMPSON. What have you to say in that regard?

Mr. HAYES. Well, I will say this, that there are too many mines and too many miners, as Mr. Peabody said, due to the anthracite strike. There was a great demand for coal, and a great many men went into the coal business, and the trouble the operators have over there is due to that excess of competition among themselves, and not to the miners' union.

I want to say further that the coal production of Illinois has increased more than 100 per cent in the past 10 years under this so-called union domination.

Mr. THOMPSON. Then in your opinion the contract agreement made between the union and the operators in Illinois has not been the cause of this insolvent condition?

Mr. HAYES. No, sir.

Mr. THOMPSON. If the operators in Illinois should wish to change that rule, do you think the union would oppose it?

Mr. HAYES. What particular rule do you refer to?

Mr. THOMPSON. The differential. Take these mines that have large veins and can be worked more economically than the thin-vein mine; if those operators should ask the union for a rate based on the earning power of the men, and that it should have nothing to do with the rates paid elsewhere, would the union agree to it?

Mr. HAYES. I think the rates now are based largely on the earning power of the men; we would not agree to a lower rate in these thin coal fields, because if we did the miners would be very poverty stricken, and they are pretty bad off the way it is.

Mr. THOMPSON. Mr. Peabody said that in no case, so far as they discussed it with the miners' union, is the earning power of the miner taken into consideration, but rather, the establishment of differentials, so that the owners of the various mines can operate those mines instead of having some of them close down.

Mr. HAYES. In making our wage scales we tried to give each operator a competitive rate. Now, we have different rates in different seams in Illinois.

In the coal fields like West Virginia we have a much lower rate than we have in Ohio or Indiana or Illinois. In making our rates we try to make them so that the coal operators can all compete upon an equitable basis, or as nearly so as possible. Of course, we have not attained any degree of perfection as yet on that, but it is the basis of our wage agreements.

Mr. THOMPSON. Mr. Peabody contends that as a result of that there is an artificial standard forced into the coal industry, and that as a result of that artificial standard 15 per cent of the operators in Illinois are in a condition of bankruptcy. Now, would the union be willing, say, to establish a State rate of wages—a uniform standard State rate—which would permit the operation, perhaps, of favorably located and easily worked veins and that would close down thin veins and veins which are distant from the demand centers?

Mr. HAYES. No; we could not make a rate that would destroy property or put any coal operator out of business, or that would put the men out of business in the mining town in which they lived.

Mr. THOMPSON. But Mr. Peabody says if a standard rate should be made—he did not name a standard rate, but that is the only way to take it—the miners who were working in these regions where the conditions are unfavorable and there are getting little pay would be able to come to the thickly veined and favorably located mines and there earn better wages and also have work to do.

Mr. HAYES. That is a mistaken impression, because these mines now are employing all the men that they can employ, so that it is absolutely impossible that the men on the thin veins could come down to the thick veins and find employment, because the thick veins have at present all the men they can employ; so that that is not practical; it is not possible; it is a theory and not a condition.

Mr. THOMPSON. Do you mean that none of the thick-vein mines which are now open in the thick-vein country could employ more men than they do to-day?

Mr. HAYES. I do not think they could.

Mr. THOMPSON. Did you hear what Mr. Peabody said with reference to the tunneling to the end of the coal field in any particular mine, and running their laterals from that tunnel, and if that method were pursued, which is not pursued to-day, would that then give place for more workers in the mines?

Mr. HAYES. I did not hear the statement that he made.

Mr. THOMPSON. He stated this, that to economically work a coal mine the main tunnel should be run to the end of the field in which the coal lay.

Mr. HAYES. To the boundary line?

Mr. THOMPSON. To the boundary line of the mine proper; and that then they could operate in the far end first, and let the ceiling fall and come right back, and it would eliminate certain mining operations, and he did not state what, but I presume timbering, and so on, and also that it would develop a larger field, in which more men could work.

Mr. HAYES. Well, that system is in vogue in some States, and I think it is done in some places in Illinois. It conserves the field supply and makes mining more economical where it is practiced. Of course, that is with the operator. The union has nothing to do with that. We could not tell him how he is to mine his coal. If the operator thought that would be the best system, there is, of course, nothing to prevent them from adopting that at the present time. The union does not prevent them from adopting any system of mining that they want to adopt, as long as it does not reduce the earning power of the miner.

Mr. THOMPSON. Yes; but if you say that the objection to the making of a State standard rate of wage would be that the thick-vein mines are now using all the help that they can, this other method would perhaps permit you to use more men, and then you could abandon this method which you now have of differentials which permits a thin vein to be worked and the miner to receive a low rate of wages.

Mr. HAYES. I do not think it would require any more men for that particular work that he mentions. It might require a few more, but not many.

Mr. THOMPSON. What have you to say with reference to Mr. Peabody's statement that notwithstanding the trade agreements, strikes are called, and that they are very numerous in the Illinois fields? What answer have you to give to that statement?

Mr. HAYES. The operators violate their contracts a great deal, forcing the employees, oftentimes, to strike. That contract is just as obligatory upon the

coal operator as it is upon the coal miner, and the blame, I should say, from my experience, and I am an Illinois miner and have worked in the mines in Illinois, is generally as much on the operator as it is on the coal miner. That is, the operator agrees in the contract to do certain things. He does not do them. He violates the contract. The miner, after exhausting all the provisions laid down by the joint agreement and not getting redress, goes on strike, and the responsibility is largely on the operator.

Mr. THOMPSON. I understand from Mr. Peabody's statement, and I think it was so intended, that these strikes were not called after the provisions of the agreement for mediation and conciliation were exhausted, in which case the strike, of course, would be in violation of the agreement, but before the machinery for settling the disputes had been put in operation.

Mr. HAYES. I want to say that in the Illinois contract we have a provision fining the miners for a violation of contract. We fine them \$5, and we collect the fines. We have collected thousands of dollars worth of fines from coal miners. We enforce the system, and unless the miner carries out the contract we fine him, or expel him in some cases, if he is particularly obnoxious.

Mr. THOMPSON. Mr. HAYES, what is the extent of the union organization in the coal-mining field? Take, for instance, the bituminous fields?

Mr. HAYES. Well, we have about 300,000 bituminous coal miners, and about 100,000 anthracite coal miners organized.

Mr. THOMPSON. In the bituminous fields, what States, generally, does that cover?

Mr. HAYES. We have a 100 per cent organization, you might say, in Illinois, Indiana and Ohio, Michigan, Iowa, Missouri, Kansas, Arkansas, Oklahoma, Wyoming, Montana, and Washington. In those States every miner is a member of our organization. But in other States, like Pennsylvania and West Virginia, Tennessee and Alabama, and Kentucky and Colorado they are only partly organized.

Mr. THOMPSON. In your opinion how many unorganized miners are there?

Mr. HAYES. About 350,000, I should say.

Mr. THOMPSON. Where are they principally located?

Mr. HAYES. In Pennsylvania, the central portion; in the Irwin fields and the Connellsville fields, in Pennsylvania; in Maryland, West Virginia, Virginia, Kentucky, Tennessee, Alabama, and Colorado, and New Mexico, and Utah.

Mr. THOMPSON. What is the difference, if you know, in the wages and hours of work and general working conditions of the organized miners working under trade agreements and the unorganized miners?

Mr. HAYES. The organized miners' condition is much superior. The wages are much higher, the hours of labor are shorter, mining conditions are better, life is safer, environments are better, moral standards are higher, and educational standards also.

Mr. THOMPSON. Take some specific field of nonunion mining, say West Virginia. Do you know what the difference there is between those people there, with respect to these conditions, definitely?

Mr. HAYES. Approximately.

Mr. THOMPSON. What is approximately the difference in wages and hours?

Mr. HAYES. I have not any West Virginia contract with me. Let me see; I should say that the union prices are about 100 per cent higher than the prices that obtain in West Virginia. The hours of labor are all the way from one to two less than they are in West Virginia—in the organized territory.

Mr. THOMPSON. What has been the difficulty in organizing the Connellsville coke district and the western Pennsylvania district, if you know?

Mr. HAYES. The difficulty has been due to the murderous system employed by the operators in that field. That is, they employ a large army of gunmen, better known as guards, who make life very unsafe for any union organizer that goes into that field. Not only that, but they dominate the political life of those counties, and it is impossible for us to successfully organize the men, in view of that opposition. The men themselves want to join, want to belong, want to be members of the miners' organization, but they are afraid of those influences, and will not stand up. They are not free; they are not free men; they are not free Americans; they are slaves.

Mr. THOMPSON. Did you hear what Mr. Peabody had to say with reference to the organization of some form of arbitration body, an arbitration board, of which there should be an umpire?

Mr. HAYES. I did not hear that. I arrived rather late.

Mr. THOMPSON. Mr. Peabody said that he thought that the establishment of a board of arbitration with an umpire would be a great aid in settling the questions and disputes which arise in the mining fields of Illinois. That does not exist to-day. What have you to say with regard to that?

Mr. HAYES. It all depends upon who the umpire is.

Mr. THOMPSON. Well, generally?

Mr. HAYES. Our organization is committed to arbitration and conciliation—mediation—so that, of course, our view would be determined by the arbitration outlined, or the system of arbitration that would be used. We do not fear, and never have feared, to present our case to any body of fair-minded men, or to any fair-minded man. We have arbitrated a great many of our difficulties. President Mitchell arbitrated the anthracite strike, and we have offered arbitration in other strikes, but it was refused by the operators. We have offered arbitration in the Colorado strike, in which I have been engaged for the last five months, and it has been refused there; so that there is more responsibility resting upon the coal operators in their disputes with the coal miners than there is upon the miners.

Mr. THOMPSON. What would you say as to a board of arbitration in the Illinois field, as Mr. Peabody suggested; a permanent board, which would take up questions arising under the contract and decide them?

Mr. HAYES. As I said a while ago, it would all depend on the system of the arbitration.

Mr. THOMPSON. Take a system where you have an umpire and an equal number representing each side, and then the third man or the fifth man, whichever it might be, from outside to decide the issue in case the two sides could not get together.

Mr. HAYES. Personally, I would have no objection to a system of that kind.

Mr. THOMPSON. Would such a system be favored, do you think, by the body of the miners in the State of Illinois?

Mr. HAYES. That would depend largely on the arbitration board selected and the system employed in taking up the cases and disposing of the cases.

Mr. THOMPSON. Of course, assuming that the board had an odd man on it, and assuming that the board would be more like a committee on immediate action, it would deal with cases almost as soon as they would arise, and deal with them without delay.

Mr. HAYES. That would obviate one more objection to arbitration; that is, it would give prompt action. If we could have a quick method of disposing of disputes, it would be preferable to the old custom, in which there was so much delay. However, in the southwestern district, composed of Missouri, Kansas, and Oklahoma, the miners and operators generally agree upon a permanent arbitrator and jointly pay this arbitrator; and there strikes are eliminated, in those three States. This arbitrator is supreme.

Mr. THOMPSON. You say strikes are eliminated?

Mr. HAYES. In those three southwestern district States; they are supposed to be eliminated. Of course, once in a while the processes of the contracts are not gone through with, sometimes by the miners and sometimes by the operators, and strikes have occurred even under that system, but I would say that they are almost entirely eliminated.

Mr. THOMPSON. It has been an advantage, has it not?

Mr. HAYES. Yes.

Mr. THOMPSON. Why has not that system been introduced in the State of Illinois?

Mr. HAYES. I could not say. I do not know that the operators are so anxious for arbitration as they appear to be. There are many things over there that I think, if they were arbitrated, they might not secure all that they think they are entitled to.

Mr. THOMPSON. In your opinion, from your knowledge of the effects of that principle working in the Southwest, you would be in favor of it, I take it?

Mr. HAYES. Yes; I am in favor of the principle.

Mr. THOMPSON. And you think that the miners of Illinois would be in favor of it, too, changing from the present system?

Mr. HAYES. Yes; they have attempted it on numerous occasions rather than strike, so that it is nothing new, except the working out of a fair system.

Mr. THOMPSON. You know of no reason why it has not been established permanently there, as it has in the Southwest, do you?

Mr. HAYES. No; neither side has taken it very seriously. That is the reason why, I suppose. It has not been made an issue.

Mr. THOMPSON. That is all that I wish to ask, Mr. Chairman.

Commissioner WEINSTOCK. Has socialism and the I. W. W. established very much of a hold in the miners' union?

Mr. HAYES. Well, socialism is quite strong among the miners.

Commissioner WEINSTOCK. Has it the dominating influence in the union?

Mr. HAYES. I do not think it has. I think that the Socialists, Democrats, Republicans, and Progressives all view the industrial problem—that is, so far as taking up their disputes and fighting for better wages and better conditions is concerned—about the same; that is, they do not bring their politics into the trade-union matters and the general conferences with the operators.

Commissioner WEINSTOCK. I was under the impression that the Socialists primarily joined the unions to get control of them and to have their doctrines prevail in unionism.

Mr. HAYES. No.

Commissioner WEINSTOCK. Now, is that information correct?

Mr. HAYES. No; I think that impression is wrong.

Commissioner WEINSTOCK. Is it or is it not the fact, from what you may know of socialism, that socialism is not in favor of arbitration?

Mr. HAYES. Socialism is a future state of society—a state of society, it is supposed to be. Of course, the philosophy of the Socialists is that they are entitled to the full social value of their toil.

Commissioner WEINSTOCK. Yes.

Mr. HAYES. That they can not arbitrate anything that would mean less than their securing that full value of their toil. The Socialists, quite a number of them, are broad minded enough to understand this competitive system well enough to know that we are not in socialism now, and we have to meet a condition, and the Socialists in the miners' union are trying to meet that condition as best they can. They are not a disturbing factor and do not interfere with the working out of trade agreements.

Commissioner WEINSTOCK. How about the I. W. W.? Are there many of those in your miners' organization?

Mr. HAYES. No; the I. W. W. is rather an unknown quantity among the coal miners. In fact, we do not let them propagate their doctrines; at least, we try to prevent their ideas from becoming accepted by our people.

Commissioner WEINSTOCK. The I. W. W., as I gather, are absolutely opposed to arbitration, are they not?

Mr. HAYES. Yes; they are opposed to arbitration. There is nothing constructive about their philosophy; it is all destructive.

Commissioner WEINSTOCK. You were saying a little while ago, Mr. Hayes, that the miners' union disciplined its members and penalized those who violated the contract under which the union might be operating.

Mr. HAYES. Yes.

Commissioner WEINSTOCK. It penalizes them by a money fine of \$5, I gather?

Mr. HAYES. Yes; \$5, I think they fine a man now.

Commissioner WEINSTOCK. What means has the union of enforcing payment?

Mr. HAYES. Well, we collect it like we collect the dues.

Commissioner WEINSTOCK. It is charged up to their account?

Mr. HAYES. Yes.

Commissioner WEINSTOCK. But if they do not pay it?

Mr. HAYES. If they do not pay it we refuse to work with them.

Commissioner WEINSTOCK. And they practically ostracize themselves, automatically?

Mr. HAYES. We refuse to work with them unless they pay all fines and dues and assessments.

Commissioner WEINSTOCK. Let me see if I understand your procedure. When an employer, from the viewpoint of the union, does not comply with the provisions of the agreement what is the first thing that is done on the part of the union in that matter?

Mr. HAYES. Say a dispute arises around the mine. I will trace the case up. The pit committee and the mine bosses gather to adjust it. If they fail to adjust it it is then taken up by the district officials and the superintendent or owner of the company. Then, if they fail to adjust it is generally referred to a joint executive board meeting of the two associations, the coal operators' union and the coal miners' union, and in the joint executive session the dispute is thrashed out, and oftentimes in these joint conferences, when the dispute has gone that far, they decide to leave the case to some outsider to decide it by arbitration; or, if the miners think their case is one which can not be left to

arbitration—that is, that a fundamental is involved—under the contract they have a right to serve notice of independent action upon the operators, which means a strike. That is the system; that is the policy in settling our disputes.

Commissioner WEINSTOCK. I gathered from the testimony that was submitted here from others—I have gotten the notion, right or wrong, that despite the existence of a contract the unions would quit at the drop of the hat, without going through all this process.

Mr. HAYES. No; there are very few cases I ever heard of like that, and I was secretary and treasurer of the Illinois State miners for a period of years.

Commissioner WEINSTOCK. In other words, then, the strike is the last resort?

Mr. HAYES. Yes.

Commissioner WEINSTOCK. Not the first resort?

Mr. HAYES. It is always the last resort.

Commissioner WEINSTOCK. It is only resorted to when all other means have been exhausted?

Mr. HAYES. When all other means fail—all peaceful means.

Commissioner WEINSTOCK. That is all, Mr. Chairman.

Commissioner BALLARD. I was going to ask you about this arrangement of fixing the wages in different lines in Illinois. Does that same condition obtain in the southwestern mines, in Oklahoma and Kansas and that territory; and do they do the same there, or are the wages of the miners uniform?

Mr. HAYES. It depends largely on the coal seam, the distance from the market, and the earning power of the mine.

Commissioner BALLARD. It is the same as in Illinois, then?

Mr. HAYES. Yes; it is practically the same; in some places higher, due to the thinness of the veins. There are some veins down in Kansas where the miners are paid \$1.05 and \$1.15 a ton, but they can not dig more than about 2 tons a day. The operator can not pay a higher rate there.

Commissioner BALLARD. That is a different basis from that in Illinois, because where the vein is thick the miner would make \$5 or \$6 a day, and where the vein is thin he would make only \$2?

Mr. HAYES. Yes; and yet the operator pays more to him for a ton of coal and yet the miner does not make as much wages.

Commissioner BALLARD. That condition in Illinois, then, is the same as in other places?

Mr. HAYES. Yes. There never was, and never will be, uniformity in the coal-mining industry. There can not be. The veins are irregular, conditions are not the same in any mine. There is always some difference. So that uniformity that the operators talk about is a physical impossibility.

Commissioner BALLARD. You speak of sometimes there being some injustice to the labor union, and sometimes there would be a strike where there should not have been. Does either side ever attempt to arrive at the amount of injustice and make it up to the other side in money value?

Mr. HAYES. Yes.

Commissioner BALLARD. For instance, if you fine that man, do you pay that fine to the operators?

Mr. HAYES. Half to the operators' union and half to the miners' union. I understand that when these strikes occur the association helps the company against which we are striking. I might say further that I would like to mention one case here to show the value of trade agreements and the discipline we have. Out in Oklahoma a few years ago a coal company violated the trade agreement and shut down the mine for a month or two—I can not recall the exact time. Anyway, they were fined an amount approximating \$11,000. I think they were fined \$100 for every day they were idle. They paid into the association that \$11,000 fine. They were fined under the joint agreement. Both sides were fined. We try to make the operators live up to their contracts as well as the miners, and regardless of what they say they are as bad in the matter of violating contracts as the coal miners.

Commissioner BALLARD. Is there any limitation in the matter of apprentices in the organization?

Mr. HAYES. No.

Commissioner BALLARD. Each miner does as much as he can in eight hours?

Mr. HAYES. Yes; and the apprentice gets as much as the miner; that is, the man that is learning the trade or work in the place with the miner. Of course, the apprentice does all the heavy work. The skilled miner sees that he does the hard work while he does the directing. That is what he pays for his apprenticeship; but he shares in the earnings equally with the skilled miner.

Commissioner O'CONNELL. He is simply an assistant laborer?

Mr. HAYES. Yes.

Commissioner O'CONNELL. There are no recognized apprentices under the contract?

Mr. HAYES. No. Of course, I think there is an assistant laborer in it, but the miner is a skilled man, and this other man is merely learning the trade.

Commissioner O'CONNELL. In this question which Mr. Peabody was raising about closing down the nonpaying mines, he suggests it is one of the methods that the mine owners have for protecting the property, but it is an absolute destruction for the miner, and there should be some other and different method for arriving at a conclusion of that matter, should there not?

Mr. HAYES. Yes; of course.

Commissioner O'CONNELL. Is not that one of the reasons that is taken into consideration in the way of purchase of the property of the individual members of the organization in permitting them to go from one mine to another?

Mr. HAYES. I am surprised Mr. Peabody would advance that sort of philosophy here. I do not understand it at all. In the first place, it is impossible.

Commissioner O'CONNELL. The total loss of earnings and savings to the miners would be destroyed by carrying out that principle?

Mr. HAYES. Their homes and the towns would be destroyed. The operators operating in these little seams want to live just as well as the operators in the large seams. This competitive game is a very brutal game at best. I have my own opinion about it. As long as it exists, you will find these inequalities.

Commissioner O'CONNELL. That is all.

Commissioner LENNON. Do you find, Brother Hayes, there is any considerable degree of industrial unrest among the miners?

Mr. HAYES. Yes; considerable.

Commissioner LENNON. To what cause do you think it can be properly ascribed?

Mr. HAYES. Universal desire for better life; more of the things that labor creates.

Commissioner LENNON. You think the unrest is born of the natural desire of the men for better opportunities in life and better conditions in life?

Mr. HAYES. Yes.

Commissioner LENNON. There is nothing special as regards the miners, differing from the clothing worker or workers in other trades, is there?

Mr. HAYES. I would say this, that the miner of to-day is reading more than the miner of yesterday. The young English-speaking miner of to-day is better educated than the miner of 20 or 30 years ago. It is largely due to this union. Due to our union, we will not allow boys to go into the mines until they have attained the age of 16 years. I had to go into coal mines when I was 13 years old, in Illinois, largely due to the fact that we had no organization and no laws to protect us. When the union became strong we succeeded in improving the lot of the miner in many ways, and especially in protecting the boy and keeping him out of the mines.

Commissioner LENNON. Mr. Hayes, what spirit seems to be growing most strongly among the miners as to the cure for this unrest? Is it a spirit of desire to destroy things or is it a spirit of intent to build up? Is the anarchistic spirit—as that word is generally used, and not in its philosophic sense—increasing as to this unrest?

Mr. HAYES. No.

Commissioner LENNON. He has much ambition for better things, has he?

Mr. HAYES. I would say it is ambition for better things. It is the ideal; it is a new vision that the labor movement has brought to the miner of to-day that he did not have to such a large degree 20 or 30 years ago. It is due to the change in our conditions. It is due to the evolution of the race.

Commissioner LENNON. I do not believe I care to ask anything further.

The ACTING CHAIRMAN. Mr. Hayes, can you give us now, or possibly later, the cases of what you mentioned of payments being made to the employer from the guaranty fund? Can you give us instances where that occurred?

Mr. HAYES. Yes; lots of them. Of course, I could not give you the names.

The ACTING CHAIRMAN. You can furnish that information from your office?

Mr. HAYES. Yes; I can furnish it from my office.

The ACTING CHAIRMAN. Are you acquainted with the anthracite field? Have you been detailed to work in there?

Mr. HAYES. No.

The ACTING CHAIRMAN. You are not familiar with that?

Mr. HAYES. No; Mr. Mitchell has been in there very much more than I have, and very much more, I think, than any other member of our commission.

The ACTING CHAIRMAN. Mrs. Harriman wants to ask a question.

Commissioner HARRIMAN. I want to ask if the different nationalities work together?

Mr. HAYES. Fairly well.

Commissioner HARRIMAN. Is there much segregation of nationalities as there is in the New England cotton industries, for instance, at Lawrence?

Mr. HAYES. No. They mingle together quite freely.

Commissioner HARRIMAN. They do?

Mr. HAYES. Yes. I have been in Colorado all year, and I would just mention one instance about nationalities getting together. In one of our tent cities out there we have 25 nationalities. There is a big strike there that has been on for a number of months. There are 25 nationalities there, and we have not had one single disturbance of the peace in a strike that was begun last September. They get along very nicely and very friendly. Of course, that might be due to the fact that there is a strike on where they forget their racial prejudices. But, on the whole, I think they get along very nicely; they amalgamate well.

The ACTING CHAIRMAN. That seems to be all, Mr. Hayes; thank you very much.

TESTIMONY OF MR. O. P. BRIGGS.

Mr. THOMPSON. Mr. Briggs, will you give us your full name and address and your connection with the National Founders' Association?

Mr. BRIGGS. My name is O. P. Briggs. I live at Minneapolis. For two years I was commissioner of the National Founders' Association, one year vice president, and seven years president. My term of office expired November last.

Mr. THOMPSON. I understand in 1899 the National Founders' Association made an agreement, called the New York agreement, with the union.

Mr. BRIGGS. They did.

Mr. THOMPSON. Tell us what was the history of that agreement and when it was terminated and why.

Mr. BRIGGS. That agreement was the outcome of about a year and a half or two years' effort on behalf of the foundrymen of this country, numbering about 500 shops, in an effort to purchase molders' labor in a collective capacity. A small number of men got together first. I think it was about a year and a half after they had exchanged ideas in regard to this labor problem informally that they received an invitation from the iron molders' union for a joint conference, which they granted very readily indeed. Every member of this founders' association at that time was imbued with the idea that they should meet these workmen, either individually or collectively, as the workmen saw fit themselves to elect, and make a good, strong, vigorous, honest effort to meet them on the ground of collective bargaining, which really was what that union at that time desired very much, as they presented it to the employers from time to time. This year and a half was just prior to 1899, as you have stated, Mr. Thompson; and in February, I think, of that year this New York agreement, to which you referred, was consummated.

Perhaps, as a matter of record here, if you would like it, I had better submit a copy of that agreement. If you desire that I go into this agreement to some extent, I think perhaps I had better read it. There are several salient points in it. It reads as follows:

"NEW YORK AGREEMENT, IN FORCE AND RULING BETWEEN THE IRON MOLDERS' UNION OF NORTH AMERICA AND THE NATIONAL FOUNDERS' ASSOCIATION, CONFERENCE 1899.

"Whereas the past experience of the members of the National Founders' Association and the Iron Molders' Union of North America justifies them in the opinion that any arrangement entered into that will conduce to the greater harmony of their relations as employers and employees will be to their mutual advantage: Therefore be it

"Resolved, That this committee of conference indorse the principle of arbitration in the settlement of trade disputes and recommend the same for adoption by the members of the National Founders' Association and the Iron Molders' Union of North America on the following lines:

"That in the event of a dispute arising between members of the respective organizations a reasonable effort shall be made by the parties directly at interest to effect a satisfactory adjustment of the difficulty, failing to do which either party shall have the right to ask its reference to a committee of arbitration, which shall consist of the presidents of the National Founders' Association and the Iron Molders' Union of North America, or their representatives, and two other representatives from each association appointed by the respective presidents.

"The finding of this committee of arbitration by a majority vote shall be considered final in so far as the future action of the respective organizations is concerned.

"Pending adjudication by the committee on arbitration there shall be no cessation of work at the instance of either party to the dispute.

"The committee of arbitration shall meet within two weeks after reference of the dispute to them."

In discussing this agreement I will call your attention to two very salient points.

Commissioner WEINSTOCK. What was the date of that agreement?

Mr. BRIGGS. February, 1899. The agreement was enforced, if you would like this record now, until about November 15, 1904, when it was abrogated, and at the time the convention of foundrymen abrogated it they gave the molders' union 30 days' notice that they did not care to be bound by its provisions further, and it was abrogated, and they so notified us.

The two points to which I wish to direct your attention in regard to that agreement now—and I sincerely hope you will keep them before you if you feel this is worth following—are, first, that while the word "arbitration" is used in this agreement, in the strict sense of that word it is a misnomer. It is not an arbitration. It is a means of conciliation.

Point No. 2. It is provided in this agreement that not over two weeks shall elapse before the representatives of the molders and the representatives of the proprietors shall get together. I think the members of the iron molders' union and the members of the founders' association brought forth when that agreement was made that it was not perfect, but that in all probability it might possibly serve its purpose in bringing representatives of the two associations together in an effort at conciliation. We all hoped it would be a step in that direction, out of which we might possibly evolve something that would bring about a definite and distinct and complete understanding as to what should prevail in the relations between the members of the founders' association and their employees, the molders. A vigorous effort was made to proceed under that agreement. From the time the association was organized until its abrogation there were about seven years elapsed, and during that time I dare say there was no better body of men ever gotten together than the body of men who composed this founders' association, numbering in that time, I think, about 500, though they may possibly run as high as 560 shops now. In effort to evolve something from this agreement there were held at least 2,500 conferences, safely calculated, either national as committees directly from the founders' association meeting committees directly from the molders' association, or local committees from the founders meeting members of the iron molders' union, and always directed and controlled by the national.

It was my pleasure, I will say—because I rather enjoyed it—and my duty to sit in at least 150 of those committees. When we first started out with this agreement for a little while I thought all of us rather felt we might accomplish something by it, that an exchange of ideas between us was helpful, that we saw things in a little different light, that both were benefited thereby. But after a while that condition changed, and instead of it being a means to promote industrial peace it proved a means of serious conflict. During the period of its existence I think there were at the least calculation 150 shops struck. We would exhaust every means at our command to agree by virtue of this conciliation, and then we would deadlock. Beyond that we could not go. This condition became so strained, the foundrymen feeling that at the expiration of about three or four years of this attempt that we were making no progress, that we decided to take some definite action. When I became an officer of the association, which by the way was in 1903, my directions from the council were to use every effort in the world that was at all consistent with business conditions to arrive at some method of settling these difficulties. We had had two many of them. We had become tired of chasing each other around the country holding conferences by virtue of that agreement. They urged that

wherever I had an opportunity to do so I should request and urge to the best of my ability that we bring in the odd party and arbitrate.

It might be interesting to this commission to perhaps a little later on detail some of the efforts which I made to get an arbitration. But in every case, without one single exception, the iron molders' union, international or local, refused arbitration, refused to bring in the odd party. I believe the president of the iron molders' union now sitting in this room will bear me out in that statement. They would not arbitrate, for reasons, of course, which they thought were proper; there is no doubt about that.

This thing ran along until we became so tired of it and it was so apparent beyond peradventure that there was nothing to be gained by this conciliation effort, that in November, 1904, we abrogated this agreement.

But prior to that abrogation and during the period of its existence there were standing committees appointed to consider a permanent agreement which would cover all of the many little differences which we had and which we could not settle. That committee met many times. The last committee consisted of two men from the molders' union and two men from our association, who had been very instrumental in bringing about these joint conciliatory meetings, and had been very prominent in them. They undertook, as a subcommittee, to frame up an agreement which could be national in character, which should cover as many of the points which we had been discussing by reason of this committee around the country. The committees finally agreed to what should be covered in a national joint agreement, first, to cover machinery and jobbing foundries. The members of the founders' association, by way of its council, approved the actions of that committee. The committee of molders, for some reason which we do not know, of course, were not able to get its approval, and the agreement never went into effect. The last conference that was held to attempt to secure this joint agreement, national in its character, covering all the points of dissension between the two bodies, was held in Detroit in the spring of 1904. It lasted four days and four nights. I think we had eight members of the Founders' Association there, various employers of laborers, and those who represented smaller foundries. We had also there an equal number from the iron molders' union as delegates, and also 28 business delegates of that union. As I have just said, we devoted four days and four nights to an effort to arrive at an agreement, but after spending the two days of it we referred it to a subcommittee. That subcommittee devoted nearly two days more to it and reported they could not agree.

It seemed to our people at that time that they had gone about far enough in this effort to conciliate. Arbitration had failed. It could not secure the things which we felt were our rights without a conflict; so at that time they adopted an outline of policy. That outline of policy was guided almost entirely by the provisions of the joint agreement which the two parties had attempted to secure.

If you please, I would like to refer to two provisions of this association. I will endeavor to boil it down as short as possible. This is the constitution and by-laws, and the purposes of this association are described in these two paragraphs:

"The objects of the association are, first, the adoption of a uniform basis for just and equitable dealings between the members and their employers, whereby the interests of both will be properly protected.

"Second, the investigation and adjustment by the proper officers of the association of any question arising between members and their employees."

That, gentlemen, was the object of this association as originally drafted by the first committee designated for that purpose. It has never been changed.

The outline of policy of the association was changed somewhat at the conclusion of the failure of these joint committee to arrive at a standard national form of agreement; first, it refers to those points of difference between the iron molders and the National Founders' Association. These are things upon which we disagreed, and the language that I will now read to you, covering the things we could not agree on is very largely the language of the contract which the committees formally agreed to.

The first item is "Limitation of output."

The second item is "Limitation of man's earning capacity."

The third item is "Fines and restrictions."

The fourth is "Method of employment."

The fifth is "Freedom of employment."

The sixth is "Relation of employees."

The next is "Apprentices."

The next is "Appliances."

The next is "Strikes and lockouts," and the next is "Arbitration."

The last reads as follows:

"The above principles being absolutely essential to the successful conduct of our business, they are not subject to arbitration. In case of disagreement concerning matters not covered by the foregoing announcement, we advise our members to meet their employees either individually or collectively, and endeavor to adjust the difficulty on a fair and equitable basis."

The next is "Method of arbitration."

"In case of inability to reach a satisfactory adjustment we recommend that the question be submitted to a board of arbitration consisting of two of the employees and two persons engaged in the management of the firm or corporation involved, and in case they fail to reach a satisfactory agreement within seven working days, a fifth member shall be chosen by the four, and a majority report of the board so constituted shall be final and binding."

In order to receive the benefits of arbitration the employees, or employee must continue in the service and under the orders of the employer pending a conference and decision.

In case any member refuses to comply with this recommendation within thirty days after the dispute arises, he shall be denied the support of this association, unless it shall approve the action of said member."

The next is "Wages," as follows:

"Employers shall be free to employ foundry operators at such wages as may be mutually agreed upon, said rate to be governed by local or shop conditions:

"The operation of piece work, premium plan of contract system now in force or to be extended or established in the future, this association will not countenance any conditions of wages which are not just or which will not allow a workman of average efficiency to earn at least a fair wage."

You understand from that that this question of wages and the hours of labor are the two things which we attempted to get arbitration on. There is nothing of such vital interest to a workingman as his wage scale; that outweighs all others to him by 90 to 1; the question of wages outweighs the entire list of grievances that these men sometimes place before us.

Now, in order for this association to again commit itself to arbitration, they passed this resolution:

Whereas it has become necessary to withdraw from the positions of the New York agreement for the reasons announced in the declaration adopted by this convention, and

Whereas the outline of policy adopted by this convention provides means for the settlement of difficulties which may arise between our members and their employes upon subjects other than those which we believe and have announced as indisputable,

Be it resolved, That we hereby announce our continued beliefs in the principle of arbitration and our disapproval of strikes or lockouts, and instruct our officers and administrative council to favor arbitration with our employees, either singly or collectively, whenever and wherever it will enable them to establish and maintain just and equitable relations between our members and their employees."

Commissioner DELANO. What was the clause about limitation of output? Will you read that?

Mr. BRIGGS. I will read the whole thing if you like it.

Commissioner DELANO. No. I don't want that, but I would like to have that paragraph read.

Mr. BRIGGS (reading): "The limitation of output: Arbitrary limitations of output on the part of the molders or arbitrary demands for an excessive amount of output by the molders on the part of the foundrymen, being contrary to the spirit of equity which would govern the relationship of employer and employee, all attempts in that direction by either party—the molder or foundryman, are to be viewed with disfavor and will not receive the sanction of this association."

Commissioner WEINSTOCK. That is in the nature of an agreement.

Mr. BRIGGS. That is the constitution and outline of policy of the founders' association?

Commissioner WEINSTOCK. Does it not bind the union at all?

Mr. BRIGGS. Not at all.

Mr. THOMPSON. Will you file that with the commission?

Mr. BRIGGS. Yes.

(The document from which Mr. Briggs read the foregoing extracts was filed with the commission and marked "Briggs's Exhibit 1.")

(Here, in response to numerous requests on the part of the commission, several copies of Briggs's Exhibit No. 1 were distributed to the members of the commission.)

(Briggs Exhibit No. 1, "Constitution and By-Laws of the National Founders' Association, Detroit, October, 1911," was submitted in printed form.)

Mr. BRIGGS. There is a statement I would like to make here now, Mr. Chairman, if the commission please, and that is that you can not overestimate the effort that we put forth in an attempt to secure arbitration, just at the time that we realized that our attempt at conciliation was a total failure, we intensified that effort and offered to arbitrate anything and everything to avoid a strike. In fact, in the language of one gentleman who sat on the committee, he said: "I will arbitrate with you the moving of a slop bucket from one end of this shop to the other; we don't want a strike; we want to avoid that," but we were turned down absolutely.

Mr. THOMPSON. In reference to your attempt to get together with the molders' union, what were the main points of difference which developed between you?

Mr. BRIGGS. I will endeavor to state those in the language of the president of the iron molders' union himself, the apprentices first. I think it is conceded by members of this commission here that the difficulty in regard to apprentices outweighs all others put together; then the molding machines, there was opposition to those; the limitation of output, the different wage rates, limitations of output, and limitations upon a man's earning capacity, and, last but not least, the question of the open shop.

Mr. THOMPSON. Was there any consideration of the question, so far as wages were concerned, of a national rate?

Mr. BRIGGS. Much consideration of it; it was discussed at these conciliation meetings to the very greatest extent.

Mr. THOMPSON. What was the attitude of the union in that regard and the attitude of your association?

Mr. BRIGGS. Well, answering that in general terms—and I will attempt to answer it specifically if you would like to have me do that—there never was a conference but that if other difficulties had been removed we would have agreed upon a wage rate. I do not think there is one chance in a thousand but that if those conditions which I have referred to here which we wanted, and which we believed are legal, right, and just, and every employer has a right to them; if they had been conceded in all the conferences that I attended—and in many of them I had authority to act—there was not one at which we could not have settled the wage rate without any difficulty whatever, and in fact the iron molders' union, in one of their publications, in May, 1906, stated that of all these strikes that we had been entering into it was not about the question of wages or hours, but conditions, and if you would like that journal I will submit it to you; I think I can find one somewhere; there was no disagreement about that.

Mr. THOMPSON. You were talking about the question of local wages in each shop?

Mr. BRIGGS. National, if you please. Of course we had local meetings, an enormous number, but the joint committee that I referred to handled that question in a national way.

Mr. THOMPSON. In these conferences did not your association contend that the wages should be different in different communities, lower in, say, a small community and higher in a larger community, that the master founder should have the right to take advantage of the local conditions of the labor market so far as his industry was concerned?

Mr. BRIGGS. Well, as the result of our national agreement which I referred to, that question was referred to the committees of the two associations to settle. We felt that that should be a question that should become probably the subject for an annual conference, instead of all over the country at one time.

Now, if you will allow me a moment on that point—we attempted at the outset in this National Founders' Association to follow the lines so far as possible of the Stove Founders' Defense Association. That association had some sort of conciliatory agreement which some people thought was very successful; but the conditions obtaining between the two associations were so different, were so dissimilar, that it was impossible to illustrate; for instance, the Stove Founders' Defense Association had something like 65 members, and

their products were confined mainly to the manufacture of stove plates. Of course there were a great many kinds of products, such as coal stoves, hot-air ranges, or something of that kind, and the amount of metal and the handling of that metal, and the skill required in producing the product was practically the same. I looked into that thing very thoroughly in 1904, when I became commissioner, and I found at that time that there were some 65 members of that association, and they had about 5,600 employees, and that by reason of the simplicity of the work they did they were enabled to control that to such an extent that they got very large wages; in fact, I think their piecework price at that time, if I remember correctly—I have some papers to show it—but I think their prices were base 60 cents plus 20 per cent—72 cents—and subsequent to that time I think they have added to that until it amounts to 91. Besides that the union permitted piecework in all its shops; they did not oppose it; perhaps it was easier to produce a piece of work in that shop as compared with some others.

Contrasted with that instead of 65 shops we had five or six hundred, and we made everything from a door key or a watch fob, weighing a few ounces, up to castings weighing hundreds of tons. We handled gray iron, malleable iron, steel bars, copper, and aluminum, and almost anything you could think of; there were absolutely no combinations in any shape, manner, or form. It was impossible to control the price; it was simply out of the question; besides which we were advised that combination was illegal if we wanted to do it—we could not even if we had wanted it—so that the matter of applying that principle of conciliation that the Stove Founders' Defense had followed was impossible; we found it absolutely hopeless.

Mr. THOMPSON. In the by-laws, on page 31, in the paragraph from which you read on wages, it says:

"Employers shall be free to employ foundry operatives at such wages as may be mutually agreed upon, said rates to be governed by local or shop conditions."

Being a part of your constitution and by-laws that practically amounts to a declaration of principle on behalf of your association, does it not?

Mr. BRIGGS. You must read with that our resolutions on arbitration, where we say that we will arbitrate that question if we can not agree.

Mr. THOMPSON. Does your association object to collective bargaining between the foundryman and his men with reference to the price of wages?

Mr. BRIGGS. No, sir.

Mr. THOMPSON. You do not insist, or rather, then, this language is not to be understood as declaring that you will deal with the individual as such alone in the determination of his wages, and that in the agreement with reference to wages the only things to be taken into consideration are the local and shop conditions?

Mr. BRIGGS. I find that question is a little complicated to answer, but I would like to cover the substance of that by saying that we stand squarely and fairly and always have stood, and the spirit in the very first paragraph of this conciliation agreement stipulates that the first thing to be done is for employer and employee to attempt to agree, and if they do not agree and they want to bring in outsiders, it will be strictly proper. Our suggestion is, if they can not agree, having exhausted all efforts at conciliation between employer and employee—if they can not agree rather than have a strike or a lockout, arbitrate.

Mr. THOMPSON. And, with reference to the question of wages, is it to be understood that this provision in your by-laws requires the employee first to individually agree with the foundryman?

Mr. BRIGGS. No; it requires him to try to agree.

Mr. THOMPSON. I mean, does it require him to negotiate individually in the first place?

Mr. BRIGGS. Preferably; but he is free to do as he pleases. If he chooses to leave it to outsiders, he can do it. This is a voluntary organization; there is nothing compulsory about it.

Mr. THOMPSON. Under this provision of your by-laws, would it be objectionable, so far as the members of your association are concerned, for the individual to deal with you through a union representative?

Mr. BRIGGS. It is not objectionable for a firm, a member of this association. If he wishes to settle his wages through the medium of the union he has a perfect right to do so.

Mr. THOMPSON. And this provision is not to be considered as preventing the employer from exercising the right to deal in that manner?

Mr. BRIGGS. He can do as he pleases.

Commissioner WEINSTOCK. Mr. Thompson, may I be permitted to interrupt?

Mr. THOMPSON. Certainly.

Commissioner WEINSTOCK. I understood Mr. Briggs to say that the agreement under which they operate was abrogated in 1904. These by-laws say 1911. These by-laws, I presume, apply to the existing conditions and not to the conditions that would prevail in 1899 or 1900 and before?

Mr. BRIGGS. If you will allow me to explain, so as to clear that up before this commission. The outline of policy says—mind you the by-laws themselves have never been changed—these first provisions have never been changed.

Commissioner WEINSTOCK. These provisions about wages; did they read just as they do now in 1904?

Mr. BRIGGS. No; I will clear you on that. In the spring of 1904, while the New York agreement was still in force, the foundrymen had decided it was useless to proceed further in regard to that agreement; they had become tired of it. They adopted that outline of policy that was in force in May, prior to the abrogation of the New York agreement in November of the same year, and during the interim, after we had announced this outline of policy up to the time we abrogated the agreement, we continued to hold conferences whenever we were asked to, by virtue of this agreement.

Mr. THOMPSON. The reason I asked this question is that the ordinary construction of the language here, in my opinion, would preclude a member of this association from engaging in collective bargaining with his employees.

Mr. BRIGGS. That may be your construction, but, as a matter of fact, it is not correct.

Mr. THOMPSON. I want to get at your construction.

Mr. BRIGGS. Yes; as a matter of fact, it is not correct.

Mr. THOMPSON. It reads here that the said rates of wages are to be governed by local or shop conditions; what is to be understood by that condition?

Mr. BRIGGS. Well, that depends very largely, you know, upon the shop you are in. If you are in a shop making, say, a coarse kind of work, work that does not require a great deal of skill, perhaps a shop—and, by the way, many of these shops are very small, with only 10 or 12 men, sometimes only 4 or 5, and in many of these shops the men in these shops are stockholders of the shops; they own them; but they may be working on a very simple kind of work, building plates, perhaps washers and sash weights, and that sort of thing, requiring no great deal of skill. Their trade may be confined to a very narrow radius; that is a local condition and it should be governed and the wages paid under those conditions, and we recommend that those conditions be considered in fixing the wages, and that they be equitable, as required by those conditions. Then you go into a larger shop, in a larger community, where workmen have to travel a great distance, and have to pay street-car fare, and go perhaps half an hour or an hour, and the work is difficult and intricate and arduous, and there you have an entirely different set of conditions, and those conditions should be taken into consideration in fixing wages, and they are so taken.

Mr. THOMPSON. Do you believe that an employee has a fair opportunity to get a proper wage where he is compelled to deal individually with the employer with reference to the wage question?

Mr. BRIGGS. I think he has a very much fairer opportunity on the average than the man who has his wages fixed by the union, very much fairer; and you want to bear in your mind—if you are analyzing that situation—you want to bear in mind when you are dealing with this question of union labor that you are dealing with a very small percentage. There is only 2.41 of the people in the United States that are unionized, and you can not consistently go and legislate and conciliate, or anything of that kind, for a percentage of 2.41. You must consider the rest of them.

Mr. THOMPSON. Very true; but you mean, in regard to that little less than 3 per cent—when they come together and deal collectively—that they get lower wages than they would get if they dealt individually with their employer?

Mr. BRIGGS. Now, we must understand that word "collective." You can use that word very broadly. Collectively may mean the National Founders' Association dealing with the iron-molders' union, and using the word "collectively" may mean a proprietor with 10 men working for him getting those 10 men together and dealing with them collectively. Now, taking the latter condition—of the proprietor being allowed to get together with the 10 men and settle wages as he pleased—they will get better conditions and better wages than by dealing through the intervention of the iron-molders' union.

But I would like to make a little statement that our people believe, and I believe it intensely, that this question which you are attempting to cope with is not a question of unionism or nonunionism, absolutely not. You can not find a stockholder in our association, and there are thousands of them, that objects to unionism just because they are unions. The question is good and bad unionism, and that is the whole question. Nobody objects to unionism, nobody objects to a man coming into his shop if they will come in and allow the shop the rights that the proprietor has granted him by the Constitution of these United States to run that shop under certain conditions; if any union man wants to come into a shop on that basis, he is not an intruder at all, he is welcome.

But the difficulty is that the vast majority of the Federation of Labor unions, of which the iron molders is one, do not take that attitude. They demand the limitation of apprentices, and they say "you shall not work piecework, you shall not use improved appliances," which lessen the labor of the workmen tremendously and increase output. They demand that you shall not use those machines. They demand that you shall discharge every nonunion man or they will close the shop. That is the attitude in which they approach you. There is a great big line of demarkation between good unions and bad, and I myself characterize them as open-shop and closed-shop unions. I take my hat off to the open-shop unions of this country, headed by the conductors and engineers, or the engineers and conductors, just as you please; I put them in the same class, they are purely open-shop unions. They have never allowed a strike to occur in this country since 1894, and I do not believe that was due to the present management of the unions; they have always found some way to arbitrate these questions, some way of avoiding this turmoil and turning things bottom side up, and they have got at the arbitration proposition. The majority of labor unions I class as bad—of course, there are some good—but I have dealt with 26 of them, and I have never found one that did not object to these limitations that I have described, which in the eye of the law is illegal. A union man approaches you in your shop and demands that these things be complied with at the very outset. Now, that is not the spirit of harmony; that is not industrial peace; that is industrial difference of opinion and out of that industrial condition has come about this turmoil.

Believe me, it is not a question of laws that we want, not a question of more legislation; what we want is obedience to our present laws, and if this Government would enforce obedience to our present laws, I assert that that little conciliation agreement there could be used absolutely to the greatest advantage.

Let a man educate all the apprentices he pleases. In that strike I had in my own shop, the cause of that was that I educated my apprentices too well. The only reason was that I educated them too well. I dealt with the president of the union the night before they went out—

Mr. THOMPSON. Was that the reason you went out of business?

Mr. BRIGGS. No; it was the reason we had a strike. I talked with the president of the union before they went out, May 20, 1901, and I asked him why he was going to order the strike, and he said: "You are treating your apprentices too well." Now, why was that? My apprentices were handled in this way: First I had an instructor over them, who spent all his time with them. I gave him ten apprentices to handle, and he taught them everything he could; his time was their time, and it worked out beautifully. Now, No. 2. Up in that country, in Minneapolis, we had difficulty in getting high-grade machinists. There was a great demand for them at that time, and had been for years before, to get men that were fully up-to-date, highly educated, and who could read drawings, for example. We could not find them, so we instituted a system of educating them, and we provided an instructor, and as a rule they were indentured, and one of the features of that indenture was that they spent nine months out of twelve, two hours of the evening with the instructor, and we taught them to read drawings, and they worked those evenings on work that was constructed in the shop, and they enjoyed it; they liked it, and they became proficient and made good men; and the unions struck my shop May 20, and the only reason that they struck the shop was that I was educating these apprentices too well.

Then I came at them with that agreement which we had of the metal trades, which was similar to that New York agreement—copied almost word for word from that. I said, "Boys, we will call for a conference under this agreement; let us submit it to the two associations," but they said they didn't think they could wait for a conference, and the next day I was without any men except

three nonunion men that stood by me. That was the result of attempting to agree by way of these closed-shop unions.

Mr. THOMPSON. You have stated that you do not believe that an employee through the organization could better his wage condition in shops where, say, 10 men are employed—I think that was the number you used. What would be your opinion with reference to the larger shops, running all the way from 10 to 10,000?

Mr. BRIGGS. Well, the modern method of handling these large shops is to have most competent men to devote all their time and attention to labor conditions, and my observation is that in the large industries, almost without exception—there are exceptions, of course, to all these rules, but the exceptions are few—my observation is that by reason of these men whose sole effort is going to be to deal with these men, that they would get good conditions and good wages.

I want to state right there the thing that actuates us a little bit is that the condition of the wage earner in these United States is the best of any place on earth, and conceded to be so by everybody. That was not brought about by unionism; 2.41 per cent can not accomplish that. That is brought about by people studying this question; by people inspired with the idea of fair play, the same as the people were who drew this conciliation agreement and held 2,500 conferences under and by virtue of it in an endeavor to meet the unions on their own conditions and failed.

I believe that more increased wages and shorter hours, talking about mechanical institutions, are obtained by way of the employer and employee getting together than by virtue of any union interferences.

Mr. THOMPSON. Then, in your opinion, the unions which are associated with the American Federation of Labor, as a matter of fact, as far as wages are concerned, are of no benefit to their members?

Mr. BRIGGS. I think they are a curse.

Mr. THOMPSON. And any expense they are put to in maintaining such organizations is worse than lost money?

Mr. BRIGGS. That is my opinion; but I want you to bear in mind that if they will eliminate a portion of their rules that have been declared illegal, and which they try to force upon us, they would meet the proprietors in a much more friendly spirit and would be received more kindly.

Mr. THOMPSON. What is your idea of the purpose of more than 2,000,000 people who belong to these unions; what is their idea in joining them?

Mr. BRIGGS. If you are going to answer that question intelligently, you must analyze the conditions to the extent of finding out what class compose these unions, and you will find that a very large number of that 2,000,000, if I understood Mr. Mitchell correctly this morning, I should say he claimed something like 600 or 600,000 were coal miners.

Mr. THOMPSON. No; 400,000.

Mr. BRIGGS. I stand corrected, if that is correct.

Commissioner WEINSTOCK. Seven hundred and fifty thousand now; there were 400,000 in 1897.

Mr. BRIGGS. There is over one-third of all the kinds they have, and they want to apply conditions—

Commissioner WEINSTOCK. Here are the facts: In 1890 there were only 90,000 organized miners out of 400,000; at the present time there are 750,000, and 525,000 of them are organized.

Mr. BRIGGS. Very well; I guess we have it correct now. There is over a quarter of all of them.

Commissioner O'CONNELL. A quarter of all the miners?

Mr. BRIGGS. No; a quarter of the American Federation of Labor.

Commissioner WEINSTOCK. The miners represent a quarter.

Mr. THOMPSON. I am taking it from Mr. Hayes; I thought he said 300,000 anthracite and 450,000 bituminous.

Mr. BRIGGS. Now, the main point: It is absolutely impossible to prescribe a set of rules that will apply to these people whose labor is all so universal and common, and all that sort of thing, and in a mechanical institution where you have all varieties of labor, from unskilled up to the very highest skilled, those principles will not apply.

Mr. THOMPSON. Let me put this proposition, so that we will not waste time on the unintelligent class. Take the typographers, the typographical union. It is composed of men whom I assume must be intelligent; must be able to read, write, and punctuate and understand English thoroughly; what would be your idea of their reasons for maintaining their organization?

Mr. BRIGGS. I do not think my opinion on that proposition would amount to very much, because I am not familiar with conditions prevailing in their trade.

Mr. THOMPSON. You said that the maintenance of these institutions is a mistake by people, that it does not help them?

Mr. BRIGGS. I do.

Mr. THOMPSON. You must have some opinion in regard to why such a body of intelligent men would maintain an organization.

Mr. BRIGGS. Well, a man can give his opinion on these things, of course. This is my personal opinion; not the opinion of the National Founders' Association which I was called here to represent. I think at the present time the greatest effort of these men is to hold an organization, without drifting a little as to the purpose of the organization.

Mr. THOMPSON. Your opinion in regard to the unions, which are part of the American Federation of Labor, does not apply to these trainmen's unions?

Mr. BRIGGS. No; I have the greatest admiration for the way that the conductors and engineers and firemen conduct their unions; I think they are ideal.

Mr. THOMPSON. You think it is an advantage to have that organization?

Mr. BRIGGS. Yes.

Mr. THOMPSON. It helps their wages?

Mr. BRIGGS. Yes.

Mr. THOMPSON. And hours?

Mr. BRIGGS. Yes.

Mr. THOMPSON. And conditions?

Mr. BRIGGS. Yes.

Mr. THOMPSON. In your opinion, then, it is the difference in operation between the two different bodies of men?

Mr. BRIGGS. The unions we are talking about are open shop; they will arbitrate anything. They will not strike because they put on nonunion men. The labor unions that I have had experience with, and I have had experience with 26 of them, always will, because they are a closed shop.

Mr. THOMPSON. You think the closed shop is a detriment to the unions both in regard to wages and hours and the open shop helps hours and the working conditions of the men?

Mr. BRIGGS. I most certainly do; that is my experience.

Mr. THOMPSON. What is your authority for the statement of about 2½, or whatever the percentage was, being organized workers?

Mr. BRIGGS. The commissioner of labor of Canada. I have the list here, where he has recently come out. I will admit that I quoted it from the papers. It is headed: "Comparative strength—an interesting statement contained in the report of the Canadian Bureau of Labor shows the relative standing in trades unionism of the chief industrial nations, the figures indicating the percentage of trade-union memberships to population in the case of each country as follows."

Then it starts off with Great Britain and follows with Canada. It gives Great Britain about 6 per cent and Canada about 2 per cent. We are 2.48 per cent, France is 2-plus. Sweden is next with over 4 per cent, Germany over 4 per cent. They are about the same. Austria a little over 1 per cent. Then there are several smaller countries where they are only a very small fraction of 1 per cent unionized. That is my authority. It may not be correct.

Commissioner O'CONNELL. That is to the total population of the United States, that 2.48?

Mr. BRIGGS. Yes.

Commissioner O'CONNELL. What percentage of the people who are engaged actively in industry?

Mr. BRIGGS. Workmen, you mean?

Commissioner O'CONNELL. Yes.

Mr. BRIGGS. Well, that would figure up about 7½ or 7¾, I think. There are about 30,000 employees in the United States, and it would be about one-third. Multiply that by three and you will have it.

Commissioner WEINSTOCK. Are not these figures misleading, Mr. Briggs? I got the notion that the statement was that of all the workers in the country only two and a fraction per cent were organized, but I see here that it is two and a half and a fraction per cent of the population.

Mr. BRIGGS. Yes; of the population.

Commissioner O'CONNELL. That takes in all our possessions.

Mr. BRIGGS. It takes in 91,000,000.

Commissioner WEINSTOCK. I was under the impression that of all the workers of the country it was 25 per cent.

Mr. BRIGGS. No; I think it is less than 8 per cent.

Commissioner O'CONNELL. Can you give us some idea where we can find that?

Mr. BRIGGS. I think I can find it. I can not give you the number of the bulletin, but I can get that information.

Mr. THOMPSON. Do you mean you can get it from some publications of the United States Government?

Mr. BRIGGS. I mean the information. It is stated frequently that it is less than 10 per cent. I think it was about three years ago that I looked that up, and I think I got my information from some bulletin that the Government published that showed that it was less than 8 per cent.

Mr. THOMPSON. Could you tell us what bureau or what department published that information?

Mr. BRIGGS. The Bureau of Labor would have it.

Mr. THOMPSON. Now, coming back to that association, what percentage of the industry does the membership of your association cover, and how is your association formed? What is the agreement among the members? What is the method of introducing new members, and how do you carry out and enforce any of your agreements with reference to the individual members?

Mr. BRIGGS. That is a pretty big question to cover in one answer. If you will split that question up it will probably take me a couple of hours to answer it, but I shall be very glad to go to any length you please in answering it.

Mr. THOMPSON. I am quite willing to divide it.

Mr. BRIGGS. Will you please just divide that up?

Mr. THOMPSON. About what percentage of the industry does the membership of your association cover in the United States?

Mr. BRIGGS. It would be impossible to state. We cover about 560 shops. As I have explained here before, that covers a great variety of trades. It is really every conceivable thing that you can make out of metal. I do not believe it would be possible to state what proportion it is.

Mr. THOMPSON. Have you any idea about it yourself?

Mr. BRIGGS. Based on employees, I should say that the association has about 30,000 employees represented—molders—but to the best of my recollection, there are about 150,000 molders employed in the United States, when they are working at full capacity. That, by way of comparison by way of employees.

Now, as to firms. Of course, you know a great majority of the firms, in fact, the average of the factories in the United States, is about 10 employees to the firm. Many of these people are small people. My memory is that while we have about 560 shops, there are about 60,000 foundries in the United States.

Mr. THOMPSON. With reference to your form of membership, how do you have your association carry out any decision that you make, in the membership?

Mr. BRIGGS. I do not quite understand your question.

Mr. THOMPSON. How are the decisions of your association enforced against the members? Your association, as I understand, deals with the labor proposition. That is one of the reasons for its existence.

Mr. BRIGGS. You mean the method of our treating, directly, a labor proposition?

Mr. THOMPSON. No; your method of treating one of your members with reference to a labor problem.

Mr. BRIGGS. You mean as to a standing member, admitted, or a prospective member?

Mr. THOMPSON. Yes.

Mr. BRIGGS. A member? Well, now, just as I have stated before, our advice to a member is that he use every effort to settle the questions between him and his own men. If he fails to do that, the next thing we do is to send an officer of this association to his place of business. He looks the situation over carefully, and he makes a report back. Usually that is a man who is a subordinate officer, and he reports to his superior officer. Then the form prescribed in the constitution and by-laws takes place; a committee of five—a district committee—is appointed to go to that man's place of business to look over his condition and see whether he is really justified in enforcing what he wants—what he requires. If, in my judgment, he is asking for something that is eminently fair, if he is treating his men right, if he has done all that he can do to effect a settlement, he asks for the support of the association; the report of that committee is then submitted to the council of that association, which is made

up of two men from each of nine districts—18 men—and the president and vice president of the association as ex-officio members. The treasurer is also a member of that council, in the event of an individual being treasurer. In the event of a banking institution being the treasurer, of course, that is eliminated, and it is confined then to 20 men. The report of this district committee, after having made this investigation, this inspection, is then transmitted to the administrative council, and they vote whether or not this man shall have support. If the case is one involving a large number of men, a meeting is called of this entire council. Years ago we used to have lots of them—four and five a year. They take that up and adopt it. The man goes before the council and presents his case, and after it has been most thoroughly examined, if he is entitled to the support asked, it is voted to him.

Mr. THOMPSON. But in case a member refuses to carry out some decision of your council, or any other authorized officer or body of your association, how is he disciplined, or how is he forced to carry it out?

Mr. BRIGGS. He is refused support.

Mr. THOMPSON. Is that the only method you use to enforce the decisions of your officers?

Mr. BRIGGS. It is a voluntary association. I do not think, as a matter of fact, that question has ever come up, prior to difficulties. We have on many occasions been presented with a petition for support and upon investigation we have found that the man was not treating his men right, and we urged him to change front, and we would not support him, and as a rule after you have exhausted your means that way, nearly every manufacturer, you can, by working with him, get to do the proper thing. That is what we try to do.

Mr. THOMPSON. But if he does not do it, you have no power to compel him to do it?

Mr. BRIGGS. Deny him support or expel him. We can expel him if we wish to.

Mr. THOMPSON. I mean denying him support or expelling him; that is the only power you have?

Mr. BRIGGS. Yes.

Mr. THOMPSON. What is your method of handling labor associations at present?

Mr. BRIGGS. Do you refer to strikes?

Mr. THOMPSON. Yes; to strikes.

Mr. BRIGGS. You refer to a time when all these preliminary efforts have been exhausted, and we can not make a settlement and a strike ensues?

Mr. THOMPSON. Yes.

Mr. BRIGGS. There are three methods. You gentlemen have the constitution, which provides them, and without reading the entire contents of it, they are briefly these: One method is to supply the men. Another method is to secure work in some other shop for them. Another method is to pay them a certain stipulated amount, or a certain amount that shall be agreed upon, rather, for idle floors while they are shut down, and the association members club together and put up a little bunch of money and help them in that way.

Commissioner WEINSTOCK. I am a little confused on a statement that has been made here, and I should like you to set me straight.

Mr. BRIGGS. I should like to do so.

Commissioner WEINSTOCK. On the one hand I was led to believe, from what had been said before, that in 1904 the New York agreement had been abrogated.

Mr. BRIGGS. Yes.

Commissioner WEINSTOCK. I gathered from that, somehow, that you were principally operating with nonunion help.

Mr. BRIGGS. Oh, no.

Commissioner WEINSTOCK. You are operating with union help?

Mr. BRIGGS. We operate an open shop, strictly.

Commissioner O'CONNELL. They are operating without an agreement.

Commissioner WEINSTOCK. You recognize the union, do you, now?

Mr. BRIGGS. No, sir.

Commissioner WEINSTOCK. You do not recognize the union?

Mr. BRIGGS. No, sir; we have no negotiations, you understand. This association has no negotiations.

Commissioner WEINSTOCK. Locally, have you?

Mr. BRIGGS. Occasionally our members have. We do not deny them that right.

Commissioner WEINSTOCK. If you do not recognize the union, how can you arbitrate with them as you say you do?

Mr. BRIGGS. We do not arbitrate. They will not arbitrate with us. Absolutely, gentlemen, they will not arbitrate with us. I bear witness to that, and I wish that I was under oath.

Commissioner O'CONNELL. Do you not say in here in several things that you will not arbitrate?

Mr. BRIGGS. I do now.

Commissioner O'CONNELL. Do you not say in here that in several things you will not arbitrate?

Mr. BRIGGS. I do now; but, mind you, I want to be clear on that point. Pending this seven years and pending this conciliation agreement the foundrymen went to the greatest extreme and said, "Gentlemen, we will arbitrate anything and see if we can not get some sort of an agreement here," and, absolutely, they will not arbitrate. Having spent seven years and a great number of conferences in attempting to do that, the foundrymen felt that it was about time for them to take some sort of a position, and they said, "These conditions which the officers of the association agree to we propose to support our members in. They are strictly legal and lawful—and according to the best attorneys that we can get they are—and we propose to support them so long as they conform to the State laws." Then this was adopted in May, and when November came around—we have had no negotiations since November.

Commissioner WEINSTOCK. Since last November?

Mr. BRIGGS. No; since November, 1904, we have had no negotiations.

Commissioner WEINSTOCK. Now, you have had what is called an open shop. You do not ask questions when men apply to you for work?

Mr. BRIGGS. No, sir.

Commissioner WEINSTOCK. Supposing the men in your shop made an organization as a unit and came to you in order to discuss certain grievances, what would happen?

Mr. BRIGGS. Well, that is entirely optional with the workman himself. The national body has no arbitrary rule about that at all. They can do just as they please.

Commissioner WEINSTOCK. As a rule, what has been the practice? Will the founder recognize that body?

Mr. BRIGGS. Subsequent to 1906 it has been estimated that there are perhaps 16 per cent of our people that do negotiate with the union, and the balance do not. They find it more advantageous to both the employer and the employee not to negotiate with them.

Commissioner WEINSTOCK. That is, not to recognize them?

Mr. BRIGGS. Yes.

Commissioner WEINSTOCK. So that the 85 per cent, if a committee came to them representing their own workers wanting to discuss matters, would not recognize them as a union?

Mr. BRIGGS. I should like to be sure I understand that question. You say a committee from their own workers?

Commissioner WEINSTOCK. Yes.

Mr. BRIGGS. I do not think any member of the foundry association would object to meeting a committee of his own workers. But, mind you, the union does not send a committee of that kind. They send a man that is an outside man in there.

Commissioner WEINSTOCK. And those you do not recognize?

Mr. BRIGGS. No; we do not recognize them in negotiations. Some of the members have done so.

Commissioner COMMONS. Eighty-five per cent do not, you say?

Mr. BRIGGS. Eighty-five per cent do not.

Commissioner WEINSTOCK. Pardon me, Mr. Thompson, for interrupting you. Go right ahead.

Mr. THOMPSON. Are the wages and conditions in shops of the National Founders' Association better or worse than the wages and conditions of working in shops under arrangement with the union?

Mr. BRIGGS. That is a mere matter of opinion. My opinion is that they are much better; and if you would allow me I should like to touch—pardon my presumption here—I do not want to fail to touch this apprentice question most thoroughly, and the question of the molding machine.

Mr. THOMPSON. I should like, first, before we get to that, Mr. Briggs, to ask you about something else. I am perfectly willing to go to that, but I want to

get as complete a statement from you here as possible. You spoke of supplying men to the foundrymen in cases where there is a strike. What are the conditions and arrangements with reference to the supplying of those men? How are they supplied and where are they gotten from?

Mr. BRIGGS. We have continuously employed a number, varying according to the conditions of business, of foundry instructors, molder instructors, and when a cessation of work takes place in a shop and nobody is there we send a certain number of those men to that shop and bring in unskilled men and train them as molders. Occasionally we pick up molders in one part of the country and send them to another part.

Mr. THOMPSON. About how many men does your association keep in that way?

Mr. BRIGGS. That depends entirely upon the conditions prevailing. I could not tell you exactly without referring to the records.

Mind you, I have been out of office since last November, and I have not reviewed this, and I could not answer that question without looking it up; but if you would like to have it answered, we will supply it to you gentlemen.

Mr. THOMPSON. Have any of the members of your association agreements with the unions?

Mr. BRIGGS. I think they have; some of them. They are included in the 15 per cent I referred to.

Mr. THOMPSON. There is nothing in your association that would prevent them having interviews with the individuals in the industry?

Mr. BRIGGS. No, sir.

Mr. THOMPSON. In the agreements that a member of your association makes with the union must he insist upon any of these conditions that are set forth in your by-laws?

Mr. BRIGGS. That is entirely optional with the man who makes the agreement. The national body has nothing to say about it.

Mr. THOMPSON. Then, the constitution and by-laws of your association is more or less a direction as to the wise thing to do rather than a compulsory rule?

Mr. BRIGGS. The association is voluntary, absolutely and in every particular. There is nothing compulsory about it.

Mr. THOMPSON. Would not a man be expelled if he did not carry out your by-laws?

Mr. BRIGGS. Well, in some regards, of course; but we do not have much difficulty with them. We are very careful about that. If a man is unreasonable with his workmen, we do not take him in; we will not have him.

Mr. THOMPSON. Suppose a man made a closed-shop agreement with the union, would that be such a violation of the by-laws as would lead to his expulsion from the association?

Mr. BRIGGS. You are speaking generally now from the general principle involved here?

Mr. THOMPSON. No. Would there be a power in the association to expel him; and, next, what would they be apt to do?

Mr. BRIGGS. There is a power to do it, but in actual conditions we do not expel a man, because there has never a case arisen where they ought to. I assume what you are getting at, and want to get a short cut to it, is you are referring to a contract that is entered into between the founders' association and a man whose men have struck?

Mr. THOMPSON. No; I want to say that I have nothing specific in view at all.

Mr. BRIGGS. I was just asking because the nature of your questions led me to believe that.

Mr. THOMPSON. No, indeed; I do not know of any such conditions that exist.

Mr. BRIGGS. Where a man wants support, and we go out and investigate and vote him support, after having gone through all that I have stated here, one of the conditions of his having support is that he runs an open shop for one year.

Mr. THOMPSON. When you say, for instance, that a member of your association has the privilege of contracting now with the molders' union, is there any understood objection among the members of your association to so contracting?

Mr. BRIGGS. The general impression among our people individually is that to contract with the iron molders' union is a mistake. They would not advise it. Eighty-five per cent would advise against it. Eighty-five per cent would advise against it, believing that they get better results otherwise; but in some

particular locality where the union has made perhaps special agreements with a man it may be advisable, if he gets better conditions, and if he wants to, it is optional with him.

Mr. THOMPSON. When a member of this association has made such an agreement he would not be considered as breaking the faith?

Mr. BRIGGS. Oh, no.

Mr. THOMPSON. If, in your opinion, the union associated—I am only using that word as you have used it yourself—avails to get the best wages and the best hours for its membership and the best working conditions, what is the objection on the part of your membership to dealing with the union?

Mr. BRIGGS. If you will allow me now to touch upon that apprentice and molders' machine question, in the language of the iron-molder's union, and in the language of Mr. Commons, in the beautiful book that you published, on the part of the Government, the apprentice matter has caused more difficulty than any other point. I think that is the exact language that Mr. Commons and Mr. Frey used. You published that document, and I agree with you exactly, and in that document they say also that the reason for the ratio of apprentices has never been discovered. They do not know. As a matter of fact, you can not fix a ratio of apprentices, so many to a certain number of workmen, applying uniformly all over the country and in all trades, that will be fair. You can not do that; and in my judgment it is not necessary to have any union to do that, because that is a question that is fixed by law, as to what you can do with an apprentice, and there are natural limitations applying in every shop. The union attempts to force a uniform rule, and that ratio is based upon guess. I have tried several times to find out, and the only reason that was ever given me was that when the people were considering this question they felt, and the union felt, that they ought to have a ratio assured, a limitation, and nobody knew what it was, so that they adjourned from the convention and shook dice and that the result of the dice established the ratio of apprentices. That is the only reason I have ever heard. I do not know about the truth or falsity of that, but that is what union men have told me was done.

Commissioner O'CONNELL. With who were they shaking dice?

Mr. BRIGGS. I do not know. That is the way it was given to me. That is the only reason for that ratio of apprentices that I have every heard. There is a limit of the ratio of apprentices and that is fixed by the conditions of a shop. Here is a shop here which has a certain line of workmen, and has certain foremen who are good men, but they have not got ability to impart their knowledge to a student, which is so necessary for a teacher. The same problem is before our schools; they can not get good teachers, not because the teachers do not know anything about the subject, but because they can not impart the information that they have to anybody else. There is the greatest difficulty. The men in that shop, and the shop foremen, will not educate one of these apprentices. They do not want to, and if they do they will educate him strictly along union lines, generally.

Over here there is a factory where they say, "Here is a good foreman, and he likes to teach boys, and he will teach them, and he has a gang boss and another molder here who likes it and likes boys, and we will make proficient men of these." In this shop you can work a large number of apprentices, whereas in the first shop you can not. Hence the absolute futility of fixing a uniform ratio of apprentices. You can not do that. That is where the trouble comes in, and in a great strike like the one we had in 1906, practically the only question that was at issue in the main center of the difficulty, Milwaukee, was over that matter of apprentices. The union ratio had been enforced to such an extent that there was a dearth of molders. It has been estimated, I think, from the quotation that was given, that I have just referred to, and from actual practice, that if that ratio were maintained for, say, 20 years, the molding trade would be extinct; there would be no molders to perform the work. They were driven to extremities at that time. The shops were all struck, and they turned them all into training schools, and they broke in 1,200 men in Milwaukee alone as the result of that. That is one of the things that, as has already been said, outweighs all other conditions altogether.

No. 2 is the molding machine. The unions have always opposed the molding machine. Molding machines are facilities for making castings. It is easier for a man to make a casting with a molding machine than it is without it. It does not require so much hard labor, and it increases the capacity. The iron molders have fought molding machines from the time the molding machine

was started until the present time. If you put an iron molders' union man onto a molding machine he will make as many castings on that machine as he can make without it. I know that to be the case, first, because it occurred in my shop, and second, because I have seen it in hundreds of other shops. He will not do more than that, if he is a union man. If you get a nonunion man and put him on it he strikes your shop. What could the proprietor do? Absolutely estopped from educating more men at that time; estopped from putting in more approved machinery and appliances and being able to supply their orders, and that sort of thing. The next thing, the union struck those shops—every one of them. As a matter of fact, in most cases you can increase your output with the molding machine anywhere from 2 to 40 times. I would not begin to tell you how much more you can produce with a molding machine, but it is a tremendous lot.

Now, a man in this country ought to have the right to use that machine if he wants to, and get that vast result out of it, and I submit it to you gentlemen that if a man wants to do that—in the case I am referring to now it cost me \$5,000 to fit up to make pulleys, and we could make three of those pulleys without the machine, and usually we could make eight with the machine. I tried one union man after another, until I had had seven on it, and my price was based on seven pulleys—and I was competing with people who had not this difficulty. Finally, I had a little bit of a brush about it, and I put a nonunion man on the machine, and the first day he put up seven pulleys, and the next day nine; and his average was nine. What is a man going to do under those circumstances? I think a proprietor is justified in asking to be permitted to run an open shop.

Mr. THOMPSON. Would you be willing to furnish the commission with the number of strikes in the shops, members of your association, of last year, and the causes of those supported and those nonsupported; where they were supported, giving the reasons for the support, if any.

Mr. BRIGGS. Yes; over any period you please. If you want to extend that over the entire period of the existence of the association, I will be pleased. I am speaking now without the authority of the association, but I am an ex-president, and I know how they feel about it, and I know that they will be glad to furnish that.

Mr. THOMPSON. I wish you would furnish it.

Mr. BRIGGS. Mr. Taylor, will you make a note of that? They want a list of all these strikes, and all that sort of thing. Will you let us have the whole thing for this commission?

Mr. THOMPSON. Mr. Chairman, that is all.

Commissioner DELANO. Mr. Briggs, I understood you to say that you tried to work under the trade agreement with your association for a period of seven years, and finally you abandoned it in 1904, and since then you have gone on for 10 years without any trade agreements. Do I gather from that that you have had better success without a trade agreement than you had with it?

Mr. BRIGGS. Infinitely better. Perhaps I could best give you proof of that by saying that that question has come up for three years, after 1906, at our national convention; and the same outline of a policy was adopted, without a dissenting vote, and there were present at every one of those meetings about 200 of our members, and at the last two conventions it has not been even mentioned. There is not a dissenting vote in our association on that proposition.

Commissioner DELANO. If you were on this commission and trying to answer the questions that we are expected to answer, to find a way to secure industrial peace, you would not suggest the trade agreement as the way?

Mr. BRIGGS. I should not, for our enterprises. I should most certainly be opposed to it.

Commissioner DELANO. And yet you did intimate that trade agreements with some unions, under some bases, were all right.

Mr. BRIGGS. I do, and I believe that, and our association believes it sincerely and honestly. We are committed to it, over and over again. Our belief is that a closed-shop union is absolutely illegal. They have no right to make such an agreement in the first place. It does not work out in the second place.

Commissioner DELANO. You have spoken of the injustice of the limitation of apprentices; and yet I understood you to say that there is some basis of limitation of apprentices, although nobody has as yet discovered what that scientific basis is. Did I get that correctly?

Mr. BRIGGS. Not exactly. I would say that the way to establish a limitation of apprentices is not by the way these unions attempt to establish it. I think you will agree with me, Mr. Delano, that nearly every State in the Union years ago had a law limiting apprentices. I recall one which says that if a master apprentices a boy to learn a trade—that was at a time when he usually took him home and he became almost a father to him—he must give that boy a certain education, in mathematics, for instance, and I think the limit of that mathematical education was up to the rule of three that our fathers used to talk about; and by way of the State laws those limitations are regulated. It is not the part of the employer or the employee to regulate that. It is regulated in that way. But I have made proposition after proposition to these gentlemen sitting right over there, that if they would draw the provision for the education which any manufacturer should grant these apprentice boys just as strong as they pleased, they could get a Philadelphia lawyer—I have used that expression many times—to draw those limitations, and they would allow the employers to educate all they wanted, and under that agreement we would accept them. They will not accept them.

Commissioner DELANO. But suppose two of your members, one of whom was employing that 10 or 15 per cent of apprentices and the other employing 40 or 50 per cent, would they be able to compete in a similar class of work?

Mr. BRIGGS. That is a question. In the first stages of those apprentices probably they would not. But after they get into the fourth year they would, and I should like to add one word to that, Mr. Delano. I am bothered over this question because I have been at it so much, but do you not know that all this talk about a vocational education, and efficiency and scientific management, is the result of the inability of the manufacturer to educate apprentices?

The place for a boy to learn a trade is in a shop. You can not teach him a trade in a school—not a bright boy. You can not do it. Manual training up to a certain extent and vocational training up to a certain extent will classify these boys. It will sift out those who have mechanical ability. Then you must turn that boy into the shop. That is the place for him to learn the trade. You can not teach him that in a school.

Commissioner BALLARD. If a shop had a number of apprentices, might it not be a temptation on the part of the employer to lay off his older, tried men, who probably would have families to support and must get larger wages, and supplant them with those apprentices who would work for smaller wages, and might not that injure the interests of the older men?

Mr. BRIGGS. Possibly it might, but I do not think so. I do not think it is an injury to any boy to teach him a trade, and I do not think it is objectionable for any manufacturer to spend his money in teaching a trade in his own shop, as opposed to contributing about every three weeks, as we are now asked to contribute, for some vocational education. For my own part, I would rather spend that money in my own shop in teaching my own men in my own way.

Commissioner BALLARD. Did you have trouble on account of the union men refusing to handle material made in the nonunion shop, refusing to handle material or tools, or anything of that kind?

Mr. BRIGGS. We had some trouble. The greatest trouble was when they were asked to make castings for a nonunion or other struck shop. Occasionally when we asked union men to make castings for a nonunion shop where there had been other difficulties, they refused to make them. That is quite a common thing.

Commissioner BALLARD. You speak of good unions and bad unions. What two or three things do you feel specifically that the American Federation of Labor do that if they were eliminated you would feel friendly toward their organization?

Mr. BRIGGS. First, I would say remove limitations on and opposition to apprentices. Second, I would say remove their opposition to molding machines and improved appliances. Third, I would say their habit of fining certain of their members for exceeding their limits, which they themselves have set, and limiting the output, which they do time and again. Again, I would say where they enforce a minimum wage, frequently they cause the proprietor to lay a man off because he is old, and although he is a good, honest man, he can not earn the minimum wage, and he begs to be taken on, and the union says, "No; you have got to earn the minimum," and he can not. Let them remove that, which does great injustice. Talk about Christianity and justice and that sort of thing, if that does not come in there, I do not know where it does. I can cite you case after case, if you want it in the record, where that has been done.

Then there is a fellow that is not fully skilled; there is many a well-disposed boy, a splendid boy, a boy that likes to work and do the best he can, who cannot rise to the level of the man who earns this minimum wage; and that boy would not be kept on and would not be allowed to work at his trade; or else the proprietor has got to turn a good man down so as to break even, somewhere. Let them remove that. Let them remove those restrictions. It is really illegal and unlawful to make those restrictions. All we ask of the American Federation of Labor and the iron molders' union especially is to conform to the law as it stands to-day. We will get along with them all right. The brotherhoods do that every time; and believe me, I do not believe there has been a minute for the last 15 months but what there have been bitter strikes on somewhere with the International Union of Iron Molders, or the machinists. At the same time, you can not mention a strike that has taken place, of any magnitude whatever, with those brotherhoods. They have the best-paid and the best-equipped and the best-housed men that there are in any industry in any country in the world. Why can not the American Federation of Labor adopt those same methods? Why could they not come to us and say, "Let us get at this thing on an amicable basis?" Talk about industrial peace. That is the thing for them to do.

Commissioner WEINSTOCK. During the existence of your agreement, Mr. Briggs, did you work on the closed-shop basis?

Mr. BRIGGS. We worked upon any condition we could get with this union, and the biggest part of them were closed shop, absolutely.

Commissioner WEINSTOCK. You stated you had a great deal of trouble in getting along with the molders, especially, and reaching any sort of a satisfactory agreement; that they make demands which, in the judgment of the founders, were unreasonable, in the way of minimum wages, apprentices, and all that sort of thing.

Mr. BRIGGS. Yes, sir.

Commissioner WEINSTOCK. Evidently conditions east are different from what they are in my country, California. Speaking with some members of the Metal Trades Association employers, they have said to me, in relation to the molders especially, that their relations with them are very friendly and cordial and that all their differences are amicably adjusted and they get along splendidly together.

Mr. BRIGGS. Your trade out there has pretty nearly all left you, however.

Commissioner WEINSTOCK. No; that is not true.

Mr. BRIGGS. Manufacturing?

Commissioner WEINSTOCK. Yes.

Mr. BRIGGS. I apologize, if that is the case.

Commissioner WEINSTOCK. Mr. McGregor, president of the Union Iron Works, told me less than a week ago that they are employing more men than they have at any time since the fire, except a very brief period after the fire; that they are now constructing the largest vessel on the Pacific coast that was ever constructed there; that they got the contract in competition with the largest shipbuilding concerns on the Atlantic seaboard and that their bid was from \$30,000 to \$40,000 less; that they are doing it in record time; and only a few days before I left my home the statement was made public that the Union Iron Works were going to build the biggest dry dock in the world and that Mr. McGregor further made the statement that they had now more work than they can possibly take care of.

Mr. BRIGGS. I would not question a portion of that statement. You have an unusual amount of work there, due to the Panama Exposition.

Commissioner WEINSTOCK. Not in shipbuilding.

Mr. BRIGGS. A member of your chamber of commerce has issued a statement, only about a year or a year and a half ago—I have a copy of it, but I do not think I have it here now—in which, my memory is, he stated the manufacturing industries of San Francisco had diminished; that in 1908 San Francisco had 4,000 manufacturers and in 1913 San Francisco had only 1,400. Most of them have moved to Los Angeles.

Commissioner WEINSTOCK. I happen to have information on that, Mr. Briggs, that I think will be of value in the record.

I was chosen a member of a board of conciliation to represent the employers in a question that arose between the Metal Trades Association and the Iron Trades Council on the matter of hours. That is, the Iron Trades Council wanted an eight-hour day and the employers wanted a nine-hour day. The committee of the employers raised the point that because of the eight-hour day

and because of other union conditions, San Francisco was losing its metal-trade business. The representatives of the Union demanded specific instances to be presented to the conciliation board. The members came at the next meeting with alleged specific cases. On analysis it was found that most of the alleged losses—that is, employers going to other places—were due not to wages and not to hours but to conditions beyond control. For example, some went over to the Oakland and Berkeley side of the bay because they had better shipping facilities and railroad charges were lessened. They could get trackage there that they could not get in crowded San Francisco. In some cases they could get much cheaper land and much larger accommodations than they could in a crowded city like San Francisco. Some had dropped out because of mismanagement; they could not manage their business successfully. It was not possible for the employers to show, to the satisfaction of that conciliation board, one single case where the employer had dropped out of business purely because of unionism.

It was shown that the diminished volume of metal trades in San Francisco was also due to these conditions that had nothing to do with labor: Formerly, San Francisco was the center of the Pacific coast; that is, it produced all the mining machinery. There were very small shops in Seattle and Portland and Los Angeles, and nearly all of that work was centered in San Francisco. To-day Seattle, Portland, and Los Angeles have grown to be great cities, filling their own local requirements, and that business no longer comes to San Francisco, and its sphere of usefulness in industrious lines has been very much minimized—that is, its territory has been minimized. That applies not only to the industry, but to the jobbing business of San Francisco as well. For example, Mr. Scott, the president of the Pacific Hardware Co., the largest hardware company on the Pacific coast, made the public statement some time ago that formerly he had 250 traveling salesmen going out of the city of San Francisco, but the conditions developed so that they had to open a branch in Portland and another branch in Los Angeles, and now he only had one-third that number going out of San Francisco that he formerly had; that their territory had been minimized. That, of course, had nothing to do with labor, because jobbing houses do not deal, as a rule, with organized labor. Therefore the fact of the industrial office of San Francisco having been reduced as it has been is not due, on analysis, to the question of organized labor.

Mr. BRIGGS. I am very glad to hear that statement, because this side of the Rocky Mountains, and at Seattle and Los Angeles, and Portland, at the very time you name, it is not only currently but freely reported that those cities have benefited very, very materially by the fact that a lot of your people in San Francisco pulled out of there on account of labor conditions and went where they could have freedom. I have been told that by many men in all the towns you have named. I do not know that to be the case; that is merely an opinion. I am glad to know what you have stated, because that is not so understood exactly by people on this side of the Rocky Mountains.

Commissioner WEINSTOCK. A question was raised a little while ago about the advantage to the worker of individual bargaining as compared with collective bargaining, and you pointed out that, in your judgment, the worker was better off under a system of individual bargaining than under a system of collective bargaining. Does not that depend upon the law of supply and demand? That is, where two jobs are hunting one man, that one man, under individual bargaining, will do very well; but if two men are hunting one job, will those two men not do better under collective bargaining than under individual bargaining?

Mr. BRIGGS. I want to be fair on that collective proposition. You mean by way of collective to understand the national union to intercede for them?

Commissioner WEINSTOCK. Yes; that is, keeping the minimum from dropping below the living wage.

Mr. BRIGGS. If you will remove the illegal restrictions here, so that when the third party comes to the men involved he comes in a friendly spirit and they feel friendly, I think there are cases where that statement is true. Under present conditions I do not think they could meet that, myself. That is a matter of opinion.

Commissioner WEINSTOCK. Evidently your experience in the matter of organized labor differs seemingly from the experience of Mr. Peabody, who testified before us this morning. That is, I gather from what you said that, in your judgment, the union is simply a burden on the worker; that is, it taxes him for dues and gives him no compensatory benefits. Mr. Peabody this morning made the statement that the chief benefit of trade agreement is that the men are better off. He said that as an employer. He said further that the private

habits and moral conditions and the intellectual developments of miners have very much improved over old conditions, and he gives the labor leaders credit for having educated and raised the standards of the workers. Seemingly the experience in the mining industry is very different from the experience in the metal trades.

Mr. BRIGGS. Quite so.

Commissioner WEINSTOCK. That would not apply to the metal trades?

Mr. BRIGGS. My observation in regard to the way these unions of the American Federation of Labor conduct their business is this—and I have attended many of them to plead on the part of the employer. I am on most friendly terms with a tremendous lot of union men, and I have appeared before those men many times. My observation is, Mr. Weinstock, that 90 per cent of their meetings are held either over or next door to a saloon, and you will find more men in the saloon than you do in the union meeting room of the American Federation of Labor unions. That is my observation. I have seen a tremendous lot of them, and when you go to Chicago, gentlemen, as I understand you are going over there, if you will look up the statistics in Chicago you will find a tremendous lot of these unions hold their meetings in that sort of a place, and it certainly is not the best place for any body of men to gather.

Commissioner WEINSTOCK. Your observations, though, lead you to believe intemperance has increased among union men rather than diminished?

Mr. BRIGGS. Yes, sir; I should give that as my opinion—among the Federation of Labor unions.

Commissioner WEINSTOCK. The miners are also members of the American Federation of Labor, are they not?

Mr. BRIGGS. Certainly they are.

Commissioner WEINSTOCK. Then that branch of the American Federation of Labor, according to the statements of Mr. Mitchell and Mr. Peabody, is undergoing a different process from the metal trades?

Mr. BRIGGS. Quite so; and I would not be surprised if that was brought about a little by that open-shop decision of that great body of men who settled that coal strike.

If I may be permitted a moment about that, you are all familiar with the anthracite coal strike; and I want to say I do not believe there was ever a body of men gotten together that was a more competent body of men to settle an industrial question than the body of men headed by Judge Gray, who handled that case. The employer was represented; the employee was represented by one of the best men there is in the world, Edgar E. Clark, a strong union conductor; Bishop Spalding was there for the clergy; and Carroll D. Wright was there for the public. The employer and the employee were represented. That decision to my mind, was a beautiful decision—ininitely better than you can get from any court, even the Supreme Court of the United States, because of the fact that the Supreme Court can not go into all those conditions. It is impossible to get all those conditions before the court. That commission went down into the mines and spent a week in matters of that sort. Judge Gray put on his overalls and jacket and spent a week down there getting at those conditions. Those are matters you can not present to a court. Then that agreement, that conclusion, was strictly an open-shop proposition, absolutely an open-shop proposition. I know some of those men that went into that agreement. The miners have been better off, according to Mr. Mitchell's own arguments here this morning, by virtue of that agreement.

Commissioner O'CONNELL. Did not that agreement provide for a minimum wage?

Mr. BRIGGS. I think the biggest part of that is piecework, according to his testimony.

Commissioner O'CONNELL. Did not they provide for a minimum wage—the least possible wage to be paid the miners?

Mr. BRIGGS. The agreement would speak better than any recollection of mine.

Commissioner O'CONNELL. Is not that one of the things in here which you say you will not arbitrate or agree to?

Mr. BRIGGS. Wages?

Commissioner O'CONNELL. The minimum wage.

Mr. BRIGGS. We arbitrate wages every time they ask us to do so.

Commissioner O'CONNELL. Do you not say here, in your "Outline of policy," that you include a minimum wage?

Mr. BRIGGS. To what article are you referring?

Commissioner O'CONNELL. In your "Outline of policy?"

Mr. BRIGGS. If you will refer to the article, I will endeavor to answer the question. While you are hunting that up I would like to finish this one thing:

The crisis in our efforts to work under this conciliatory agreement occurred in 1904. Immediately following a year's experience, I think, with the miners, under the decision of the coal-strike commission, which, as you know, was a purely open-shop decision, this occurred. I want to read one clause of that right into this record, if you will allow me to do so. The crisis was reached at that time. We had had 2,500 conferences and could not agree with that union, and we spent all of three weeks trying to get that union to arbitrate with us.

I suggested that there was a beautiful illustration, and I urged that union to join with me, or if they would not join with me I myself would personally secure on behalf of our association either President Roosevelt, Elihu Root, or any other member of the Cabinet; and if we could not get them we would go on down the line of the Supreme Court and the United States Senators until we secured some men who were disinterested to come in and settle this matter for us. There was a question of an eight-hour day involved, but I did not confine myself to working eight hours a day by any means. I worked all day and a good many nights for a good many long weeks. I never worked so hard at anything in my life as I did to get these fellows to adopt that, and they would not do it. What are you going to do when you are running your plants up against that proposition? They will not arbitrate; they will not let a second man come in here.

Commissioner WEINSTOCK. You spoke about the association supporting a member in case of strike. What is meant by "supporting a member?"

Mr. BRIGGS. Help him out of his difficulty.

Commissioner WEINSTOCK. Financially?

Mr. BRIGGS. Yes; we help him. First, we pay a certain portion of the wages of these instructors whom I have defined and described; second, if that method is not adopted, frequently we help him secure his castings at some other shop and pay a portion of the extra expenses incurred thereby; third, while the shop is empty and no man in there we pay an agreed amount for idle floors. Those are the three methods of supports.

Commissioner WEINSTOCK. Sort of a strike insurance, practically?

Mr. BRIGGS. Yes, sir; strike assistance.

Commissioner WEINSTOCK. You also stated that you had a strike because you treated your apprentices too well. Was it that, or was it because you had, in the judgment of the unions, too many apprentices?

Mr. BRIGGS. I only know what the president of that union said to me—a Mr. Anderson. He told me the night before he went out. If you would like to listen to that controversy, I would be delighted to detail it; but I do not want to intrude upon you too much. It illustrates a case that occurred in 150 or 200 other shops at that time.

Commissioner WEINSTOCK. Have the technical schools relieved the situation in any way so far as apprentices are concerned?

Mr. BRIGGS. The tendency is that way, and they will relieve it up to a certain point, but they can not teach the trade in a technical school.

Commissioner WEINSTOCK. They simply shorten the apprentices' period?

Mr. BRIGGS. They will in a way. It is just as Mr. Peabody said on the stand here. He hit the nail right on the head. There are a tremendous lot of working men that do not get to the point of applying a technical education. The technical education applies very pronouncedly to the boy who has ability and ambition and the opportunity to get beyond the ordinary journeyman, but not to the boy who is satisfied with the journeyman's position. To illustrate, take a boy who has been a helper and who has done exceedingly hard work. His ambition, if he is a good bright boy, is to advance; he wants to become a journeyman. That is the goal of his ambition and when he gets there he is satisfied. To that boy a technical education does not appeal very much; and there are lots of those boys. In that respect, the vocational and technical both fall a little short. They do not reach the mark.

Commissioner WEINSTOCK. You pointed out that from your point of view the railroad brotherhoods are the model labor organizations?

Mr. BRIGGS. Yes, sir.

Commissioner WEINSTOCK. If they were all modeled after them, there would be little or no difficulty in employers dealing with organized labor?

Mr. BRIGGS. I believe it.

Commissioner WEINSTOCK. I do not know how correct my information is, but I was informed recently that 95 per cent of the railroad men—that is, the brakemen and conductors and engineers—are in the union?

Mr. BRIGGS. I am talking about four unions, the conductors', the engineers', the railway trainmen, and the firemen. The conductors and railway trainmen are represented by a most distinguished man on your commission here, representing one of the biggest unions in the country. I regret he is not here to-day. I would like to shake hands with him. These conductors and these enginemen are the best paid men in the world. Why not copy their tactics?

Commissioner WEINSTOCK. Evidently they are pretty nearly a closed shop. They have 95 per cent in the union unless my information is in error. Mr. Delano, can you tell us whether that is right or wrong?

Commissioner DELANO. I do not know the exact figure. It is very large. The railroads do not inquire whether a man is in or out.

Commissioner WEINSTOCK. They do exact the minimum wage, to which you object?

Mr. BRIGGS. If you get into the class of people interested in a certain line of work, and they are all alike and their ability is alike, the minimum wage is not objectionable. When you get to the ability and character of the man behind whom you and I are willing to risk our lives on these fast trains, you get a class that are entitled to the same pay. Technically applied, it is the minimum wage. They are picked men, the whole bunch of them.

Commissioner O'CONNELL. Oh, they go up according to their age and employment and seniority.

Mr. BRIGGS. But if they are not competent men and not men of good character and standing, the railroads do not want them. That is one of the provisions of their agreement, that a man must not be drunkard. They will not have him in the union if he is a drunkard. They are working for the best interests of those gentlemen.

Commissioner O'CONNELL. I know; but you say they pick all the men running their fast passenger trains; that they are all picked men. I do not know how many have not gone up according to their seniority, but I will venture to say 95 per cent of them are men who have gone right up. They are not picked especially for that work.

Mr. BRIGGS. When were they picked? When did they go to work for the road?

Commissioner O'CONNELL. It is based upon that time, and upon seniority.

Mr. BRIGGS. But they are picked when they are hired by the road. If one of those men back at that time, when he starts in for that road, is not the right kind of a man he can not get in in the first place. He can not get into the Brotherhood of Locomotive Engineers and Enginemen and Firemen. I know a tremendous lot of those men personally and have discussed this question with them, and am advised by them, by men whom I believe tell the truth every time, that anywhere along the line that they enter that union, if they become dissolute and do not attend to business and are not on time when they ought to be the union fires them. I know those men that have said that, but, of course, I could give no names.

Commissioner O'CONNELL. If they fired all the men on a railroad not on time we would not have any railroads to-day.

Mr. BRIGGS. What I mean by saying "on time" is that when a train is scheduled to leave at 6.45, that man is there at 6.45. I am not talking about his arrival; I am talking about his start. The conductors and enginemen are on the job to a greater degree than any other bunch of men in the world. I make that statement unqualifiedly, and I can prove it to you if it is necessary.

Commissioner O'CONNELL. Nobody questions that.

Commissioner WEINSTOCK. I can see now why you object to a minimum wage. You do object to paying a minimum wage to men who are not worth a minimum wage?

Mr. BRIGGS. That is the point, exactly.

Commissioner WEINSTOCK. Under your New York agreement did the employer reserve the right to discharge an employee any time that he pleased, or was he restricted in that? I am not speaking of the nonunion man, but the union man.

Mr. BRIGGS. We could not reserve any rights about anything there.

Commissioner WEINSTOCK. You had to take whatever men they furnished you, regardless of their merit? You had no voice in the selection of the men?

Mr. BRIGGS. We had a voice to this extent: If there was the least disagreement occurred between a member of the foundry association and a molder which those two men could not settle, then the National Founders' Association and the iron molders' union would come in and attempt to settle it. We had no way to settle that. We could sit around a table and discuss it. I have been

around the world several times discussing those questions. We would discuss the question here, and then in Baltimore, and then in New York, and then in Philadelphia, and it would be the same thing right over and over again. We could not settle anything.

Commissioner WEINSTOCK. If you employed a union man and found he was unfit, did you not have the right to discharge him?

Mr. BRIGGS. We claimed to have the right, but if we did discharge him our shops were struck. That is my point, exactly.

Commissioner WEINSTOCK. So you were forced to keep incompetent men and pay them the minimum wage?

Mr. BRIGGS. Yes; the union dictated the running of the shop under those union conditions. If I had time, I would like to detail a lot of those things.

Commissioner O'CONNELL. I notice in this "Outline of policy," or constitution and by-laws, several headings here—limitation of output, limitation of a man's earning capacity, fines and restrictions, methods of employment, freedom of employment, relation of employee, apprentices, apprentices again, strikes and lockouts, arbitration, method of arbitration, and down here we come to wages—all of these several headings here, of which you assume your association itself to be the absolute judge and which they say they will not arbitrate and will not submit to arbitration with the employee. All other things, apparently, you are willing to submit to arbitration. What is there left to be submitted to arbitration after those?

Mr. BRIGGS. About 95 per cent of all that exists in relations of employer and employee is wages and hours. Every honest man in this world is looking for pay day. It is the amount of money he gets in his envelope that interests him; that is what supports his family; that is what he is working for; that is what you and I are working for. We are ready to arbitrate that every time. But whether I have a right to employ my own boy in my shop is a question I do not think any man ought to ask me to arbitrate. I believe the Constitution of the Federal Government and of every State in which we live guarantees me that right. I can cite case after case where proprietors have absolutely been refused the opportunity of putting their own men in their own shops.

Commissioner O'CONNELL. Can you cite me one State—about the State protecting the apprentice?

Mr. BRIGGS. I will. Take Indiana, Massachusetts, and Alabama. If the commission would like an abstract of that, I would be very glad indeed to produce it.

Commissioner O'CONNELL. Providing for the protection of apprentices and the number of apprentices employed?

Mr. BRIGGS. Not the number, but the manner in which the apprenticeship shall be conducted, defined specifically.

Commissioner O'CONNELL. Speaking of the number of apprentices, you say that, in your opinion, somebody shook dice for it?

Mr. BRIGGS. That is what I have been told. I did not give that as my opinion. I am quoting somebody.

Commissioner O'CONNELL. Would you mind telling us who that was?

Mr. BRIGGS. Mr. Valentine told me once, and Mr. Keough told me again, and John Campbell told me. Three members of the Stove Founders' Defense told me that.

Commissioner O'CONNELL. Has the founders' association, either itself or in conjunction with any other association, maintained and established an employment agency in a town where all employees of their factories must go to seek employment?

Mr. BRIGGS. No, sir.

Commissioner O'CONNELL. Have they at any time?

Mr. BRIGGS. No, sir; they never did.

Commissioner O'CONNELL. You spoke about the federation organizations. I suppose when you mentioned the federation organizations you meant organizations that are affiliated to the federation and not the federation?

Mr. BRIGGS. I mean those constituent organizations which compose the American Federation of Labor, which, I understand, amount to 119.

Commissioner O'CONNELL. You spoke of the unlawful things that they do—if they would live within the law—and apparently conveyed the idea that they are doing something unlawful. Have you any particular thing in mind that you class in that category of unlawful things?

Mr. BRIGGS. It is an unlawful thing for a union to come and compel me to discharge a man because he has not paid his dues. It is an unlawful thing for

a man to compel me to discharge an apprentice because I have got more than the union ratio.

Commissioner O'CONNELL. Where is there any such law as that?

Mr. BRIGGS. I am talking about your American Federation of Labor that says that. You ask—if I understand correctly; and if not, I beg your pardon—to state cases where they insisted upon things that were unlawful. My answer is that it is unlawful for the American Federation of Labor to demand of me the discharge of any man—

Commissioner O'CONNELL. Who makes it unlawful? Where is the law that says it is unlawful to do such a thing?

Mr. BRIGGS. The Federal Constitution of the United States says so. It guarantees to you and to me that we can employ anybody we please. It has been decided time and time again, and, if this commission would like to have me do so, I shall be very glad to furnish them with a number of cases where the question of the closed shop has been decided to be strictly unlawful. I should be glad to furnish you a number of them, if you would like to have them.

Commissioner O'CONNELL. Yes.

Mr. BRIGGS. Understand, gentlemen, that we are here in the greatest spirit of friendship to this commission. We have been invited here, and we have come here in that spirit and the records of this association are an open book from start to finish. Whatever you want is yours.

There is one point here which I want to touch upon—or two points—before we adjourn, if I am not to be permitted to testify hereafter.

When I came here, the invitation which was extended to me stated that the iron molders' union would go on first, and at the outset was just a trifle discontinued because I was put on first. I expected that I would have an opportunity, probably, to confine myself more directly to some of these issues. In that respect I apologize, because I have wobbled and wandered from subject to subject. If I am not unjust and unfair about the matter I would like an opportunity for our association to be represented here at some later date. I do not ask to have that hearing immediately after the iron molders' union has testified, or anything like that, but I do feel that this great, big body of men—there are some 550 in this association, and they employ at least 450,000 men, and we have 32,000 molders involved, and for every molder in the country there are from 10 to 15 men dependent upon getting that casting, machinists, pattern makers, and men of that sort, and they employ at least 450,000 men—I do feel that we have had considerable valuable experience, and that we would like to dish it up to you if you would like to hear it.

Commissioner O'CONNELL. I do not think there is any question but what the commission would be glad to hear from your association later, at any time. I think there is no question about that.

You were speaking about the very small percentage of organized people, or the people represented, as against the great mass of unorganized people; in other words, the smallness of the right of the organized people to speak. I note from your own statement here that there are, you say, about 550 shops represented in your association out of a possible 6,000. I suppose the 6,000 are somewhat represented in the expression of your association—the things you speak for—as probably the nonunion men would be represented in the same way by the union men. What is the difference in percentage, to the totals, as to the right of one to speak for the other? Is there a great discrepancy, as compared with the total in your association, for the number that your association represents, the same as the discrepancy to which you refer concerning the number that the other side represents?

Mr. BRIGGS. I am not entirely sure as to what the other side represents. I would hardly be competent to answer that question directly. It would be a mere matter of opinion, you know.

Commissioner O'CONNELL. I do not want to carry that question any further. I just wanted to bring it out in the record. I will look it up later myself. You said something that interested me very much when you spoke about overtraining your apprentices. If there is anything that I take great pleasure in, and have taken great pleasure in, during my experience of many, many years, it is in looking out for the apprentice boys, to see that they get some protection, and that the contracts provide for it. I am intensely interested in the method you must have adopted to overtrain your apprentices.

Mr. BRIGGS. Nothing would please me so much in this world as to have the attention of this commission for about an hour and a half to detail that whole

proposition to you and to submit it to you, and to submit to you what I believe to be the ideal contract. It would give me a great deal of pleasure to do that.

Commissioner O'CONNELL. Following that you said a strike resulted—as a result of that overtraining?

Mr. BRIGGS. Yes.

Commissioner O'CONNELL. That was in 1901, when the machinists' strike took place?

Mr. BRIGGS. Yes.

Commissioner O'CONNELL. Do you mean to convey the idea that the machinists' strike was the result of overtraining apprentices?

Mr. BRIGGS. That is the only excuse they gave me for striking in my shop. I would love to detail that, too, before this commission.

Commissioner O'CONNELL. No; it is not necessary at this time.

That is all.

Mr. BRIGGS. There are two points here that I do want to touch upon before you adjourn. I do not want to intrude on the commission, but I do want to say a few words on the question of hours.

There was a time in this country when workmen were working long hours. There is no question about that; everybody admits that. There was a time when men worked 12 hours and 14 hours a day, and 16 hours a day, and all that sort of thing. That was wrong; that was absolutely wrong. But be it said to the credit of the foundrymen, whom I represent at this time, that they were among the very first to reduce the number of hours, and I believe that the hours now are down to a consistent point.

Judged by the conversation around this table and the conversation which you hear upon this subject, there seems to be a disposition on behalf of the American Federation of Labor to recommend, and, in certain cases, to insist upon a certain schedule of hours for all trades and all industries. Just now the number of hours which we hear of mostly is eight hours.

My observation is, and I think I have had a considerable opportunity to observe both sides of this question, as I have spent about half of my life as an employer and about half as an employee. I have worked on both sides. It has been my business since I was 17 years old to deal with labor, individually and collectively, all the way from three or four men to very large quantities. Therefore I say that I have seen both sides of this question, and I want to say this, that I think it is a great injustice for the American Federation of Labor or any other organized body to insist upon any uniform schedule of hours as applying to all trades and industries.

For example, examine any of our big factories which you and I have had to do with, and you will find quite a large number of classes of trade. You go into the office and you find bookkeepers and draftsmen, who are working in a stooped position and working with their eyes very intently all day. You go into the machine shop and you find men working at a lathe, all of the laborious work of which is done by power. Even the old-fashioned way of running a crane to get a shaft into a lathe is done away with by pneumatic power and electric power.

That is all done for him, and it is the best thing in the world that could happen. He stands at his lathe, and he watches the operation of that tool, he sees that the tool which the tool-shop man supplies him is properly adjusted and that it is doing its work properly, and that constitutes his day's work.

Now, my point: Ten hours' work on that machine is not so enervating, does not require so much sacrifice of energy and health as eight hours in the drafting room. I have taken those two extremes for purposes of illustration. I do think that there should be a differentiation here; that it should be considered by classes. Take the cases of the men in the mines, whom we have been hearing about to-day. The man who works in one of those mines, improperly ventilated, without sufficient fresh air, without light, works in a condition where it is infinitely worse for him to work 8 hours than it is for the machinist I have described to work 10 hours. I do think that there ought to be a differentiation there.

One word more and I am through.

Commissioner WEINSTOCK. What are the hours at present in the metal trades?

Mr. BRIGGS. They run, for the different classes, from 8 to 10 hours.

Commissioner WEINSTOCK. What is the average?

Mr. BRIGGS. This is merely my opinion. It is difficult for me to state off-hand. I think there are some Government statistics on this that would be very much more reliable than any statement that I might make.

Commissioner WEINSTOCK. I thought perhaps you had the information at hand.

Mr. BRIGGS. I have not got it at my tongue's end. I am sorry to say that I have not. I think it is around nine hours.

There is just one more point, gentlemen, that I want to make here before I stop talking, and that is: I want to bring before this commission the fact that you are considering the conditions, the well-being, the uplifting, if you please, of at least 90 nonunion men when you are considering 7 union men. I think that should be taken into consideration.

Commissioner O'CONNELL. This commission is considering the welfare and the uplifting of all the people—not union or nonunion men.

Mr. BRIGGS. Accepted. And do not forget that; do not forget that responsibility.

Commissioner O'CONNELL. This commission is not provided for union or for nonunion purposes.

Mr. BRIGGS. I am glad to hear that statement; I am exceeding glad to hear that statement. I hope that will prevail.

Commissioner O'CONNELL. Did you come here with the idea or the understanding that this commission was appointed on the question of union or nonunion—

Mr. BRIGGS. I did not come here with that understanding, but the character of the discussion has been such, and the discussion has gone to such an extent that I really thought perhaps that entered into your deliberations. However, if I have misunderstood, I apologize heartily.

Commissioner O'CONNELL. I do not want you to apologize to me, I am sure; but I think your peculiar way of expressing yourself has led us, or at least has led me, to believe that you were here on the "anti" side of the proposition.

The ACTING CHAIRMAN. Is that all, Mr. Briggs?

Mr. BRIGGS. It is all, barring this: That I would love to have an opportunity to be permitted to come before this commission at some future time, at your convenience, and at any time and place you may name, provided our association would like to appear before you.

The ACTING CHAIRMAN. The commission will now adjourn until to-morrow at 10 o'clock, when we will hear Mr. Valentine.

(Whereupon an adjournment was taken until to-morrow, Tuesday, April 7, 1914, at 10 o'clock a. m.)

WASHINGTON, D. C., *Tuesday, April 7, 1914.*

The commission met at 10 o'clock a. m. in the assembly room of the Shoreham Hotel.

Present: Commissioners John R. Commons (acting chairman), Mrs. J. Borden Harriman, Frederick A. Delano, Harris Weinstock, S. Thruston Ballard, John B. Lennon, and James O'Connell.

Present also for the commission: Mr. W. O. Thompson, counsel; Mr. W. Jett Lauck, managing expert; Mr. George E. Barnett, special investigator; Mr. B. M. Manly, superintendent Division of Industrial Investigations; and Mr. F. H. Bird, superintendent Division of Public Agencies.

The ACTING CHAIRMAN. Mr. Barnett will conduct the interviewing this morning. Whom will you call for your first witness, Mr. Barnett?

Mr. BARNETT. I will call Mr. Valentine.

TESTIMONY OF MR. JOSEPH F. VALENTINE.

Mr. BARNETT. Mr. Valentine, will you state your name, address, and position?

Mr. VALENTINE. Joseph F. Valentine; president International Molders' Union; Cincinnati, Ohio.

Mr. BARNETT. How long have you been president of the molders' union?

Mr. VALENTINE. Since 1904, I think; vice president since 1890.

Mr. BARNETT. So you have been acquainted with the history of the New York agreement of 1899?

Mr. VALENTINE. Very well.

Mr. BARNETT. You were at that time an official of the International Molders' Union?

Mr. VALENTINE. I was first vice president at that time.

Mr. BARNETT. Will you tell the commission, Mr. Valentine, the essential difference in the character of the agreement with the National Founders' Association, and the agreement with the Stove Founders' National Defense Association?

Mr. VALENTINE. You want to know the essential difference?

Mr. BARNETT. In the form of the agreement; yes.

Mr. VALENTINE. In the agreement which we have with the Stove Founders' National Defense Association we adopted different tactics entirely in approaching the questions which have caused a disagreement between the representatives of the National Founders' Association and the Iron Molders' International Union.

In 1890 there were representatives of the stove manufacturers and representatives of the molders' union got together for the purpose of formulating an agreement. A discussion on the various matters affecting the interests of each was had; I suppose there were three or four days occupied in that way. At that conference we adopted that agreement, or an agreement which we call a conference agreement, under which it was provided that in case of dispute in a shop we would approach each other with a view of conciliating the differences between us; and with that, we adjourned for that year.

The next year we met again, and during the interim both sides, of course, had had something to say. The next year we approached questions that had arisen during that year, and we then made another conference agreement covering the different points that had arisen.

We have met continuously; I think I am safe in saying we have held about 20 meetings in the 24 years we have had an agreement with that association. There have been differences of opinion, but both sides have, in adjourning the conferences, agreed to take the matters under consideration, and the following year we usually got to an agreement on some of the points. In some instances, of course, we did not accomplish that. But, to show the policy of the two associations in approaching these questions, we have gotten along for 24 years under that agreement without a strike in a stove shop.

There have been as great differences between us as there would be between the National Founders' Association and the representatives of the molders' union. The only trouble with the National Founders' Association is that they had a sort of "outline of policy" that they wanted to cram down everybody's throat forthwith, without any discussion whatever. That is the difference between the two. I have a list here of conference agreements that have been adopted from time to time between the representatives of the Stove Founders' National Defense Association and the molders' union. They are here, and can be made a part of the record.

Mr. BARNETT. We would be glad to have that.

(The list of conference agreements referred to by the witness was filed with the commission by Mr. Valentine, marked "Valentine Exhibit No. 1.")

(Valentine Exhibit No. 1, "Conference Agreements in force and ruling between the International Molders' Union of N. A., and The Stove Founders' N. D. A., January 1, 1913," was submitted in printed form.)

Commissioner WEINSTOCK. What is the name of that defense association which you mentioned?

Mr. VALENTINE. The Stove Founders' National Defense Association.

Commissioner WEINSTOCK. What does that cover?

Mr. VALENTINE. That covers the stove and heater industry exclusively.

Commissioner WEINSTOCK. What is the other association?

Mr. VALENTINE. The National Founders' Association.

Commissioner WEINSTOCK. That is a different association?

Mr. VALENTINE. A different association entirely.

Mr. BARNETT. Was the original agreement with the National Founders' Association identical with that of the Stove Founders' National Defense Association? Was it identical, or substantially so?

Mr. VALENTINE. Yes. I might say substantially so. That is the old agreement.

Mr. BARNETT. The New York agreement was in 1890, was it not?

Mr. VALENTINE. No; 1899.

Mr. BARNETT. I mean the Stove Founders' National Defense Association agreement.

Mr. VALENTINE. 1890, yes.

Mr. BARNETT. Was there any substantial change made in the agreement in 1891 with reference to the settling of wage rates?

Mr. VALENTINE. No; just simply the question of—

Mr. BARNETT (interposing). Suppose I put it this way: At the present time how are wage rates fixed between the Stove Founders' National Defense Association and the molders' union?

Mr. VALENTINE. It is almost piecework under the Stove Founders' National Defense Association agreement, and we have what is known as a board price; that is, the base price. From year to year we discuss the advisability of adding percentages to that base rate, or taking from it, in the shape of a 10 per cent advance or a 5 per cent advance, or vice versa.

Mr. BARNETT. So every piece rate in the United States in the union stove shops is fixed practically at the annual conference?

Mr. VALENTINE. The percentages are fixed.

Mr. BARNETT. The percentage is fixed?

Mr. VALENTINE. Yes.

Mr. BARNETT. Was any such arrangement for the fixing of the national rate made with the founders' association?

Mr. VALENTINE. No; not at that time. The New York agreement was patterned much after the agreement with the stove men, and it was thought the we could eventually reach the same decision as we had with the defense people.

Mr. BARNETT. That is, as to the national rate?

Mr. VALENTINE. Yes.

Mr. BARNETT. And you reached that with the derense people in 1891?

Mr. VALENTINE. We did not reach it in that way. The first percentage that we asked for was in 1898. We went along with the question of taking up grievances that arose in the shop, and then in 1898 we succeeded in getting an advance of 10 per cent, and it applied all over the country to all members of the association, and the independent manufacturers granted the same rate, too. Since that time we have obtained an additional 20 per cent advance, or 25 per cent, I believe it is.

Mr. BARNETT. The conference had power, from 1891 on, to make such an advance, did it not? This annual conference, from 1891 on, had power to fix the national rate of wage?

Mr. VALENTINE. There is a conference committee. Both sides are represented by six men, or five men, as the case may be, and that total number of men comprising that committee have the right to fix rates of wages for the country.

Mr. BARNETT. Are those rates substantially identical throughout the United States, or do they differ in different parts of the country?

Mr. VALENTINE. They are practically identical; that is, they may differ in percentages, but the base rate, when that is taken into consideration, is the same. For instance, in the stove shops of Detroit we have what might be termed an even dollar. That is the base rate. The percentage in summer, in Detroit, is this: If a man ears a dollar, he gets a 70-cent bonus. In Cleveland or in Cincinnati, we have the dollar base rate, but the man only get a 35-cent bonus. The reason for that is that the base rate is lower in one place than in another.

Mr. BARNETT. But the real rate of wages is the same?

Mr. VALENTINE. Just about the same.

Mr. BARNETT. Is there any difference between the Pacific-coast rate and that in the East?

Mr. VALENTINE. Not any in the rate. We have the 35 per cent, and they are just about the same as we have through the East.

Mr. BARNETT. But is that a basic rate? Was that equalized with the basic rate? Is that practically equal with the basic rate in the East?

Mr. VALENTINE. Just about the same.

Mr. BARNETT. So, that there is, through the United States as a whole, a substantially identical rate for stove molders?

Mr. VALENTINE. About so; yes.

Mr. BARNETT. And that kind of an arrangement was never worked out with the National Founders' Association?

Mr. VALENTINE. No.

Mr. BARNETT. Was there any attempt to work out a national rate—any discussion of it?

Mr. VALENTINE. Yes; it has been discussed time and again, but the representatives of the National Founders' Association take a positive position on some questions which are involved; for instance, the making of castings by machines. The association's position on that question was this: That the ma-

chine was the product of the machine shop, and they would not discuss with the representatives of the molders' union any price on those castings. They wanted to be free to operate the machines with whomsoever they pleased. With the other association that is one of the points of contention, and we have happily settled the question and priced the work on the machines.

Another point involved was the apprentice question. The National Founders' Association's position on that question is that they have the right, should have the right, to employ as many apprentices as they see fit. With the other association the question was under discussion for a number of years. It might have been 5 or 6 or 7 or 10 years, probably; and after 10 years' discussion on the part of both, we have succeeded in agreeing to a ratio of 1 for the shop and 1 for every 5 journeymen employed thereafter; and we make mechanics out of the boys. With the other associations they want to employ whomsoever they please, and they employ the stoutest kind of a man, and in many instances he can not say yes or no in English; and they use him as a machine; they do not teach him the trade at all, but just make him a little better than the ordinary laborer. That is our difference.

Mr. BARNETT. Do you think that there would be a technical difficulty in settling a national rate of wages for the National Founders' Association? You have discussed this in many of your conferences, as to the possibility of settling it?

Mr. VALENTINE. There would, at this time.

Mr. BARNETT. I mean, would there have been at the outset, when these conferences were held? What was the particular reason which prevented it being fixed—a national wage?

Mr. VALENTINE. For the reason that I have just explained; there were a good many points involved that the association felt they could not discuss with us at all. The outline of policy shows it.

Mr. BARNETT. I did not mean with reference to the apprentices, but I mean simply with reference to the rate of wages.

Mr. VALENTINE. Well, their refusal to recognize the right of the molders to establish a minimum rate; that is one point.

Mr. BARNETT. Will you explain what that point was? What is the policy of the molders' union with reference to a minimum rate?

Mr. VALENTINE. We established the minimum, and we think that minimum ought to be from 1 cent up. There must be a minimum. The principle of the minimum we believe in. The other side do not.

Mr. BARNETT. Did they offer any substitute for the minimum rate?

Mr. VALENTINE. Not that I know of.

Mr. BARNETT. So, then, you regard the breaking down of that agreement with the National Molders' Association as primarily due to the differences of opinion on the question of apprentices and the question of the operation of machines, and not to the form of the agreement?

Mr. VALENTINE. Well, I consider the question from this point: I do not know that that was the trouble. What really caused the abrogation of the New York agreement—we have never been advised as to why they abrogated the agreement—all we know is this, that we received word that the agreement had been abrogated. We have not been asked for any conference to consider the question of abrogating the New York agreement. The convention of the association simply abrogated it, and notified us to that effect. That was after a difference of opinion that arose in Utica, N. Y.

Our contention is that the New York agreement provides that neither side shall attempt to put into effect its desires or demands until a conference has been called to consider these desires or the demands.

In this instance the employers in Utica asked for a reduction of 15 per cent in molding prices. We refused to grant it. Then we felt it was the duty of the members of this association to appeal to their association and ask for a conference to discuss the matter; and, in the meantime, the question would remain in statu quo. The conference would determine as to whether there should be a reduction or not. The opinion of the association was this, as I understand it—that instead of doing that, so the employers tell us in Utica, that they were advised to put the reduction into effect forthwith, and then it would be our grievance. They did so, and our men left their shop because they did that.

The question was taken up time and again with a view of trying to reach an agreement, but we felt that our position was right, that they would have to reinstate the men in their former positions and give them the same wages

until this conference was held, for the reason that had we agreed to that change in the New York agreement it would have been injurious to both sides. Our men may have demanded an advance of a dollar a day or two dollars a day, and if the policy was a good one all our men would have to do would be to say, "We want \$2 a day advance," and the foundry men would have to concede it pending the conference. We felt that that was a wrong position. If our men made a demand, then the conference would determine whether they would be entitled to that advance or not. That, in itself, has really caused the parting of the ways between the two associations. That is the main point.

Subsequently, while the strike was on, we had the question in conference as to whose position was correct, and the officers of the association agreed with the officers of the molders' union that the position of the molders' union was correct; and that is in writing.

Mr. BARNETT. What was the difference between the National Founders' Association and the molders' union with reference to the machines?

Mr. VALENTINE. Our position is that if any improvement is brought into the shop to make castings, we recognize it and we want to improve upon the improvement if we can. We want our men to operate these molding machines under a day's rate, or a piece rate, whatever it might be. The position of the association is, as I stated before, that it is the product of the machine shop and we have no right to discuss it with them. It simplifies and takes away some of the skill, and it may deprive a number of our men of employment; but they would not discuss that with us at all.

Mr. BARNETT. Have you a national rule, a molders' union rule, with reference to the introduction of molding machines?

Mr. VALENTINE. Only except this, sir. We say, "This piece, the price of it is 10 cents, made under a certain condition." A machine is brought in to make that with, and we say to the employer, "That is 10 cents, the base price is that." "That machine enables the molders to make two where they formerly made one." Our position, then, is that it is 5 cents; that is our position, that it is only worth 5 cents; that is all.

Mr. BARNETT. That would mean, then, that the day rate or the remuneration for the molders should be maintained on the machine?

Mr. VALENTINE. Yes; if we made 100 by hand and 200 by machine I think we ought to get the same rate that we get by hand, because the employer gets a great big output.

Mr. BARNETT. Have you the constitution of the molders' union with you?

Mr. VALENTINE. Yes.

Mr. BARNETT. Can you read that clause to us?

Mr. VALENTINE. I don't believe I have one with me.

Mr. BARNETT. Will you file a marked copy with us?

Mr. VALENTINE. Yes.

Mr. BARNETT. What agreement have you reached with the Stove Founders' National Defense Association? You spoke of reaching an agreement with them as to the introduction of molding machines. What is the substance of that agreement?

Mr. VALENTINE. We have not really reached a definite agreement with the association, but at our last meeting at Atlantic City last December we discussed the question. I think we had discussed it for at least 10 years, and we have not reached any agreement. At the Atlantic City meeting we came very near to an agreement, so much so that both sides, both conferees, said this: "You think the molders can do this and that; appoint a committee of molders and let them go into our shops and see what you mean by your promises, etc., and then we will consider it."

Recently, within the last two weeks, we have reached an agreement with the stove foundry men of Taunton, Mass., covering probably a thousand pieces on the molding machine. We have gone into it, and we have succeeded in 12 shops in settling that question, and the next time we meet the representatives of the defense association, as we call it, we will come to an agreement, and it has taken us 10 years to do it.

Mr. BARNETT. In the meantime how have these machines, the operation of these machines been regulated, under what rules? Have the stove molders been using machines during those 10 years?

Mr. VALENTINE. Yes; the journeymen or the apprentices have been using them.

Mr. BARNETT. No handy men have been put on the machines in the stove-foundry shops, on the stove-molding machines?

Mr. VALENTINE. No.

Mr. BARNETT. Does the association desire to employ handy men?

Mr. VALENTINE. No; we have an agreement with the association that journeymen molders and apprentices shall be employed on the machines.

Mr. BARNETT. What is the character of the change that the defense association desires in the rules with reference to machines? You say the matter has been under discussion for 10 years; what kind of an agreement does this association desire?

Mr. VALENTINE. The question is as to output; that is all that is involved.

Mr. BARNETT. As to output?

Mr. VALENTINE. Output; that is all there is to it.

Mr. BARNETT. What is the contention of the association with reference to the output of the machines at the present time?

Mr. VALENTINE. Well, naturally the owner of the shop feels that the skilled man will not do justice to it, that a man less skilled, who has never had the experience or any opportunity to use skill, will do a greater output than the other man. That is the point of difference, but we have happily got over that.

Mr. BARNETT. How do they propose to remedy that in that agreement?

Mr. VALENTINE. Well, we have not reached the point yet where we can have an agreement on it, only locally. We just took, as I stated before, the basis, this piece being 10 cents, and we find that a man by the use of this machine could double the output; we have simply cut the piece price down one-half. Now, I want to say this for your benefit.

Mr. BARNETT. Yes.

Mr. VALENTINE. Machines in a foundry are not like machines in a machine shop. As a rule, machines in a foundry add to the burden of a man; it does not relieve him of hard work at all but it adds to his work. It eliminates some of the skill but it adds to his labor. Ordinarily he may have 100 shovels of sand to shovel in the mold, and he may have to shovel in 200 shovels of sand into a machine mold. It adds to his burden, it does not relieve him of any of the hard work at all.

Mr. BARNETT. Is there any difficulty in getting molders to go on the machines?

Mr. VALENTINE. There has been, and I think there are some molders now who hesitate to go onto molding machines if they can get other employment.

Mr. BARNETT. In the agreement with the Stove Founders' National Defense Association let us assume—as has been the case, I assume, in the history of the agreement—that there is a national rule of the union relating to conditions of employment, as, for example, an apprenticeship rule, and I suppose no agreement has been reached in the conference. Under those circumstances, what rule is applied in the shops of the members? Is the rule of the national union enforced?

Mr. VALENTINE. Yes; it was enforced in many instances.

Mr. BARNETT. Let me put it more concretely: Suppose at this convention of the molders' union the shop rule—that is, the rule regulating the use of molding machines—should be passed by the convention and should go through to the referendum, would that rule be enforced upon the members of the defense association in advance of its acceptance by the conference?

Mr. VALENTINE. We consider that an agreement reached with the Stove Founders' National Defense Association is above any decision that we might reach in the convention.

Mr. BARNETT. Above any rule reached in the convention?

Mr. VALENTINE. Yes; in fact our constitution says that the conference agreement takes precedence.

Mr. BARNETT. When was that clause put into the constitution?

Mr. VALENTINE. Years ago.

Mr. BARNETT. At the beginning of the conference?

Mr. VALENTINE. No; perhaps in 1895—somewhere along there or a few years afterwards.

Mr. BARNETT. Suppose the matter is one that has never been settled in conference agreement—about which there is no clause in the conference agreements—then the rule of the national union would not apply?

Mr. VALENTINE. No, sir.

Mr. BARNETT. It would not?

Mr. VALENTINE. No.

Mr. BARNETT. What was the difficulty between the defense association and the molders with reference to apprenticeships? You say there was a long discussion.

Mr. VALENTINE. I guess 10 years or more.

Mr. BARNETT. How was that worked out; what was the rule of the national union? Suppose we start out that way.

Mr. VALENTINE. In some places we had an apprentice ratio of 1 for the shop and 1 for every 8 journeymen employed, and in other shops there was only 1 apprentice to every 2 journeymen employed or maybe 3. We saw that condition, and we concluded that we ought to have some agreement upon it, so that we would have it uniform; but it took us 10 or 12 years to agree upon a ratio of 1 for the shop and 1 for every 5 journeymen. We submitted it to our membership, and the membership did not take kindly to it the first time, the second time, or, perhaps, the third time, but after a while they gave in; they agreed to it, and it is now one of the conference agreements that can not be changed. None of these conference agreements can be changed except by and with the consent of both parties to the agreement.

Mr. BARNETT. So that the conference agreement is the constitution?

Mr. VALENTINE. Yes.

Mr. BARNETT. Of the trade?

Mr. VALENTINE. Yes.

Mr. BARNETT. While this apprenticeship agreement was under consideration, I understand you, there was no national rule at that time?

Mr. VALENTINE. No, sir.

Mr. BARNETT. There was no rule of the national union?

Mr. VALENTINE. No, sir.

Mr. BARNETT. Now, during this period, were these local apprenticeship rules in force in the shops of the stove founders?

Mr. VALENTINE. Yes.

Mr. BARNETT. So that the local rule, then, would be enforced if there is no conference agreement on that point?

Mr. VALENTINE. No, sir—that is, you mean to say that the local unions make some changes in the rules?

Mr. BARNETT. No; I mean a point on which there is no clause in the conference agreement. At that time there was no clause in the conference agreement relating to apprenticeships—the ratio had not been fixed by the conference?

Mr. VALENTINE. No, sir.

Mr. BARNETT. As I understand you, a local union as, for example, the New York Molders' Union, if it had apprenticeship ratio, that ratio was in force in the shops of the stove founders—is that right?

Mr. VALENTINE. Yes; up to the time of the agreement.

Mr. BARNETT. So that if—at the present time—a local union had made a shop rule of any kind that would be enforced on the stove founders if there was no clause in the conference agreement regulating that matter?

Mr. VALENTINE. I do not quite grasp that.

Mr. BARNETT. Did you ever have any trouble with the local union rules on this agreement?

Mr. VALENTINE. A local union, it may desire to make some changes in the conditions in the shop, and so forth. It makes this demand, we will say; then it comes up to the national union, and the national union simply gives a decision that this matter shall rest until the next conference, and when the next conference takes place between the two associations, then we thrash that out and come to an agreement upon it.

Of course there may be differences arise between the molders as to the interpretation of some of the conference agreements, and that being so, there is a representative of the two associations that visits the locality where the disagreement exists and takes them up for adjustment, and those two officers have the authority to adjust it.

Mr. BARNETT. Is there any appeal from their decision?

Mr. VALENTINE. Except what is known as the conference committee, consisting of three manufacturers and three representatives of the union; we have never had to appeal to that court but once, and when we did appeal the conference agreed that the employer was wrong.

Mr. BARNETT. Have you any provision for arbitration in case the conference committee can not reach an agreement?

Mr. VALENTINE. No; we have simply an even number, conciliation.

Mr. BARNETT. Do you find that to work satisfactorily?

Mr. VALENTINE. Very.

Mr. BARNETT. You do not think it necessary to provide any such agreement for arbitration, as Mr. Mitchell thinks—did you hear Mr. Mitchell's testimony?

Mr. VALENTINE. Yes. I will say in addition to that that I do not believe that a doctor or a lawyer or somebody else could settle our troubles in this foundry. It usually arises that there is a little difference in this pattern from the other. We know the two representatives of the association can agree upon that. They may not agree this year, but they will next. If there is a difference in the piece, there may be a difference in price. We have this piece, 10 cents. A new pattern comes in, and we take this as a basis and put a price on that; there may be a difference of 2 cents. After we get into conference and reach a decision, if the molder wins the decision the employer gives him the money on his next pay day. If we lose out, we have to pay it to the other fellow; the molder never loses anything; he works right along.

Mr. BARNETT. How does that start at the bottom in any factory? Suppose a new stove comes in, who makes the first prices?

Mr. VALENTINE. The committee in our shop and the foreman of the shop.

Mr. BARNETT. And if they disagree?

Mr. VALENTINE. Then it is referred to the two associations.

Mr. BARNETT. Mr. Hogan and Mr. Kehoe?

Mr. VALENTINE. Some of us; there are six or seven of us.

Mr. BARNETT. How much time does that take, Mr. Valentine?

Mr. VALENTINE. I don't know; I have known some instances where it took three or four months to settle the price.

Mr. BARNETT. No; I mean the number of cases going up to the secretary of the defense association?

Mr. VALENTINE. I could not say just how many.

Mr. BARNETT. Does it take a great deal of time?

Mr. VALENTINE. In some cases it does not take a great deal of trouble and does not take much time; it depends upon the employer and the molder. When you get two men together and both of them very pugnacious, and they do not agree regularly, we have to give them time to cool off, and eventually they cool off and we get down to facts. We have not had any strikes in the shops in 24 years, so it shows that everything has been handled pretty well.

Mr. BARNETT. In reference to the attitude of the molders' union and the National Founders' Defense Association since 1904—since the break in 1904—what part of the shops in the National Founders' Defense Association were union shops—open or union members?

Mr. VALENTINE. I could not say.

Mr. BARNETT. Has the molders' union had much trouble in shops of the National Founders' Defense Association since 1904?

Mr. VALENTINE. In some; yes.

Mr. BARNETT. In some?

Mr. VALENTINE. Yes; we to-day have verbal understandings or agreements with some of the members of the association employing the largest number of molders. We go along on the even tenor of our way and meet the foundry man and he sits down and talks to us. We never ask the question, "Are you a member of the association or not?" We never ask that question.

And I might say right here, for the benefit of the record, at least, that in all of our negotiations with the Stove Founders' National Defense Association the question of the union has never been mentioned; there is nothing in the agreement that it shall be an open shop or a union shop, and we have ninety-odd per cent of the stove molders of this union organized, and the word "union" has never arisen between us at all.

Mr. BARNETT. As a matter of fact, what part of the shops of the Stove Founders' National Defense Association are thoroughly organized?

Mr. VALENTINE. Well, of course they are very nearly all organized; there may be one or two that are not, but that is due to local conditions.

Mr. BARNETT. Are there some nonunion men working in all of these shops?

Mr. VALENTINE. No.

Mr. BARNETT. Some of the unions enforce the closed shop?

Mr. VALENTINE. I do not know what you mean by that.

Mr. BARNETT. I mean they will not work with men who do not belong to the union.

Mr. VALENTINE. We do not recognize a closed shop. We refer to a union shop or a nonunion shop.

Mr. BARNETT. What do you mean by a union shop?

MR. VALENTINE. As I understand it, when the union secures a benefit for the molders who work in that shop we feel that the men working in that shop ought to contribute to the support of the organization. We never ask for the discharge of a man, but we might say we will not work with him; that is our right.

MR. BARNETT. That is what the National Founders' Defense Association would call a closed shop?

MR. VALENTINE. I suppose so, but I do not know what is meant by a closed shop. I never object to a man coming into our union who is competent and who wants to join with us. We have never blackballed anybody. We give them all a chance to live, but we feel that when we get a wage rate advanced that a man who works there with us should help to support the union that gets it for him.

MR. BARNETT. Is the question as to whether or not the shops in a particular locality shall be open shops a question decided by the local union? Is that in the hands of the local union? Can a local union waive that rule, or is that a rule that holds in the union?

MR. VALENTINE. Our local union can enforce a strike, or call a strike, without the consent of the national union—the executive board of the national union. We have no independent strikes. Oh, we might for a week or two or three days, and perhaps we have had men go out in the defense association for two or three days, but when we tell them to go back to work they go back to work.

MR. BARNETT. So that the question as to whether or not there could be a strike for a union shop would be a question which would have to come up to the national executive board?

MR. VALENTINE. That is right.

MR. BARNETT. And there are some localities in which such strikes would be authorized and others in which they would not, according to local conditions?

MR. VALENTINE. That would depend entirely upon the position taken by the executive board.

MR. BARNETT. That finishes my examination, Mr. Chairman.

Commissioner WEINSTOCK. You were present yesterday, Mr. Valentine, when Mr. Briggs testified here?

MR. VALENTINE. Yes.

Commissioner WEINSTOCK. I have jotted down here quite a number of statements made by Mr. Briggs, and I am sure that the other commissioners, in common with myself, would like to get your point of view on those statements, if you care to make answer.

MR. VALENTINE. Well, there are one or two that I think I would like to say something about, because I think Mr. Briggs has made a mistake in one or two of them, I think so. Perhaps he is not as well posted as I was on them, and I would like to make a correction of one or two; and I think Mr. Briggs will agree with me.

Commissioner WEINSTOCK. If I mistake not, your document here reads as follows. This is a printed copy of the conference agreement in force and ruling between the International Molders' Union and the Stove Founders' National Defense Association. That is not the association that Mr. Briggs represents?

MR. VALENTINE. No, sir.

MR. WEINSTOCK. That is the one that you work with?

MR. VALENTINE. That is the one that I work with.

Commissioner WEINSTOCK. Among other things, I see that clause 1 reads as follows:

“Resolved, That this meeting adopt the principle of arbitration in the settlement of any dispute between the members of the I. M. U. of N. A. and the members of the S. F. N. D. A.”

I gather from this, then, Mr. Valentine, that your union stands for arbitration.

MR. VALENTINE. In a sense, yes; we do—conciliation. We have never had any experience with arbitration.

Commissioner WEINSTOCK. Will you be good enough, then, to explain, for the information of the commission, in how far you stand for arbitration?

MR. VALENTINE. Well, it is a question of the umpire. As I said before, I do not believe that a doctor or a lawyer, or anybody else, could settle our aches. It might be in a case where a lot of laborers or unskilled men got together and asked for an increase of wages of 5 or 10 per cent, and conditions warranted, and so forth, that they might settle it; but they could not settle anything in our shops, because they do not know anything about it.

Commissioner WEINSTOCK. Then what does that mean, that this meeting adopts the principle of arbitration in the settlement of any disputes between the members?

Mr. VALENTINE. A little further on you will see a statement about conciliation. I suppose the man who wrote that had that in mind—arbitration without the umpire.

Commissioner WEINSTOCK (reading): "That a conference committee be formed, consisting of 12 members, 6 of whom shall be iron molders appointed by the International Molders' Union of North America and 6 members appointed by the S. F. N. D. A., to hold office from January 1 to December 31 of each year.

"Clause 3. Whenever there is a dispute between the members of the S. F. N. D. A. and the molders in its employ, and the majority of the latter are members of the I. M. U., and it can not be settled amicably between them, it shall be referred to the presidents of the two associations before named, who shall themselves, or by delegates, give it due consideration. If they can not decide it satisfactorily to themselves they may, by mutual agreement, summon the conference committee, to whom the dispute shall be referred, and whose decision, by a majority vote, shall be final and binding upon each party for the term of 12 months. Pending adjudication by the presidents and conference committee, neither party to the dispute shall discontinue operations, but shall proceed with business in the ordinary manner. In case of a vacancy in the committee of conference, it shall be filled by the association originally nominated. No vote shall be taken except by a full committee or by an even number of each party."

Well, now, what happens, Mr. Valentine, if this conference is a "hung jury," and can not agree?

Mr. VALENTINE. We have had 24 years' experience, and we have never disagreed.

Commissioner WEINSTOCK. Let us assume that a case may arise to-morrow where you absolutely disagree. What would follow?

Mr. VALENTINE. I do not believe it is possible. You will notice that those agreements that you have read—one is made in 1890 and the other in 1891, and another in 1892 and another in 1893; and if you go along you will come to 1913.

Commissioner WEINSTOCK. Yes.

Mr. VALENTINE. So it shows that these matters always straighten themselves out. We never call in an umpire, because he can not do any good for us at all.

Commissioner WEINSTOCK. Evidently your interpretation of the meaning of the word "arbitration" and mine must differ, because you interpret the word "arbitration," I gather, to mean merely conciliation, and I interpret it to mean that where conciliation fails an umpire shall be called in.

Mr. VALENTINE. We have never had any experience with that, sir.

Commissioner WEINSTOCK. My reason for bringing up this point is this: I read here in clause 1 that you stood for the principle of arbitration in the settlement of any dispute between the members. Mr. Briggs yesterday, as you will remember, made the statement that during the five years in which the New York agreement was in force they could never get the molders' union to consent to arbitration. I wanted to reconcile Mr. Briggs's statement with this resolution.

Mr. VALENTINE. I heard Mr. Briggs make that statement, but if we gave our consent to arbitration there were only a few things we could arbitrate. The association's policy is that these seven or eight things which affect us they would not arbitrate.

Commissioner WEINSTOCK. There were certain things that they would not arbitrate, and there were certain other things that you would not arbitrate?

Mr. VALENTINE. Certainly. It was a matter of principle with us.

Commissioner WEINSTOCK. Then, evidently, the position of both sides was the same—theoretically, they agreed to arbitrate; practically, both sides refused to arbitrate; they on certain points, and you on certain other points?

Mr. VALENTINE. We have never taken up for decision the question of arbitrating. I am speaking as an organization. We felt that we may arbitrate, but if we are going to arbitrate we are going to arbitrate every point of disagreement, and not one of them or two of them.

Commissioner WEINSTOCK. I see.

Mr. VALENTINE. If we are to arbitrate, the other man has got to consent to arbitrate all the points, and not one or two of them.

Commissioner WEINSTOCK. Is there any copy available this morning of the New York agreement? Have you one, Mr. Briggs?

Mr. BARNETT. Here is one.

Mr. BRIGGS. I handed mine to the clerk.

Commissioner WEINSTOCK. It is a short agreement. Will you be kind enough to read it, Mr. Barnett? Just that paragraph that relates to arbitration.

Mr. BARNETT (reading): "That this committee of conference indorse the principle of arbitration in the settlement of trade disputes and recommend the same for adoption by members of the National Founders' Association and the Iron Molders' Union of North America on the following lines."

Commissioner WEINSTOCK. Now, read the lines, please.

Mr. BARNETT (reading): "That in the event of dispute arising between members of the respective organizations reasonable effort shall be made by the parties directly at interest to effect a satisfactory adjustment of the difficulty, and, failing to do which, either party shall have the right to ask its reference to a committee of arbitration, which shall consist of the presidents of the National Founders' Association and the Iron Molders' Union of North America and two other representatives from each association appointed by the respective presidents."

Commissioner WEINSTOCK. And it says something about the decision being binding, does it not?

Mr. BARNETT. Yes. [Reading:] "The findings of this committee of arbitration by a majority vote shall be considered final in so far as the future action of the respective organizations is concerned."

Commissioner WEINSTOCK. That agreement specifically outlines a method of settlement of all disputes by arbitration. It does so without any qualification. It does not say that certain things shall be submitted to arbitration while other things shall not be submitted to arbitration, but it uses a blanket statement there. That was the agreement; but, seemingly, from the statements made by yourself and by Mr. Briggs, that agreement was not carried out.

Commissioner O'CONNELL. That only provides for four. There is no umpire there.

Mr. VALENTINE. I was going to try to bring that out. I would like to have an opportunity to do that.

Mr. BARNETT. That word "arbitration" there used was used very vaguely at that time. It was frequently used to mean what we now understand by "conciliation." The science of the discussion of trade agreements had not gone as far as it has now, and it is possible that the word "arbitration" was used in that rather broad sense to include any peaceful settlement. You will find in other agreements drawn at the same time that the word is used in that broad way.

Commissioner WEINSTOCK. Then really if this agreement was made to-day, with the advanced knowledge that we have of handling labor disputes, the word "conciliation" would have been used where the word "arbitration" is used?

Mr. BARNETT. Yes; I think that is so, from the fact that no methods of arbitration are provided. I think that is what they had in view.

Commissioner WEINSTOCK. You see, then, that with our present point of view this thing is misleading.

Mr. BARNETT. Yes.

Mr. VALENTINE. I wanted, if you would permit me, gentlemen, to make that statement which has, however, been made clearly enough to suit me now.

I want to bring to the attention of the commission this one point: That we worked peaceably and harmoniously with the other association for 24 years with that exact agreement, without being changed at all; 24 years. Our agreements do not provide for an umpire. It is conciliation; that is what it means.

Commissioner WEINSTOCK. Mr. Briggs stated yesterday that in every case of a dispute—I think that was his exact language—in every case of a dispute the unions refused to arbitrate, so finally, in 1904, the employers abrogated the agreement. What is the answer to that statement?

Mr. VALENTINE. I think Mr. Briggs is mistaken in that statement. We have come to a point of disagreement; that may be true, but the reason is that there must have been some reasons why we disagreed. There might be some points that I can not recall now. I hardly think he can. Perhaps he may be able to do it. There were, however, some reasons for the disagreement. I do not know what they were. He said we had 2,500 conferences. I did not know that I had met him 2,500 times in different parts of this country. I did not know that.

Commissioner WEINSTOCK. Mr. Briggs made a further statement; I suppose, giving it as his individual opinion that he believes that individual bargaining will get for the workers, on the average, a better wage than collective bargaining. Will you give us your point of view on that, as a result of your experience as an organized-labor man?

Mr. VALENTINE. I can give you the experience of the organized labor in that direction by citing some cases. In Cincinnati, taking our own home city, our wages used to be \$2.25 a day when we only had 17 members. We might have now a thousand members, and our minimum rate of wages is \$3.50 a day with one hour less per day. We believe we got that through collective bargaining. It might be taken all down along the line. We do not believe that an individual can get any advance in wages or better shop conditions from an employer except under certain conditions. There might be two jobs for one man and the employer might want him real bad and he would do a thing temporarily that he would not do otherwise. That is our experience in the labor movement. If we wait for the average employer to give us shorter hours and increase our wages, we might wait until we come to the time when we have to shake hands with St. Peter.

Commissioner WEINSTOCK. Mr. Briggs also made the further statement that the unions do not come to the employer in a conciliatory spirit, but they come demanding limitation of apprentices, nonintroduction of machinery, closed shop, etc. Will you be good enough to make answer to that?

Mr. VALENTINE. We may have made demands upon the foundrymen for increase of wages and other things. Some people call them demands, and some of them call them requests. I think Mr. Briggs is right when he uses the word "demand," because that is what it means. But as to the things which he has mentioned, I do not know we had any occasion to make a demand for an apprentice ratio, because most of these shops that we struck in the year of which he speaks were union shops and employed the ratio of apprentices, and no man worked in those shops except he was a member of the molders' union. I do not see why we have any occasion to make a demand of that kind. What we did make demand for was an increase of wages. That was refused us.

Commissioner WEINSTOCK. As you will recall, Mr. Briggs also stated that he had a strike in his shop because it was stated by union men that he had treated his apprentices too well.

Mr. VALENTINE. I do not believe he meant that to apply to the molders. I think it was meant to apply to the machinists. A union that would strike a shop because the employer treated the apprentices too well ought to go out of existence. I think we are all trying to encourage the employer to teach the apprentices the trade and use them very well, indeed. The better he uses them, the better we like it. That is the policy of the molders' union, and I think it is the policy of the machinists' union. In fact, I know it is.

Commissioner WEINSTOCK. Another statement was that 2,500 conferences were held under the New York agreement from 1899 to 1904, and an effort to establish arbitration failed.

Mr. VALENTINE. As I said before, I did not know we had 2,500 conferences. We had a great many, of course.

Commissioner WEINSTOCK. I gather from what Mr. Briggs said that these 2,500 conferences include all the local conferences during that period.

Mr. VALENTINE. That is what I say. We did not have any national conferences. They were all local conferences. The question that was involved in the greater number of those conferences was the question of wages. The association injected into those conferences the proposition that, "We will do thus and so." In other words, "We will give you an advance in wages if you will agree to let us operate this machine with handymen, or if you will agree to increase the number of apprentices." That is the reason we did not get together in these conferences. That was the point of difference between us. If you figure them all up, or if Mr. Briggs figures them, you will find the great majority of those conferences were held on the questions of shorter hours of labor or increasing the pay.

Another thing that might have caused the difference was this: We recognize a minimum rate, and we will not allow any one of us to work under that rate, and that association or its representatives may have had this idea at the conference, "We will give you an advance in wages on this class of work if you will reduce to a minimum on this class of work." That we could not do. That might have been the point of difference.

To figure it all up, you will find that the demand or the causes which led to the conferences were due to the fact that we wanted an advance in wages, and it was that year that we could not find molders enough for the foundries of this country. The molders still believe that if we had not had any negotiations with the representatives of the National Founders' Association we could have gotten a much higher rate than we did; and I think Mr. Briggs will agree with

me on that point. We compromised many of these demands when we should have had all of them. The trade conditions were such as to justify us in doing it. I think the foundrymen of the country fared very well indeed in those conferences.

Commissioner WEINSTOCK. It was stated that about 85 per cent of the founders' association will not, since 1904, recognize organized labor.

Mr. VALENTINE. Who makes that statement?

Commissioner WEINSTOCK. Mr. Briggs.

Mr. VALENTINE. I think he has made a mistake in that—85 per cent. I will not say 85 per cent, but I think the majority of his membership now deal with the Molder's Union. I am not sure of those figures, but the largest corporations who are members of that association operate union foundries. I think that statement is very nearly correct.

Commissioner WEINSTOCK. If you were to make an approximate estimate of the members of the founders' association who do deal with and recognize organized labor, what percentage would you give?

Mr. VALENTINE. I could not say; but I will say this to you, Mr. Weinstock, and to the commission: The members of their association are not prevented, so Mr. Briggs stated yesterday, from dealing with us. Perhaps not in a written contract, but a verbal contract; that is the fact. I can go into the office of any member of the association that employs in large numbers and sit down and have a conference with him, and have always been able to do that. We never discuss the association. The foundrymen themselves abrogated that agreement, and without the conference with us and without telling us they wanted to do it. We say, "You have made your own bed; lie in it." We have never had anything to do with it; we have nothing to do with it.

I want to say, in addition, that we are ready and willing to meet them or anybody else on some fair ground where we can talk and do business. That has been the position of the molders' union.

Commissioner WEINSTOCK. Mr. Briggs also said the union fixed the number of apprentices arbitrarily, without being able to explain their ratio.

Mr. VALENTINE. Mr. Briggs did say yesterday—and I was rather amused, and perhaps I was the one that told it to him; I do not know—something about shaking dice. In some of our conferences he did ask how that ratio was reached of 1 to 5, and, probably in a joking way, I did say, "We shook dice for it, Briggs, and that is the way we got it." Perhaps he is right in that statement; maybe we did. I could not tell you how we get that ratio. Our organization was born in 1859, and it has been in existence ever since. I do not know what we did that many years ago. I am well up in years myself, but I do not go back as far as that.

Commissioner WEINSTOCK. There is no scientific basis upon which it is determined, is there?

Mr. VALENTINE. At that time it was 1 to 10, I think, or 1 to 12, and it was modified from time to time by discussion with the employers until it got down to 1 to 8. The representatives of the Stove Founders' National Defense Association said that that did not make molders fast enough to take the place of the old fellows that died or passed out. We said, "Make it 1 to 5," and we will try to reach an agreement on it, and we did. We think we are making molders fast enough. Mr. Hogan might be able to tell you that. He will be on the stand in a little while.

Commissioner WEINSTOCK. You say, Mr. Valentine, the ratio was reduced from time to time, from 1 to 10 in the beginning to 1 to 5?

Mr. VALENTINE. I think so.

Commissioner WEINSTOCK. And yet Mr. Briggs said that the number of apprentices allowed by the molders' union was such that the molders would be almost an extinct species in 20 years.

Mr. VALENTINE. I do not know where he gets his information. You may as well put this in the record, gentlemen, and I want to make this statement in connection with this apprentice question: It is not the apprentice question as such that is disturbing us so much. It is the abuse. There are many employers in this country who are making statements that we prevent the employment of the American boy and do not want to teach him the trade. They are not honest when they make that statement. What they want is a good husky fellow who has not been born in this country and who does not understand what we Americans want, and they use him as a machine, a human machine. He can work in the foundry for 20 years, and after he has worked 20 years he will know no more about the business than he did when he started into the work. That is what

the employers want as apprentices, and that is the kind of apprentices they ask for—a great majority of them.

The molders' union have taken the boys right in Cincinnati at the trade, and tried to get with the employers of that city an agreement whereby we could send the apprentices to school at night, and we did do that for a number of years, until the employers themselves refused to contribute any more. There are many cases where we are doing it to-day, where we can get the boys. But they want apprentices 25 or 30 years of age, when a man is at his best, so they can rush him into the foundry, and then we have to compete with them. That is what many of the foundrymen in this country want. Many of those foundrymen are organized foundrymen, too. In other words, they want to organize among themselves for their own protection, but they do not want to recognize the employee's right to organize for his own protection. That is the truth.

There is another statement I want to write into the record, and that is this: A statement was made yesterday that the principle involved in our minimum-rate question was wrong; that in many instances we drive out a man who has reached an age where you might call him going down the hill. He can not compete with the younger fellows, and we drive him out, it is said. I want to make this correction: I think Mr. Briggs was not informed on that point. The molders' union may establish a minimum rate here in Washington of three or four or five dollars a day, whatever it might be; but when a man becomes aged we give him a card to get the work at whatever rate he can, and when he comes into our foundry I myself, as a molder, have helped a man along during my noon hour, so that he could get employment; and we look after him when he is sick, and we contribute to his welfare. We do not desert that old man. That statement made yesterday was made by Mr. Briggs in ignorance. I do not think he is well informed on that.

Commissioner WEINSTOCK. That is, you maintain that the older men are not held to the minimum. You allow a special card, I suppose?

Mr. VALENTINE. Yes, sir.

Commissioner WEINSTOCK. For those who can not earn the minimum, you issue them a card to allow them to get work at less than the minimum?

Mr. VALENTINE. We permit them to work for whatever rate can be agreed upon between the employer and the man.

Commissioner WEINSTOCK. And you differentiate between the older men and men who are fit?

Mr. VALENTINE. Yes, sir. There was another point brought up yesterday, if I may cover this, too.

Commissioner WEINSTOCK. Go right ahead.

Mr. VALENTINE. The statement was made that we did not allow the employers to discharge a man—

Commissioner WEINSTOCK (interposing). I was coming to that in a moment. Perhaps you had better permit me to follow the points as I jotted them down when Mr. Briggs was on the stand.

Mr. VALENTINE. All right; I just took a note of them.

Commissioner WEINSTOCK. The statement was made by Mr. Briggs that the unions oppose the introduction of molding machines, which have greatly increased the output.

Mr. VALENTINE. I do not know where he got his basis for making that statement. We have never opposed the introduction of molding machines. Our rule recognizes them. Our very organic law requires that. The right of the foundryman to introduce a molding machine is not questioned. As to who shall operate that machine, that is a matter of discussion between the two. I think Mr. Briggs's name is to such an understanding. I think we have your name to that, Mr. Briggs.

Commissioner WEINSTOCK. The point was also made by Mr. Briggs, illustrating a certain concrete case, that the union men made three pulleys a day with a certain labor-saving device, and that the nonunion men made seven a day at the start, and later averaged nine a day.

Mr. VALENTINE. That may be true. I would not dispute that. That might have occurred right in his own shop, but it might have been because the man was arbitrary and would not do any more. On the other hand, it may be that he did not have the facilities for handling the work or equipment. But Mr. Briggs, if he felt that he wanted redress, should have gone directly to the representatives of the molders' union, because he had a union shop at one time, and we could have discussed it. I do not know the case at all.

Commissioner WEINSTOCK. Mr. Briggs further stated that he does not believe trade agreements are suited to industrial peace in the metal trades.

Mr. VALENTINE. That has always been his opinion. He has always had that opinion. I have known him for a great many years and he has never failed to express his opinions emphatically as he did here yesterday. There is no doubt about that.

Commissioner WEINSTOCK. What are the facts?

Mr. VALENTINE. We think one way and he thinks the other. That is all there is about it. We think trade agreements are good things. Our membership occasionally feel this way—to cite an instance to show you what we think of agreements. I think it was in 1904 that we had the big strike from Maine to California, was it not?

Mr. BRIGGS. 1904 to 1906.

Mr. VALENTINE. I know we spent a couple million dollars, and you spent \$6,000,000 in the same time. Our bank account was lessened a great deal. To show you what we think of grievances, we had a strike in Milwaukee on the Allis-Chalmers Corporation. One of the constituents of the company was the Bullock Electric Co., of Cincinnati. We had no agreement with the Allis-Chalmers, but we did with Bullock, and the agreement was in existence for probably eight or nine months after that. The molders wrote down to me and said, "Strike the Bullock shop." I said, "We have an agreement with that shop." The manager of the shop came to the office to see me. I knew him quite well. He said, "Valentine, are you going to live up to the agreement?" I said, "Yes; if it kills us." The shop was not struck and went right along all those months, and we lost the strike at Milwaukee, because of the fact we did not strike at Cincinnati, but we saved our reputation; we saved our reputation; we did not strike.

Commissioner WEINSTOCK. Then you believe in strictly observing your contracts?

Mr. VALENTINE. I do, sir; and the average employer of this country believes in that too—the average.

Commissioner WEINSTOCK. Believes what?

Mr. VALENTINE. Believes in the sacredness of contracts.

Commissioner WEINSTOCK. Believes that the employer should observe the sacredness of contracts?

Mr. VALENTINE. Yes, sir.

Commissioner WEINSTOCK. Mr. Briggs stated as his opinion that the union should remove the limit on apprentices to the use of machinery, and remove the minimum wage. If Mr. Briggs's idea prevailed, what in your judgment would be the result?

Mr. VALENTINE. We would have no reason for getting together in trade unions. We would simply have to depend upon the employer all the time.

Commissioner WEINSTOCK. You mean that would take out the vital usefulness of unionism?

Mr. VALENTINE. That is all there is to it. If we removed those things, we would not have anything else. Mr. Briggs knows that as well as I do. There is no question about that. So do all the employers know that. If we give them all they want there would not be any chance at all. I do not think Briggs would take advantage of us, but I know some of the others might. [Laughter.]

Commissioner WEINSTOCK. The further statement was made by Mr. Briggs that sometimes the founders could not discharge incompetent men without the risk of a strike.

Mr. VALENTINE. Again he is mistaken. There have been instances where we have struck shops because of the discharge of a committeeman, and we have had some committeemen that ought to have been discharged; there is no question about that. But there have been instances where we have done that, and our law says this on that question: It provides that when a committeeman is discharged and the president approves of the case—of him having been ostracised because of union principles or the carrying out of orders of the union—he shall receive a benefit of \$10.40 a week until he gets another job.

Commissioner WEINSTOCK. He shall receive it from whom?

Mr. VALENTINE. From the International Molders' Union. And if you would examine our records at the office you would be surprised to see how many dollars we have paid out and pay every year. Our position is this on that question: There may be, as I said before, isolated cases or aggravated cases where we have had a strike to force an employer to reinstate that man, but

that is because of the employer's position on it; he has been nasty, or something of that kind. But we feel this way: We have the man's interest at heart. Suppose we did strike the shop and we had the might to say to that employer, "You shall put that man back to work." He would do it. If I was foreman of that shop, I would find some way of getting rid of that man. I would find a way in two minutes of getting rid of him. He would make some mistake, and he would be discharged. We prefer to go to the man and we tell him, "This employer does not want you; here is \$10.40 a week to take care of you until you get employment somewhere," and the local union may throw him a few dollars more to help him until he gets employment.

Commissioner WEINSTOCK. You deny the statement that employers can not discharge incompetent men without risk of a strike?

Mr. VALENTINE. I deny—I say that they do do it; and we do not interfere with them except where there are cases where it is absolutely necessary and something ought to be done. It is not always the employer's fault. It is not always the employer's fault, mind you, in the foundry. We are a little different from the other fellow. The foundry may be at 125° this afternoon and tomorrow morning it will be at 65°. We have got different temperatures in the foundry, and we get different with the temperatures; we go up and down with the temperature, occasionally, and sometimes the employer is the best man in the world; he may have what we term an unfair man as foreman, and that foreman will take a violent dislike to John Jones, and he finds some way of getting rid of him. In a case of that kind we sometimes say to that foreman, "Well, you are as bad as the other fellow; I guess you will have to go, too, with the other man." Sometimes we are able to enforce it and sometimes we are not, but we always go to the employer and tell him what is going on, and I do not know of any case the last year or two or three years where we have struck any shop to reinstate a man. The employers have sometimes quietly dropped the foreman, who is not the best man in the world. We investigate, through one of the national officers, cases of that kind, as a rule. We take time to do it.

Commissioner WEINSTOCK. You think, then, that sometimes friction has arisen from the fact that because of the character of the work the men are more or less mercurial in temperament?

Mr. VALENTINE. Oh, yes.

Mr. BRIGGS. They sometimes approach a committeeman when it is a hot July day, when the foundry is at 150°, and it is hot outside and a man's tongue is hanging out; and I would not talk to him under those circumstances, because you can not get the same satisfaction out of it.

Commissioner WEINSTOCK. Mr. Briggs further said that he does not believe that unionism has made for higher standards, for more sobriety, or more intellectual development among the members. What is your experience in regard to that matter?

Mr. VALENTINE. To the contrary. We think it educates people and gives them better opportunities after they are educated, and makes them feel that they want to be good citizens, and the trades-union movement brings that about, in our opinion. Of course, if I was an employer and I wanted to invest a dollar, and I felt as though I should have a dollar and 10 cents in return for the investment, I might take it out of labor, if they would let me. Some of the employers will get it that way. They do not like the trades-union, because the trades-union makes them pay more than they would otherwise pay. It makes them give a man a chance to get to his family at a seasonable hour. In the wintertime, especially, when a man leaves his home in the morning it is dark and when he gets home it is dark, and sometimes that is the way in the summer in the foundries. We feel as though we wanted a man to get acquainted with his child by daylight, so as to know him; so as to know him on Sunday, when he has got his face washed.

Commissioner WEINSTOCK. Mr. Briggs further said that in his opinion it is an injustice for the American Federation of Labor to insist upon a uniform eight-hour day for all classes of labor; that in his judgment, for example, 10 hours for the machinist is not nearly so enervating as eight hours in the drafting room, and so on, and that therefore there ought to be differentiation of hours among the different classes of workers.

Mr. VALENTINE. There might be some merit in that. I have never given that any thought on that phase of the question at all. I heard him make the statement last night and I thought that it was well put, in a way. Of course I

would want to know just what he meant by that, generally. He made a general statement here.

Commissioner WEINSTOCK. Mr. Briggs also called the attention of the commission to the statement that this commission will be considering the welfare of 90 nonunion men as against 7 union men.

Mr. VALENTINE. That might be due to many causes. I heard a statement made here by Mr. Hayes, I think it was, and I think there is a good deal of truth in it. There are a lot of men that want to be organized, but the condition is such that they can not accept organization unless they accept discharge with it. There are a lot of men who would like to be organized, but it means discharge. I have in mind some places in eastern Pennsylvania where we have been, where molders were told that if they joined the molders' union they would be discharged. My advice to those men, after looking over the situation, was "Do not join the molders' union. You can not afford to throw up your home now. It is only half paid for. You can not afford to sacrifice your wife and children. Stay out of the molders' union until such time as you get in a position to join it." There might have been cases of that kind; I know lots of them, and I guess that applies to all trades.

Commissioner WEINSTOCK. That is all, Mr. Chairman.

Commissioner BALLARD. I was going to ask you about the point brought out by our counsel, about a uniform base rate, and the statement that the molders throughout the United States make about the same wage per day. Is that what you mean by a uniform base rate?

Mr. VALENTINE. No; we establish a minimum wage rate.

Commissioner BALLARD. Wage per day?

Mr. VALENTINE. Wage per day. To illustrate what I mean: At Cincinnati we have a \$3.50 minimum for molders. There are molders in Cincinnati getting \$4.75 a day on their merits, who are paid the difference between \$3.50 and \$4.75 by the foundrymen.

Commissioner BALLARD. The last question he asked was about the union shop. I understood you to say that the union shop was where the union conditions prevail. Is that always enforced? Where you have a union shop, are the workmen always exclusively union men?

Mr. VALENTINE. Yes.

Commissioner BALLARD. Where you have a union shop that is so?

Mr. VALENTINE. Yes.

Commissioner BALLARD. Do the molders' unions indulge in sympathetic strikes at all?

Mr. VALENTINE. Not to any great extent. In fact, I can not say that we do. There are reasons why. We believe in the principle of helping one another, though.

Commissioner WEINSTOCK. How about when a contract is in existence?

Mr. VALENTINE. We keep our contract.

Commissioner WEINSTOCK. You do not go on sympathetic strikes when you have a contract?

Mr. VALENTINE. No, sir; we go on strike to save ourselves—I cited the case of Cincinnati—as much as anyone else.

Commissioner DELANO. We are confronted by the situation that your union has been successful in carrying out trade agreements with one association and has been unsuccessful with another. Will you explain the reason for that? I infer that you would not take the position that foundrymen as a class are less fair than stove manufacturers, as a class?

Mr. VALENTINE. I will tell you how I view that thing. I have studied it for several years. I think it is just simply the impatience of the foundrymen or some of them, to reach an agreement on questions that it has taken us years to educate our members up to, or years to have them educate their members. For instance, I cited the Utica case here. The workmen were wrong in taking that position. They subsequently acknowledged that they were wrong. That caused bad blood between the two associations. There was not any need for it. But very often we try to do something in a month that ought to take a year to do it, and I think that is the trouble between the moulders' union and the National Foundrymen's Association. They sit down and talk, and somebody moves to adjourn sine die. If it is from the other side, we have got to second the motion—can not help it; but I do not believe they ought to adjourn in that way. They ought to adjourn to meet again when they are in better humor. I

do not think you can settle these things in a minute. I think that is the trouble between us.

Commissioner DELANO. You did not quite answer my question; that is, is there any difference either in the trade or in the class of the men on the employers' side; because Mr. Briggs, as I understood, made the point that the foundry business was very much more complex, that it represented very much differentiated classes of business running from a few ounces to many tons, with very small factories and very large ones, whereas in the stove business it was not so differentiated. Is that the explanation?

Mr. VALENTINE. Well, that has something to do with it. I think Mr. Briggs is pretty near right on that thing, from that viewpoint. There is a great deal of difference in the various foundries as represented through his organization. As he said, there are some that make an ounce and some that make 20 tons, and that may have a little bit to do with these things; but I think we could overcome those.

I would like to make one little statement to clear up something said yesterday, with all due respect to Mr. Briggs, who made the statement, that the cause of the Milwaukee strike was the refusal of the molders' union to allow more apprentices.

I do not know whether Mr. Briggs is acquainted with the causes which led to the strike of the molders, but the molders' strike in Milwaukee was because we wanted the same wage rate for core makers as we had for molders, and the employers did not want to recognize that. The question of the employment of apprentices never came up, not in any argument that I had, it never was discussed. In fact, the shops in Milwaukee, many of them, before the strike were what you would term, many of them, union shops.

There is another thing I want to bring up, the point in the outline of policy—have you got that, Mr. Chairman—or the constitution? I haven't got one with me.

(Here Commissioner Weinstock handed the paper referred to to Mr. Valentine.)

It refers to the limitation of output. It says:

"Arbitrary limitations of output on the part of the molders, or arbitrary demands for an excessive amount of output by the molders on the part of the foundrymen, being contrary to the spirit of equity which should govern the relationship of employer and employee, all attempts in that direction by either party—the molder or foundryman—are to be viewed with disfavor and will not receive the sanction of this association."

I want to say for the benefit of this commission that we are the authors of that; we wrote it; our pens wrote it, and it was adopted at a meeting in Cleveland, at which the Cleveland strike was settled, and we believe in it.

On the other hand, we claim that it has been violated in this respect: It says arbitrary limitations of output on the part of the molders and arbitrary demands for excessive amount on the part of the employer.

Now, the foreman of the shop takes a good, strong, husky fellow, and he says, "John"—sometimes he gives him a few extra pennies—"I want 10 of these to-day." John makes 10. The foreman in a week from that gives that job to another man; he is not so strong, but he says, "Tom, 10 of these is a day's work; John So-and-so made 10."

Now, some of the foundry men say that that is not an arbitrary demand on their part. We claim it is. We claim that all men are not physically alike, mentally or mechanically, and consequently they can not do as much as the other fellow. Our difference on that thing, where we divided, was that the foundry man could do as he pleased, through his foreman, and if we attempted to say to our men, "You can not do so much as that," why, we were violating this, but the foundry man is not violating it. That is all.

Commissioner COMMONS. Mr. O'Connell?

Commissioner O'CONNELL. What I wanted to find out has been asked.

Commissioner COMMONS. Mr. Lennon?

Commissioner LENNON. Mr. Valentine, going back to the question of arbitration as it appears in your constitution and in your dealings with the defense association, if you met in conference to adjust a matter is it not a fact that in that instance you adjourn that conference and meet again at some future day; that is not the final show-down; that the conference continues from one time to another, until, perhaps, in 10 years, if necessary, you have reached an adjustment without bringing in an umpire? Is not that the situation in that instance?

Mr. VALENTINE. Absolutely correct, absolutely.

Commissioner LENNON. Now, in talking about the union shop I want to emphasize here for the benefit of all, as long as the opportunity presents itself, that organized labor does not accept, and absolutely refuses to accept, the definition of the open and the closed shop; it is a misnomer and does not apply. Now, Mr. Valentine, as to the admission of members: Suppose in some of the shops where all union men are employed the foreman employs a nonunion molder; do you raise a row about it?

Mr. VALENTINE. No; we let him go to work, and when it comes pay day he goes into the union, and in very many instances he is a good fellow and the molders go down in their pockets and put up for his initiation fee and he pays them back.

Commissioner LENNON. It is a fact, then, that the membership of the molders' union is created more by the action of the employer in hiring men than it is by the initiative of the molders' union?

Mr. VALENTINE. Correct you are; that is right.

Commissioner LENNON. You talked considerably, and others have talked considerably, about the subject matter of apprentices. Is it not true that the development of the limitation of apprentices of the extension of the limitation to allow apprentices has grown up because of the necessities of the business, because of the expansion of trade and the fundamental view of the organization is not to from time to time make an apprenticeship rule to conform to the probable needs of business in the future?

Mr. VALENTINE. Yes.

Commissioner LENNON. What do you find the causes to be, if there be any, of industrial unrest among the molders of the union?

Mr. VALENTINE. Simply a desire to get more wages and better shop conditions, and so forth, which they think they are entitled to. Their wives go to market to-day and can not buy for a dollar what they used to buy for 50 cents, so she goes back and finds fault, and he finds fault, and he goes to the employer and he says, "I want more money," and his employer says, "No; no. Business is bad; I can't give it to you," and then they fight about it. That is the way it is.

Commissioner COMMONS. Mrs. Harriman?

Commissioner HARRIMAN. Does your union oppose the introduction of modern efficiency methods?

Mr. VALENTINE. No; not at all.

Commissioner HARRIMAN. What effect have technical schools had on your industry?

Mr. VALENTINE. None to any great extent.

Commissioner HARRIMAN. You believe in that training?

Mr. VALENTINE. Yes; I will say the reason is it is such hard work that nobody wants to work at it. I guess that is the reason.

Commissioner HARRIMAN. Can you offer any information of why less than 8 per cent of labor is organized? That is the figure that was given here—less than 8 or 10 per cent?

Mr. VALENTINE. I do not know whether those figures are correct.

Commissioner HARRIMAN. Whatever it is, it is a small percentage?

Mr. VALENTINE. I haven't given it any thought.

Commissioner O'CONNELL. 2.81 per cent.

Commissioner HARRIMAN. No; that is of all the 90,000,000. I meant of labor, the working class; they said less than 8 per cent. You have no explanation of why there is such a small number.

Mr. VALENTINE. No; I do not know anything about the figures.

Commissioner HARRIMAN. What, in your opinion, is the best way to establish and maintain industrial peace? What would be the best way?

Mr. VALENTINE. Through trade agreements with the employer, honestly made, and trade agreements that are broad enough to permit both sides, both parties to it, to discuss any dispute that may arise under it threadbare, honestly. That is all there is to it, on the part of both.

Commissioner WEINSTOCK. Yes.

Mr. VALENTINE. You are familiar with the situation in San Francisco, of course?

Commissioner WEINSTOCK. Yes.

Mr. VALENTINE. We are both from San Francisco originally. You know the strike there for the eight-hour day?

Commissioner WEINSTOCK. Yes.

Mr. VALENTINE. When thousands of people were on the street, everybody was out, the street car men were on strike, you could not talk over a telephone.

Commissioner WEINSTOCK. And the telegraphers?

Mr. VALENTINE. They were on strike; and you couldn't get a shirt washed, because the laundries were on strike; all the iron trades were on strike; everybody was on strike; everybody was strike crazy. The iron trades wanted an eight-hour day forthwith, and the town was in turmoil. It had been visited by a fire and an earthquake, and it was all turned topsy-turvy and we were all out of work, everybody wanted to work eight hours. You remember the conferences which were held with reference to this matter, and when the employer says, "We believe in the eight-hour day," they said that it would eventually come, and the suggestion was made, "Let's get together and see if we can not settle that thing." Well, we got together, and we said that the eight-hour day would come in three years, and when we got through with it the representatives of both sides, both the employers and the molders' union, and the machinists' union and everybody said that it was no good; that one had sold out to the other, because it was not quite the right way.

Mr. WEINSTOCK. You mean that the workers found fault with the two representatives of the employers and the workers who entered into that graduated reaching of the eight-hour day?

Mr. VALENTINE. The employers found fault with Mr. James Kerr.

Commissioner WEINSTOCK. Who represented them?

Mr. VALENTINE. Yes; and the workers found fault with me representing the workers.

Commissioner WEINSTOCK. That is, the power had been concentrated in you two men to adjust that difficulty?

Mr. VALENTINE. Yes; they gave us power to do it, and we drew up that agreement making an eight-hour day in San Francisco.

Commissioner WEINSTOCK. In three years?

Mr. VALENTINE. Yes.

Commissioner WEINSTOCK. Dropping off a quarter of an hour every six months?

Mr. VALENTINE. Yes. All the unions, some of them that I addressed—one of the unions in particular—some of the members had little bits of tin horns, and they had dried peas with them, and when I was on the platform they blew them at me and hit me in the face; but we eventually got organized labor to accept this agreement, and the employers virtually accepted it, too, and to-day we have peace in San Francisco, and we do not have any umpire. We had two men to take hold of it that had nerve enough to settle it, and they settled it, and your explanation of the situation in San Francisco yesterday was a very agreeable one to me, sir, to find out that it worked out so nicely, because everybody said the town was going to the bowwows, and it did not; it is one of the best towns on earth to-day.

Commissioner WEINSTOCK. For the benefit of the record I want to add this statement: When the three-year agreement that Mr. Valentine speaks of neared its completion the employers of the Metal Trades Association took the ground that when they had signed that agreement three years before, the one that Mr. Kerr and Mr. Valentine determined upon, they were led to feel, although it was not written in the agreement, that at the expiration of the said three years the eight-hour day would be a common day on the Pacific coast; that the three years were about to end, and the eight-hour day had not become a common day on the Pacific coast; and that if the employers of San Francisco were to go on the eight-hour basis it would place them under a very serious disadvantage with competing cities; therefore, since the eight-hour day had not been made a common day, they felt it was unjust and unfair for the unions to insist upon that eight-hour day prevailing.

A conference was called of the two sides, and they were unable to come to an understanding, so the matter was referred to a conciliation board—a conciliation board that had been created by the selection of 12 men from the chamber of commerce representing the employers and 12 men from the trade council representing the workers, and out of this panel of 24 men the metal-trade employers selected 3 employers, of which I happened to be one and the iron trade council selected 3 workers, constituting a jury of 6 without an umpire—to determine whether the eight or nine hour day should prevail.

This subcommittee of six when they first got together were widely apart, but after hearing both sides to the controversy they reached the unanimous conclusion that the eight-hour day should be given a year's trial, and that if

at the end of the year the conditions were not satisfactory the matter could be taken up again. That recommendation was finally accepted by both sides, and the matter went on for a year on the eight-hour basis. At the end of the year there were some differences arose, and the matter was again referred to this subcommittee. The subcommittee rendered its judgment on the matter. The ultimate result was that the eight-hour day continued for a period of two years longer; that is, this conciliation board recommended at the beginning that a new three-year contract be entered into, that the eight-hour day be tried for one year, and that if at the end of the year the conditions were not satisfactory the hours could be changed for the remaining two years of the contract.

The outcome of it was that the eight-hour day prevailed for the full three years, and at the end of three years, while the contract was not renewed, the eight hours still continued and are in force in San Francisco to-day.

Mr. VALENTINE. All I can add to that, Mr. Weinstock, is that your decision, because you were a member of this commission—you did not have any umpire to decide whether it was right or not; you decided it yourself; there was no umpire; there was arbitration and conciliation. And I bring that up for this reason, to show that when there is an honest difference of opinion between two parties, if they will sit down and talk it over right, as two honest people should talk it over, they may not reach an agreement to-day, but they will some day. That is the position. It is honesty. A question submitted to an umpire means compromise; that is what it means as a rule, and I believe if one party is right they should have it all, and if they are not right they should back away; that is all.

Commissioner WEINSTOCK. I take it that the thought you have in mind is this, that where two parties get together, and one party tries to get some unfair advantage over the other party, an agreement is hopeless, but when both parties get together and seek only equity that in the end they are likely to come to an agreement.

Mr. VALENTINE. Yes.

Commissioner COMMONS. I would like to ask one or two questions, unless you desire to ask more, Mrs. Harriman.

Commissioner HARRIMAN. No.

Commissioner COMMONS. Your situation has already been suggested, and your situation is a very important one for this commission, to make up its mind whether it wants to make a recommendation, for example, that in all lines of industry the injunction that Congress has placed upon this commission to determine the underlying causes of unrest, and to recommend remedies for it—and the question arises at once whether we should recommend the adoption of a trade agreement in all industries. Now, you have given your situation, and it ought to throw a great deal of light upon that. It might make it possible for this commission to recommend that for some industries a trade agreement would never work, and would not be a remedy, and that therefore this commission would have to classify the industries into such and such industries; and that in this or that industry an agreement will work, and in some others it will never work. Now, if that is true, it would be necessary for us to analyze the question somewhat and determine some principles of classification by which you could say that in industries which have such and such peculiarities we think that arbitration or conciliation or a trade agreement in any form will not work. Now, as it strikes me, as the question has been raised by your answer, we can eliminate the question of personality of the employers and employees; and, apparently, we can eliminate it in your case, so far as the employers are concerned, because I take it that it is the same board, the same executive board of molders that deals with the S. F. N. D. A. as with the National Founders' Association.

Mr. VALENTINE. How is that?

Commissioner COMMONS. The same executive committee of the molders' union dealing with the founders' association, and continues to deal.

Mr. VALENTINE. With the same questions; there may be some differences by reason of the fact of having the stove molders on the other, and the fact that is dominated by the same spirit and the same officers.

Commissioner COMMONS. So far as your observation goes, there were no members of your organization dealing with the National Founders' Association who would have made an agreement impossible with the National Founders where they would have made it possible with the stove founders?

Mr. VALENTINE. I did not quite catch that, Professor.

Commissioner COMMONS. That is to say, your union came to the National Founders in the same spirit and the same conciliatory attitude in the case of the National Founders as they did in the case of the stove founders?

Mr. VALENTINE. Absolutely so.

Commissioner COMMONS. Would you be willing to say that the National Founders' representatives were less honest or less conciliatory than the representatives of the stove founders?

Mr. VALENTINE. No; I would not say that. I think there is a difference in men, in temperament and nature, and so on. I would not say that. There are as many honest men, and good, fair men, who are members of the association as there are among the others.

Commissioner COMMONS. Did you find any temperamental difference between the representatives of the stove founders and of the National Founders?

Mr. VALENTINE. I will tell you what we found. With the stove founders we had to meet practical men, to take up practical questions. In the other association we had to meet, sometimes, the owners of foundries or superintendents that did not know anything about the business; and we had to meet men who were employed by the association who never saw the inside of a molding shop until they became employees of the association.

Commissioner COMMONS. What profession did they represent? Were they lawyers?

Mr. VALENTINE. Some were lawyers, some were stenographers, and some were something else.

Commissioner COMMONS. Then, according to that, I would understand that an employers' association, in order to be successful, must have as representatives the employers themselves, directly owning and operating establishments. Is that necessary?

Mr. VALENTINE. When we meet men to settle technical disputes, the men on both sides ought to know what they are talking about, otherwise they will not agree. The representative of the defense association is here, and I met him a couple of weeks ago and I took off my coat and we went down into the foundry and we got at the root of the thing. It only took us a few hours to settle it.

Commissioner COMMONS. Was he an employer or a subordinate?

Mr. VALENTINE. He is the secretary of the association, but he is an old-time molder, and we can not fool him a little bit.

Commissioner COMMONS. He is employed by the association?

Mr. VALENTINE. Yes, sir.

Commissioner COMMONS. But are the representatives of the stove founders that deal with you all practical foundry men, owners of establishments?

Mr. VALENTINE. We only have one or two to deal with. We have the secretary and the assistant; that is the only appeal we have. We can go to the president of the association occasionally, but our rules provide that if the committee in the shops can not adjust whatever grievance may arise it is referred to the two national associations. Representatives of those associations, or organizations, are the officers of the molders' union and the officers of the National Founders' Defense Association, and their officer is a man who molded, himself; he knows how to make a mold.

Commissioner COMMONS. What I am trying to get at is this: Is the constitution of the National Founders' Association such that it can not be hoped that such representatives will come out of that organization as would be competent to meet the molders in such a way as the stove founders meet them? That is, have they some method of selection, some method of organization, which is defective for the purposes of trade agreements?

Mr. VALENTINE. I do not know that; I do not know anything about that.

Commissioner COMMONS. But you do think that, whatever it is, it does bring men to the front who are not practical men?

Mr. VALENTINE. That is my feeling in the matter.

Commissioner COMMONS. You do not ascribe that to Mr. Briggs?

Mr. VALENTINE. Not at all. I do not know whether Mr. Briggs ever molded at all. I do not know whether he did or not.

Commissioner COMMONS. In so far as you have dealt with that association, have you dealt mainly with Mr. Briggs?

Mr. VALENTINE. In a great many instances; yes. We have dealt with him. He has been at the conferences.

Commissioner COMMONS. Would he not dominate the conferences, naturally?

Mr. VALENTINE. I do not know. They adjourned, very often, and went into

a little corner among themselves, and I don't know who dominated the conference.

Commissioner COMMONS. You think men who are not practical, or, we will say, stenographers or attorneys who had to make out a case whether or not, dominated that organization?

Mr. VALENTINE. I mean this, Professor, that if there is a question of dispute as to the making of the price, or the making of a piece, the only people who can adjust that are the two people who understand the making of it. They are the only people who can adjust it. No one outside of them can adjust it. If we are going to adjust it on its merits, a man who does not know anything about molding can not tell anything about it.

Commissioner COMMONS. Do you mean to say that the National Founders' Association is dominated by that type of men who do not know how to deal with the case as it arises?

Mr. VALENTINE. I will say this: That they displayed in these conferences, a desire to wind the thing up quick; as some of them said in the conference, the only way to deal with molders is to cut off their ears quick. That was said. That was the spirit; but in cutting off men's ears the men who had to have their ears cut off were there; that was the trouble.

Commissioner WEINSTOCK. What was meant by "cutting off their ears quick"?

Mr. VALENTINE. I do not know what was meant by it.

Commissioner COMMONS. To take up the next question that I have in mind: There are certain classes of issues that come between you; whether or not the issues are such that they can not be settled in the case of one industry and can be settled in the case of another? For example, in the Stove Defense, you seemed able to equalize piece rates throughout the country. That does not equalize earnings, of course. But in the National Founders you are not able to equalize piece rates, because there is such an enormous variety, and they are not always competing with each other. Does that bring up an issue that can not be settled by a trade agreement? Is it essential that you have a uniform national minimum wage in order that you may deal with the whole foundry industry?

Mr. VALENTINE. No, sir. If both sides, say, the representatives of the associations, the National Founders' Association and the molders' union, were to meet in a room to-morrow, and both would agree as to the treatment of all the points of difference we were both interested in, and we would talk them all over, we could possibly reach an agreement, but if one side says: "Here is an apprentice. You prevent the American boy from being taught a trade, and we will not arbitrate that with you"; we can not get along with that association. We have some say in that, too, as well as he does. That is the difference between us and that association.

Commissioner COMMONS. Pending the settlement of an issue of this kind, one side or the other is always going to have an advantage, is it not, while it is unsettled? If you retain the status quo, it must be that in some instances the union has the better of the situation, and in the other instances the employer has the advantage of the situation. Is not that true in all cases?

Mr. VALENTINE. That is true, Professor; yes.

Commissioner COMMONS. And then, whichever side is at a disadvantage wants an immediate settlement, and whichever side has an advantage wants a delay in settlement?

Mr. VALENTINE. That is true in a sense, too; but we ought to strip that of those possibilities, to prevent those things arising. Both associations, if they want to come together to deal, must say this: "That all of these things that arise in the foundry you have as much say about as we have. Let us sit down and talk it over." If I were to say to the representatives of the association, "Here is a thing that we will not discuss with you," the association would say, "Well, we can settle everything but that, and that will be the point of disagreement." If I am going to be a lion, I want to meet a lion; I do not want a lamb to meet a lion. That is the way I feel about that thing.

Commissioner COMMONS. Take the issues that came up during these four or five years. I take it that from the period from 1899 to 1903 or 1904 the industry was quite prosperous, prices were going up, and consequently if the employers could retain the status quo, then the molders could not get an advance in wages, and the employers would gain, during that period of rising prices and prosperity. Is not that the situation?

Mr. VALENTINE. Yes, sir.

Commissioner COMMONS. After 1903 we had a depression; prices were falling, and if there was no settlement made now, after 1903, then the gain would go to the union, because the employer would be less and less able to pay the wages?

Mr. VALENTINE. That brings us to the point.

Commissioner COMMONS. The question is: Would the statistics of your disputes show a difference in the grievances? They were mostly for raising wages, as I understand, and for limiting hours. Was that true throughout the whole period?

Mr. VALENTINE. Altogether. My statement was this in the beginning of this talk: That what caused the abrogation of the New York agreement in this dull time, was, the employers said they wanted a 15 per cent reduction in a certain place, and we refused it; but we did not refuse them a conference. We felt that the ache belonged to them, and it was their duty to call upon their association and call a conference meeting; but they did not do that. They were advised to put it into effect at once, forthwith, and then it would be our trouble.

Commissioner COMMONS. Apparently both sides had strikes or lockouts, because of the delay in having a conference. One side must have tried to force the other side by a strike, because it would not agree to a conference; or the employers would occasion a lockout because the union would not agree to a conference. The difficulty of the machinery lay, did it not, in the fact that you could not bring about your conferences promptly enough to settle the dispute, else there would have been no strikes or lockouts?

Mr. VALENTINE. Yes; we could bring about the conference. I do not know that there were any delays in these conferences to speak of, but when we did meet in conference we had these various points to discuss which we could not agree upon. For instance, if it was a question of the raise of a wage, or a reduction in wage, that issue was not alone the issue. It might have been with us in the start. The employer would say "Yes; but we want this and we want that"; and they grasped after something that they could not have without thrashing us to get it. That was the trouble between us. You will find that the reason why we held a number of these conferences was the question of wage rates.

Commissioner O'CONNELL. That same machinery exactly is in force for the advantage of both organizations—both the stove founders and the other?

Mr. VALENTINE. The same thing.

Commissioner O'CONNELL. The same machinery is there with which you have succeeded for 24 years in getting along without a strike; that same machinery is at hand for the other?

Mr. VALENTINE. Exactly the same.

The ACTING CHAIRMAN. It seems, in the case of the stove founders, some issues were delayed 10 years before settlement was made. How could you succeed in having a delay of 10 years on those questions in the case of the stove founders and yet must have such prompt action in the case of the founders?

Mr. VALENTINE. Because both of us felt it would be better to take 10 years to settle it, and set it right, rather than have a strike and have a "might settle it." It is settled right now.

The ACTING CHAIRMAN. Meanwhile, both sides were for 10 years going on with one side having what turned out eventually to be an unfair advantage?

Mr. VALENTINE. That may be.

The ACTING CHAIRMAN. So under this system we must have people who may be willing to accept unfair advantages for 10 years?

Mr. VALENTINE. It might be. Right will prevail in the end.

The ACTING CHAIRMAN. I suppose the ability of an employer to maintain an unfair disadvantage of this kind would consist in his power to fix the prices of his product, would it not?

Mr. VALENTINE. I do not understand your point.

The ACTING CHAIRMAN. If competition were very severe among employers in that line, then they could not stand 10 years' waiting under an expensive disadvantage?

Mr. VALENTINE. I do not know that that case would arise in that way. We are talking about a different proposition. One is a matter of principle, and the other is a question of wage rate. For instance, it costs a man to have a reduction in wages in order to compete with the other fellow. We can settle that without having very much trouble about it.

The ACTING CHAIRMAN. That is, would you be willing to place the National Founders on a competitive equality with their competitors?

Mr. VALENTINE. I will say what we have done. With the defense association we have never had a reduction in wages. The first advance in wages that we got, after getting together—and we were both about tired out when we did get together—was agreed to, and we decided we would go along those lines, and in 1899 we got the first advance of wages. We have 35 per cent now in advance. In 1893, when we had the panic, the employers said they wanted a reduction. We said "We have got to give it to you." Then the employers came back and said "It will not do us any good, or you any good, and we do not need it." That is the spirit in which we met. They would not sell them another stove.

The ACTING CHAIRMAN. Do you understand why they agreed to that was that they controlled the industry pretty fully throughout the country, and that they had a stove manufacturers' association, which is practically the same as the Stove Defense Association, and that while they made an agreement with you, they could turn around and maintain prices on the other hand that would enable them to pay you the wages which they consented to pay?

Mr. VALENTINE. You may think that. Mr. Hogan can answer that on the stand, when you put him on the stand. Let me say this to you, that there is no truth in that. They do not control prices, and have not been able to control prices. I know what I am speaking of. I know in certain localities there are others who would jump in and take the trade away from them. Then they have to alter their stoves every two or three months in order to get in again.

The ACTING CHAIRMAN. How many manufacturers of stoves are not in the Stove Defense Association?

Mr. VALENTINE. I could not say that; I do not know. The defense association was formed, but has no commercial bearing. We do not know anything about their commercial business.

The ACTING CHAIRMAN. I am speaking about it from your viewpoint. Do you deal with the stove founders who are not in the defense association?

Mr. VALENTINE. Yes; we deal with stove founders who are not in the association, and they do grant the advances or take advantage of any reductions, just the same. We do not deal with them at all except singly.

The ACTING CHAIRMAN. You deal with them as individuals?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. Then do you require the stove founder who is not in the defense association to pay the same prices as the stove founder who is in the defense association?

Mr. VALENTINE. The same percentage.

The ACTING CHAIRMAN. Do you put his molders on competitive equality with the stove-defense molders?

Mr. VALENTINE. We do when we have the opportunity.

The ACTING CHAIRMAN. Then it would follow from that that a stove founder who is not a member of the defense association could not cut prices, so far as labor cost is concerned. He would have to maintain prices?

Mr. VALENTINE. During that year.

The ACTING CHAIRMAN. During that year?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. So there would be, through your system of controlling all of the stove founders, a certain power in the stove industry to maintain prices?

Mr. VALENTINE. I do not know of it. I never heard of it. I do not know much about the commercial business, but I know that the competition is very keen.

The ACTING CHAIRMAN. How large is your control of the foundries of the country outside of the stove foundries? Can you figure that? You apparently control all the stove foundries in the country. How large an element is outside of the National Founders' Association that employs molders? Some figures were given here, but I do not remember them.

Mr. VALENTINE. I could not answer that. I have not the data with me and do not know anything about it. I could not even approximate it.

The ACTING CHAIRMAN. Seeing you control 90 per cent of the stove foundries, would you say you control 50 per cent of the general machinery foundries?

Mr. VALENTINE. I could not give you any percentage at all. It would be a very bad guess if I did. I have no means of knowing that.

The ACTING CHAIRMAN. Would you think it is a less per cent than you control in the stove foundries?

Mr. VALENTINE. I would think so, but I do not know.

The ACTING CHAIRMAN. You do not know how much less?

Mr. VALENTINE. No.

The ACTING CHAIRMAN. There is one other line about which I would like to ask some questions. In the stove industries, and other industries, there is a large element of common labor, or foundry laborers, who are not eligible to the molders' union. What would that proportion amount to in a typical stove foundry?

Mr. VALENTINE. That would be a smaller percentage than it would be in the other foundries. I do not know just how many it would be. We do not admit anybody except a molder.

The ACTING CHAIRMAN. Does your organization have any sympathetic cooperation with these foundry laborers to enable them to maintain wages and conditions?

Mr. VALENTINE. We do wherever we can be of assistance.

The ACTING CHAIRMAN. Could you give any examples of what you have done?

Mr. VALENTINE. We have not gone on strike to do it. I have, in my own personal way—and I presume other officers have done it, too—assisted them in this way: In discussing matters with the owner of the shop, I have been appealed to by representatives of other people that were not organized and have got a change in conditions for them. We have done that.

The ACTING CHAIRMAN. Have you tried to organize the foundry helpers or foundry laborers in any way?

Mr. VALENTINE. No; we have not done that.

The ACTING CHAIRMAN. And you have not tried to promote or father any organization of them?

Mr. VALENTINE. We have not done that. We are members of the metal-trades department.

The ACTING CHAIRMAN. Your organization is a member of that department, is it?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. Is it a part of the policy of that department to organize all the laborers in a foundry?

Mr. VALENTINE. It is the policy of the department to organize in their respective unions every one that works in the metal trades.

The ACTING CHAIRMAN. Where would the foundry laborers come in in that metal-trades department?

Mr. VALENTINE. They would come in the National Organization of Foundry Employees. There is a national organization, and they would come in under that.

The ACTING CHAIRMAN. If this National Organization of Foundry Employees is then encouraged by the molders' union, the hope is that every employee in a foundry will be organized?

Mr. VALENTINE. Yes. We have gone so far with them as to adjust their differences for them with the owner of the shop.

The ACTING CHAIRMAN. Would this metal-trades department, then, controlling all of the employees in the establishment, make an agreement as the metal-trades department with the foundry men?

Mr. VALENTINE. It could, with the consent of all the trades affiliated with the department.

The ACTING CHAIRMAN. Are you so organized that you have an executive council representing all the trades that could make an agreement?

Mr. VALENTINE. We have; but we are not up to that perfection yet in the metal trades; we have not arrived at that point.

The ACTING CHAIRMAN. Is that one of the aims that you have?

Mr. VALENTINE. The aim of the department, in my judgment, would be to bring about thorough organization among the employees working in the metal industry.

The ACTING CHAIRMAN. Which means organization of everybody in the establishment?

Mr. VALENTINE. In their respective organizations; not in one, but in their respective organizations—the machinists in the machinists' organization and the laborers in the foundry employees' organization.

The ACTING CHAIRMAN. Could the metal-trades department as now organized prevent one union from going out on strike if the others did not consent?

Mr. VALENTINE. We could by advice, etc. I do not know that there is any law to prevent it, but we could advise against it, and have done it.

The ACTING CHAIRMAN. So that by a moral effort you expect to keep them altogether in one union—in one large federation?

Mr. VALENTINE. In a federation; yes. There have been instances where some of the unions affiliated with the department have gone on strike and we have advised and the department itself has advised against it. They have not any law that prevents them doing it; they can do it if they want to.

The ACTING CHAIRMAN. On that question of scientific management that was referred to, I should like to ask if you have had any experience with any establishment in which the so-called more modern methods of scientific management have been introduced?

Mr. VALENTINE. I do not know what you mean by "scientific management." Commissioner HARRIMAN. The efficiency system.

Mr. VALENTINE. A foundry is different from any other place.

The ACTING CHAIRMAN. I am trying to get at whether the foundry has been scientifically managed in the past or if this new issue is to come up with the foundries. Do you understand this new proposition? It involves a certain system of premium payments, bonuses, and a reorganization of the establishment generally, with a larger overhead or inspection force, and particularly a stop watch for measuring the motions and speeds of the individual. Have you had any experience with that?

Mr. VALENTINE. The average molder, if you put a stop watch on him, would go out of the foundry, or you would go out. He would not permit a stop watch over him.

The ACTING CHAIRMAN. What is the feeling against the stop watch?

Mr. VALENTINE. We consider the stop watch sort of a slave-driving proposition. That is how we feel toward that.

The ACTING CHAIRMAN. In what way?

Mr. VALENTINE. Because man has not yet become a machine. He is human; he does not want his actions gauged by a stop watch.

The ACTING CHAIRMAN. Suppose the union business agent also held a stop watch along with the boss?

Mr. VALENTINE. I never heard of such a thing. I never heard of a business agent or officer holding a stop watch.

The ACTING CHAIRMAN. When you fix the board prices so as to equalize the price of a new piece that is put in, you and the officer of the Stove Defense Association go on the ground, as I understand it, and you make a study of the amount of time that it will take to make that new piece, do you not?

Mr. VALENTINE. No.

The ACTING CHAIRMAN. How do you fix the board price?

Mr. VALENTINE. Say here is a stove bottom paying 10 cents for the molding of it. The new one has a few lugs here, or a few strips here [indicating]. We feel as though we ought to be paid for that, because it takes longer to make it, and there is more chance of it being a bad one. We get more pay for it. You must remember, in the foundry when we work piecework there are a lot of elements that enter into the making of a casting that do not have to be considered in other shops. We may make a perfect mold, and we may get a bad core to put in it. The sand may not be what it ought to be, and the mold is lost and then the man does not get paid for it. If all those things that went into the mold were controlled by the molder, it would be a different proposition; but that is not the case.

The ACTING CHAIRMAN. Suppose you found a piece here where there was no element of chance about it, and you have been paying 10 cents for that piece. We now find that the additional time required to make this new piece would make it worth 15 cents. The element of time would make a difference of 5 cents. Would there be additional elements of risk or chance of losing the piece?

Commissioner VALENTINE. Yes.

The ACTING CHAIRMAN. How do you add for that? Do you take care of that by also adding in another cent—by adding not merely 5 cents to the board price but by adding another cent and making it 6 cents or 7 cents?

Mr. VALENTINE. We might do that.

The ACTING CHAIRMAN. So that you would take two things into account—the additional time required and the additional menace or risk required. Is not that so?

Mr. VALENTINE. Oh, yes; that is right.

The ACTING CHAIRMAN. You take the two elements into consideration?

Mr. VALENTINE. There may be more than two elements.

The ACTING CHAIRMAN. But always you do take the time element, do you not?

Mr. VALENTINE. How is that?

The ACTING CHAIRMAN. You can never make a new price without taking the time element as one of the things?

Mr. VALENTINE. Sometimes we do it in one way and sometimes we do not. There may be a whole lot of elements that go into that thing. A man may take a minute longer to do that, because we do not believe human beings can work by minutes.

The ACTING CHAIRMAN. If you find that time is a factor, you will take it into account?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. If it is not a factor, you disregard it in the price?

Mr. VALENTINE. Oh, yes.

The ACTING CHAIRMAN. How do you size up the amount of time where you do take it into account?

Mr. VALENTINE. That is one of those things that could not be explained in a talk of this kind. That is the reason that we need practical men.

When we go into a factory and see the pieces before us we will argue from our own viewpoint as we see it. There may be a whole lot of reasons why we want more money, and there may be a lot of reasons why the representatives of the association do not want to pay the advance, etc. We could not explain that in a talk of this kind.

The ACTING CHAIRMAN. Do you test out the molder on the floor? Do you spend two or three days having him make that casting on the floor to see about the amount of time that it requires?

Mr. VALENTINE. We may do that.

The ACTING CHAIRMAN. When you do that the officer and the officer of the defense association observe it together, do they not?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. Then the only difference there is between you and scientific management is that neither of you has an actual standard of measurement as shown by the stop watch?

Mr. VALENTINE. Yes. You could say yes to that, but of course in saying that I want to be understood that when these differences are taken up we do not work by minutes or half minutes. We just conclude that this piece is a little larger than that, and we have a system for that. It may be a quarter of an inch larger, or it may be a half an inch larger, or possibly 2 inches larger. We try to get as nearly as we can to the question of paying an additional, say half cent, if it is 2 inches larger. If it is 2 inches larger, we may pay half a cent more for that casting. We at once increase the price half a cent. There may be another element that enters into it, and it may be increased half a cent because of that other element.

The ACTING CHAIRMAN. As I understand it, your two representatives of the two associations use their best judgment in including the additional time by observation of the men showing the additional time required, and use your best judgment as to whether there is another element, but you do not resort to actual time measurement?

Mr. VALENTINE. That is right.

The ACTING CHAIRMAN. On the other hand, you do not have an arbitrator or third man to decide in cases of difference?

Mr. VALENTINE. No, sir.

The ACTING CHAIRMAN. In establishing the piece rate?

Mr. VALENTINE. Or the day rate.

The ACTING CHAIRMAN. I assume the day rate has been made by national agreement?

Mr. VALENTINE. Yes.

The ACTING CHAIRMAN. All you are doing now is to fix this piece rate to conform to the day rate?

Mr. VALENTINE. That is right.

The ACTING CHAIRMAN. So you do not have the third party?

Mr. VALENTINE. That is right.

The ACTING CHAIRMAN. Would it be an advantage, in your experience, to have had a third party to fix on that time study?

Mr. VALENTINE. No. He would not be of any advantage to us, because of the fact, as I say, that prices in the stove shop are fixed by comparison. We have those to compare with. This bottom piece has been made for a certain price. The new bottom has some changes made in it. All that is necessary is for us to find out what those changes are. It is a comparison of one with the other. That is all there is to it.

The ACTING CHAIRMAN. Are there any further questions?

Commissioner O'CONNELL. There seems to be, in my mind, at least, brought out a situation here that is rather confusing. Prof. Commons asked you a few minutes ago about this question of a delay of ten years in the adjustment of some particular thing that occurred. That might convey—at least it does to me—that one firm would be placed at a very great disadvantage with another firm because of some delay in the adjustment of something for ten years. What I gather from your statement, Mr. Valentine, is that the question that you did not settle for five or eight or ten years would be fundamental, like the question whether the apprentice ratio should be changed from five to four, or from five to ten, and by not changing it, or if you dealt with it for ten years, no employer would have an advantage over another employer in that time. They would be working under the same ratio, no matter what is was, in that period of time; or if the question is whether a machine should be operated by a handy man or a molder or an apprentice, and if that question took a number of years to adjust, there would be no advantage to one employer, and the one employer would have no advantage over another, because it took a period of years for them to adjust that question. Is not that a fair example of the kind of question it takes so long to adjust?

Mr. VALENTINE. That is what I thought.

Commissioner O'CONNELL. There would be no advantage in favor of any employer; one employer would have no advantage over another, because it took a period of years for that to be adjusted; is that not the position with you?

Mr. VALENTINE. That is what I thought.

Commissioner O'CONNELL. The questions of wages and those things that occur daily; the question of settlement with a man as to whether he has been discharged unjustly or not; those questions are adjusted as you go along, and it does not take any great time to adjust them. As I catch your idea, that is what you want to convey?

Mr. VALENTINE. Yes; I thought that was understood; and I am glad you made mention of it, because we want it made clear.

Commissioner O'CONNELL. I think the record will probably show that if there was a question of wages on, or something that affected the employer to-day, if it took 10 years to adjust, he might be put out of business in the meantime because of the unfair position with regard to his fellow manufacturer.

Mr. VALENTINE. To show the spirit that we displayed, there is to-day an agreement of one apprentice to the shop and of one to every five journeymen. Supposing we could not furnish enough moulders and the foundrymen would need more help, our agreement provides that we can get together and determine to give those men more apprentices despite the ratio.

Commissioner O'CONNELL. The agreement which you had originally with the founders did not provide for a union shop—a closed shop, as they term it? The agreement itself had no provision of that kind, did it?

Mr. VALENTINE. The question was never brought up at all.

Commissioner O'CONNELL. The statement made here yesterday by the representative would convey the idea that that was one of the questions of unionism.

Mr. VALENTINE. It was in that discussion.

Commissioner O'CONNELL. A provision of that kind was never in the agreement at all?

Mr. VALENTINE. Not in any of the contracts.

Mr. THOMPSON. I should like to ask Mr. Valentine a question or two on the matter of arbitration and conciliation. I understand, Mr. Valentine, from what you have said that you believe in the settlement of questions between the two parties by the method which we call to-day the method of conciliation rather than that of arbitration, which required the introduction of an umpire. Am I correct?

Mr. VALENTINE. Yes.

Mr. THOMPSON. But in discussing that question the matters you touched on were matters which apparently could be delayed in their settlement from year to year, even going as far as 10 years, if I understood you correctly, so that they might be settled right and not in accordance with might.

Mr. VALENTINE. That is the point in the apprentice matter—the fundamental proposition.

Mr. THOMPSON. Yes. Now, in regard to questions of policy, the fundamental questions that both parties have to meet, I think perhaps all men would agree with you; but there are questions, are there not, that are temporary and immediate in their nature, and which would require immediate consideration? Take, for instance, a shop or a number of shops of different manufacturers, which are operated on what is called the open-shop principle, or the preferential shop principle, where the question of discrimination against a man because he is a union man may be a source of constant need of attention. A man is discharged, and he claims he is discharged because of his affiliation with the organization. On a question of that kind could you meet in a spirit of conciliation from month to month and from year to year, and while the man, perhaps, we will say theoretically is waiting for his job? There you would have to have some time limit on the adjustment of a question of that kind in those shops and under those conditions, where those questions arise more or less frequently, would you not?

Mr. VALENTINE. A man who would discharge a man because of his joining a union in an open shop, if the arbitrator were to decide that he did wrong and reinstate the man, he would repeat the dose the following week. I do not believe in this question of open shop, as understood, because I believe that these open shops mean this thing. The open shop means open to whoever the employers will permit to work in it under such conditions as the employer may establish.

Mr. THOMPSON. I have not given you the right idea of what I am trying to reach. There is no question about the open shop. That was simply an illustration of the question I want to put to your mind. I mean that where there are questions, no matter what they are, that are questions that need immediate attention, can such questions, if there is a condition in any trade where they arise constantly, be left to an adjustment which may go on for years; but in such a trade as that and in such cases as those, do you not think it would be advisable to have some form of adjustment which would provide for deciding the question, after the parties had endeavored to reach an adjustment by conciliation themselves?

Mr. VALENTINE. That might be, sir; there might be something of that kind.

Mr. THOMPSON. It would depend entirely on what the condition is.

Mr. VALENTINE. Yes.

Mr. THOMPSON. On the trade, and the nature of it, and—

Mr. VALENTINE. And the nature of the agreement, and so on.

Commissioner COMMONS. Is there anything else, Mr. Barnett, that you wish to ask?

Mr. BARNETT. No.

Commissioner COMMONS. We are very much obliged to you, Mr. Valentine.

Commissioner WEINSTOCK. Then, we will adjourn now until 2 o'clock.

Commissioner COMMONS. We will take a recess until 2 o'clock. Mr. Hogan, we regret, of course, the delay on the part of witnesses who are waiting, and we trust that you appreciate the need.

(At 1 o'clock p. m. the commission took a recess until 2 o'clock p. m.)

AFTER RECESS—2 O'CLOCK P. M.

TESTIMONY OF MR. THOMAS J. HOGAN.

Mr. BARNETT. Your address and business position, Mr. Hogan?

Mr. HOGAN. Chicago; secretary of the Stove Founders' National Defense Association.

Mr. BARNETT. When was the Stove Founders' National Defense Association organized?

Mr. HOGAN. In 1886.

Mr. BARNETT. And you had your first agreement with the molders' union in 1890?

Mr. HOGAN. 1891.

Mr. BARNETT. What was the history of the association in its relation to the molders' union from 1886 to 1891?

Mr. HOGAN. All the time fighting.

Mr. BARNETT. About what things; what were the difficulties?

Mr. HOGAN. All kinds of questions that came up, and very often on the wage question.

Mr. BARNETT. Did your association aid the members of your association in strikes?

Mr. HOGAN. Oh, yes; always.

Mr. BARNETT. And in any other way?

Mr. HOGAN. Well, no.

Mr. BARNETT. You aided them by paying them for the losses in strikes?

Mr. HOGAN. Yes.

Mr. BARNETT. And by assisting them with men?

Mr. HOGAN. Yes; both ways.

Mr. BARNETT. Did you help them by placing the work in other foundries?

Mr. HOGAN. Yes.

Mr. BARNETT. Is there any other organization of the manufacturers in the stove trade?

Mr. HOGAN. Not that I know of. I mean, in dealing with organizations, there is another organization.

Mr. BARNETT. What is the name of that other organization?

Mr. HOGAN. The National Association of Stove Manufacturers.

Mr. BARNETT. Are you an official of that organization?

Mr. HOGAN. No; not now.

Mr. BARNETT. You were?

Mr. HOGAN. Yes; I was for a number of years. I was secretary of it.

Mr. BARNETT. What are the functions of the National Stove Manufacturers? How did they differ from the defense association?

Mr. HOGAN. They look altogether after the commercial side of the business.

Mr. BARNETT. In what way do you mean—"after the commercial side of the business"? Explain a little more fully.

Mr. HOGAN. Any question that comes up in the line of freights, or questions of that kind, they get together and talk them over.

Mr. BARNETT. They talk over the question of freights?

Mr. HOGAN. That is one of the principal things.

Mr. BARNETT. Are there any other functions of the association?

Mr. HOGAN. They also talk over costs, and have issued a national association cost book, and have met on many occasions; sometimes when they want to get a change in prices, and so on, they get together and talk it over; they never agree to any advance in price, but they talk it over.

Mr. BARNETT. They get together and talk over the prices of the manufactured product?

Mr. HOGAN. Yes.

Mr. BARNETT. Do they have any officials who are engaged in the cost systems of the associations?

Mr. HOGAN. They have now; what they call their cost expert.

Mr. BARNETT. What are his functions?

Mr. HOGAN. He goes around to see the different people and looks into their costs, and very often has to show them how to get at it and how to work it out.

Mr. BARNETT. Are those associations practically coextensive in their membership, or are there members of one who are not members of the other?

Mr. HOGAN. Yes.

Mr. BARNETT. So that it is not necessary for a man to be a member of the manufacturers' association in order to be a member of the defense association?

Mr. HOGAN. No.

Mr. BARNETT. How largely does the membership overlap of the defense association and the association of manufacturers?

Mr. HOGAN. The national overlaps, probably, 20 or 25; maybe more.

Mr. BARNETT. How do you mean? Twenty or twenty-five per cent?

Mr. HOGAN. No; 20 or 25 members.

Mr. BARNETT. How many members are there of the defense association?

Mr. HOGAN. About 78 or 79.

Mr. BARNETT. And of those you mean, then, how many are members of the association of manufacturers?

Mr. HOGAN. I couldn't tell you exactly, but pretty nearly all of them are.

Mr. BARNETT. Pretty nearly all of them are?

Mr. HOGAN. Yes.

Mr. BARNETT. What do you mean by overlapping 25?

Mr. HOGAN. Twenty-five are members of the association of manufacturers.

Mr. BARNETT. And are not members of the defense association?

Mr. HOGAN. No.

Mr. BARNETT. Why are they not members of the defense association?

Mr. HOGAN. The defense association will not take in everybody; we have never solicited membership, and if a man makes application, it is looked into pretty thoroughly, and if he is in trouble with labor, and is peculiarly situated so, they will not take him in.

Mr. BARNETT. If he is at that time in trouble with labor?

Mr. HOGAN. Yes.

Mr. BARNETT. Have most of these manufacturers applied for membership in that association and been rejected, or would they like to come in?

Mr. HOGAN. I don't know whether they would like to come in, but two or three were rejected that applied.

Mr. BARNETT. On the ground that they had difficulties with labor which would make their presence undesirable?

Mr. HOGAN. Yes.

Mr. BARNETT. Are members of the association bound to the association in any way by a bond? You know that in certain employers' associations it is customary for the members to give a bond?

Mr. HOGAN. Yes.

Mr. BARNETT. Is there anything of that sort in this association?

Mr. HOGAN. No.

Mr. BARNETT. Is any member at liberty to retire when he sees fit?

Mr. HOGAN. Yes; but in becoming a member he has to pay into an emergency fund, which goes on for years, and sometimes it costs him quite a lot of money.

Mr. BARNETT. How much does it cost a man to get in? Does it depend on the number of molders?

Mr. HOGAN. Yes.

Mr. BARNETT. On how many molders?

Mr. HOGAN. \$25 or \$30 a molder.

Mr. BARNETT. Which is the largest shop in the country—how many molders?

Mr. HOGAN. Three hundred and fifty.

Mr. BARNETT. So that he would have to pay into that fund twenty-five times \$350 to come in?

Mr. HOGAN. Besides the annual dues, and also an initiation fee, which is \$50, and the dues are \$25.

Mr. BARNETT. And this emergency fund?

Mr. HOGAN. Yes; this \$25 would be his pro rata part of that.

Mr. BARNETT. \$25 would be his pro rata part of the present emergency fund?

Mr. HOGAN. Exactly.

Mr. BARNETT. And if he retires from the association he does not get anything refunded? He would lose all claim to the money?

Mr. HOGAN. The only way he can get it refunded is when he goes out of business.

Mr. BARNETT. When he goes out of business he gets his money back?

Mr. HOGAN. Yes.

Mr. BARNETT. You heard Mr. Valentine's testimony this morning as to the very successful work the conciliation agreement has done in the stove trade?

Mr. HOGAN. Yes.

Mr. BARNETT. Have you had any similar agreement with other trade unions?

Mr. HOGAN. Yes; we have

Mr. BARNETT. With what unions?

Mr. HOGAN. The metal polishers and the stove mounters.

Mr. BARNETT. Suppose we take up those separately—the metal polishers. When was that agreement formed or made?

Mr. HOGAN. I do not know. About 10 or 12 years ago, I guess.

Mr. BARNETT. With the polishers?

Mr. HOGAN. Yes.

Mr. BARNETT. 1902; is that right?

Mr. HOGAN. I might say that, but I am not sure.

Mr. BARNETT. How long did it last?

Mr. HOGAN. Four or five years.

Mr. BARNETT. Is 1909 right?

Mr. HOGAN. I think so.

Mr. BARNETT. Was it similar or identical, in its fundamental parts, with the agreement with the Stove Founders' Defense Association?

Mr. HOGAN. Yes.

Mr. BARNETT. How did it terminate?

Mr. HOGAN. Why, they withdrew from the agreement; practically abrogated that.

Mr. BARNETT. Abrogated the agreement?

Mr. HOGAN. Yes.

Mr. BARNETT. I am sorry that we will not be able to have the metal polishers at this hearing, but will you tell us why, as you understand it, they abrogated that agreement? What was their source of dissatisfaction?

Mr. HOGAN. Well, I guess they didn't want it—the agreement. They thought they would get more outside.

Mr. BARNETT. Wages?

Mr. HOGAN. Different things that came up.

Mr. BARNETT. What kind of things?

Mr. HOGAN. Shop rules and wages and various things that would come up that they would be grunting about.

Mr. BARNETT. Do you attribute this breakdown of the metal polishers' agreement to the difference in personality of the officers who had it in charge or to inherent difficulties in the trade?

Mr. HOGAN. Almost altogether to the officials. They had at this time a man who was president, who was—what do you call it—a Socialist, and he was opposed to anything of that kind. And there were quite a number of others that were Socialists in the organization, and they thought they didn't want to be bound up in any way.

Mr. BARNETT. Did not want to be tied up permanently with agreements?

Mr. HOGAN. No.

Mr. BARNETT. Did they want to have sympathetic strikes? Was that the idea, as you understand it?

Mr. HOGAN. We never had anything of that kind with any of them, because we would not make any agreements with them if there was any sympathetic strikes; that would knock out the whole thing.

Mr. BARNETT. Is there any clause in that conference agreement that precludes a sympathetic strike?

Mr. HOGAN. No; but when it was originally started that was understood, that we would not stand for anything of that kind.

Mr. BARNETT. About the mounters, stove mounters—the stove mounters' agreement was formed at that time with your association?

Mr. HOGAN. About the same time as the metal polishers.

Mr. BARNETT. 1903; a year later?

Mr. HOGAN. Yes.

Mr. BARNETT. When was that abrogated?

Mr. HOGAN. After four or five years; four years, I guess.

Mr. BARNETT. That was in 1907?

Mr. HOGAN. Yes.

Mr. BARNETT. Did the abrogation of this agreement follow any change in policy on the part of your association in any way?

Mr. HOGAN. No.

Mr. BARNETT. In 1908 your association formulated a statement of policy, did it not, at Atlantic City?

Mr. HOGAN. Yes.

Mr. BARNETT. What was the character of that statement?

Mr. HOGAN. We never paid any attention to that.

Mr. BARNETT. Will you tell us a little about that?

Mr. HOGAN. A few of the disgruntled ones—

Mr. BARNETT. What is that?

Mr. HOGAN. A few of the disgruntled ones got it through.

Mr. BARNETT. Why were they disgruntled, if you do not mind informing us?

Mr. HOGAN. They thought they would rather be away from the molders' union, and have strikes, and all that sort of thing, and run their business just as it suited them. There were quite a number of them, and they had a good deal of influence at that time.

Mr. BARNETT. Was it on account of this declaration of policies that the agreement with the mounters' union came to an end?

Mr. HOGAN. No; it was not.

Mr. BARNETT. What was the difficulty with the mounters' union?

Mr. HOGAN. Just the same as with the metal polishers. They thought they would rather be outside and not be tied by agreements, and then they could strike or have trouble whenever they wanted to.

Mr. BARNETT. Was there not a question as to the right of the mounters' union to levy a boycott on the members of the Stove Defense Association involved in the breakdown of that agreement?

Mr. HOGAN. No; the metal workers did attempt to establish a boycott, but we insisted on their quitting it, and they did. On one of our members they undertook to establish a boycott.

Mr. BARNETT. That was the polishers' union?

Mr. HOGAN. Yes.

Mr. BARNETT. Was that the reason for the breakdown of the polishers' agreement?

Mr. HOGAN. No; I do not think so.

Mr. BARNETT. That was simply an understanding in the matter?

Mr. HOGAN. Yes.

Mr. BARNETT. What was this rule about a boycott?

Mr. HOGAN. Do you mean their rule?

Mr. BARNETT. No; your rule in your "declaration of policy," or whatever it is called.

Mr. HOGAN. We had something that covered that, I think. [After examining pamphlet.] I thought we had something in regard to that, but I do not see it here now.

The ACTING CHAIRMAN. That is in the molders' agreement.

Mr. HOGAN. I thought there was another one. The molders' agreement was in 1904.

Mr. BARNETT. Just tell us the substance of it.

Mr. HOGAN. It is as follows:

"The International Molders' Union of North America shall not itself, nor by any of its agents, in any manner discriminate against the goods manufactured or sold by any member of the Stove Founders' National Defense Association because of the unwillingness of such member of said association to use the union label, and that a copy of this resolution be duly attested by the presidents and secretaries of the respective organizations, with the seal of each organization attached thereto, and a facsimile be furnished each member of the Stove Founders' National Defense Association and each local of the International Molders' Union of North America."

It was on account of the label.

Mr. BARNETT. What was the rule about the boycott, as nearly as you can remember? You can file that statement of that declaration of policy later.

Mr. HOGAN. If there is any organization that introduces a boycott, it would have to be taken off in 30 days, or else we would discontinue the agreement with them.

Mr. BARNETT. Did that mean a boycott of any member of your association who was in agreement with the union? Some of the members of your association are not under that agreement, as I understand it. Some of the members of the National Defense Association do not conduct their shops under the agreement. Is that not right?

Mr. HOGAN. Not that I know of.

Mr. BARNETT. Is it not?

Mr. HOGAN. There are two nonunion shops; that is all; but they are subject to our agreements.

Mr. BARNETT. They are subject to your agreements in what way, Mr. Hogan?

Mr. HOGAN. The same as any other members.

Mr. BARNETT. That is, as to the rate of wages fixed?

Mr. HOGAN. Yes.

Mr. BARNETT. And all these shop rules in the conference agreement are obeyed by them?

Mr. HOGAN. If they are called up, we would have to decide they would have to use them.

Mr. BARNETT. They would have to follow them?

Mr. HOGAN. Yes.

Mr. BARNETT. Suppose there is a disagreement in such a nonunion shop; how is it settled?

Mr. HOGAN. We have not had any disagreements there that we had to take up.

Mr. BARNETT. Have you not a clause in your conference agreement which provides for the settlement of disagreements in such nonunion shops?

Mr. HOGAN. I think we have; yes. Here it is. It says:

"Whenever a difficulty arises between a member of the S. F. N. D. A. whose foundry does not come under the provisions of clause 3, 1891 conference, and

the molders employed by him, and said difficulty can not be amicably settled between the member and his employees, it shall be submitted for adjudication to the presidents of the two organizations or their representatives without prejudice to the employees presenting said grievance."

Mr. BARNETT. Do you understand that to provide there shall be no suspension of work in the shop of such a member pending such adjudication?

Mr. HOGAN. There never is and never has been.

Mr. BARNETT. There has been no disagreement?

Mr. HOGAN. I mean there has never been any time when we went out—that is, in a nonunion shop—that I know of.

Mr. BARNETT. There has never been any suspension of work in a nonunion shop?

Mr. HOGAN. No.

Mr. BARNETT. So, to sum up, Mr. Hogan, you regard the breakdown of the polishers' agreement and the mounters' agreement, which were identical in structure with that of the molders, to the failure of those two unions to secure higher rates of wages?

Mr. HOGAN. No.

Mr. BARNETT. Or to the character of the—

Mr. HOGAN. The character of the people that run it.

Mr. BARNETT. But, as a matter of fact, they did not secure rates of wages?

Mr. HOGAN. Yes, sir.

Mr. BARNETT. An advance in rates of wages?

Mr. HOGAN. Yes, sir; they did receive advances.

Mr. BARNETT. Did they receive advances of as much as the molders received?

Mr. HOGAN. About the same.

Mr. BARNETT. Has there ever been any difficulty, Mr. Hogan, to go for a moment to the agreement with the molders, settling, through yourself and through the representative of the molders' union, differences in the shops? Have such difficulties been delayed in any considerable length of time in settlement?

Mr. HOGAN. It has never happened more than twice anyway, and only once in my time.

Mr. BARNETT. How long a delay intervened?

Mr. HOGAN. It was referred to the conference committee and by them taken up, and it was decided against our member and he almost immediately resigned.

Mr. BARNETT. How long does it ordinarily take for a shop difficulty to be settled by you and a representative of the molders' union?

Mr. HOGAN. Just as soon as we get there.

Mr. BARNETT. I suppose you can not get there sometimes for some little while?

Mr. HOGAN. Oh, no. Sometimes it takes four or five or six months that might go by, but they have to go on working, and when it is settled they get it from the time it was first applied for.

Mr. BARNETT. You have never had any strike during this time on account of the impatience of the men?

Mr. HOGAN. Not with the molders.

Mr. BARNETT. Did you have with the mounters or polishers?

Mr. HOGAN. Yes; we did with the mounters; we never did with the polishers.

Mr. BARNETT. During the time when the grievance was filed and before the settlement could be made, the mounters went on a strike?

Mr. HOGAN. Yes. But that was after they had determined their agreements. They made demands and our people would not accede to them, and then they had a strike, and we supported the members.

Mr. BARNETT. Are there any machines used in stove foundries?

Mr. HOGAN. Yes; quite a number.

Mr. BARNETT. What kind of machines?

Mr. HOGAN. Molding machines.

Mr. BARNETT. Is there any particular type of machine used in the stove foundries?

Mr. HOGAN. Yes; but I can not call the names of them now.

Mr. BARNETT. How many of those machines operated at the present time—by molders?

Mr. HOGAN. In a few cases; that is all. There has no settlement been made in the way of pricing this kind of work, and most of them are operated by apprentices.

Mr. BARNETT. Are any of them operated by handymen?

Mr. HOGAN. Very few, I think; if there is any. I do not know.

Mr. BARNETT. Would that be objected to? Has there ever been any objection to that on the part of the molders' union?

Mr. HOGAN. No. The only thing is, of course, where we put them on that way we call them apprentices.

Mr. BARNETT. At the present time the understanding is that in the absence of any conference agreement on any particular question, the matter shall be left open—that is, the employer shall be allowed to use his own discretion—until such time as an agreement is reached, is it not?

Mr. HOGAN. I do not know that it is exactly that way. There is no change that can be made in shop rules, without both parties are agreeable to it; that is, the firm and its men.

Mr. BARNETT. Is there any national shop rule at the present time in the molders' union, so far as you know, with reference to the use of a handy man on machinery?

Mr. HOGAN. Not that I know of; no.

Mr. BARNETT. Are there rules in the local union?

Mr. HOGAN. No.

Mr. BARNETT. That is, there is no objection on the part of the local unions to the use of a handy man on a machine?

Mr. HOGAN. None; if they are ruled as apprentices or put in as apprentices.

Mr. BARNETT. So that at the present time practically all the shop rules—and I mean by shop rules the rules which affect the conduct of the industry in any way—are settled entirely by joint agreement between the molders and the national association?

Mr. HOGAN. No; in regard to the shop rules or conditions in the shop, that is taken up between the firm's own men and themselves.

Mr. BARNETT. I did not mean shop rules in that sense. I am using the term "shop rules" in the sense of any rule of a union which affects the conduct of the industry, such, for example, as the apprenticeship rule, the rule about the use of machines, or any rule of that kind.

Mr. HOGAN. No; we are not affected in that way.

Mr. BARNETT. Do you have any difficulties with the local unions imposing rules which are at variance with the conference agreements?

Mr. HOGAN. Sometimes; yes.

Mr. BARNETT. In what way? Will you illustrate that?

Mr. HOGAN. They want something done that is in opposition to the conference agreement and they go out of their own accord. We immediately notify the president, Mr. Valentine, and he looks after it that they get back to work. If they have any grievance it has to be taken up in regular form.

Mr. BARNETT. It is an understood thing between your association and the officers of the national union that local unions can not impose shop rules of their own origination? That power of legislation is taken out of their hands?

Mr. HOGAN. They certainly can not.

Mr. BARNETT. What are the kinds of grievances which you and the representative of the molders' union take up? What are the kinds of grievances which you have to settle chiefly?

Mr. HOGAN. You might say most all kinds of grievances come up during the year, but generally settling the prices for new work going in.

Mr. BARNETT. That is, that the employer and the committee can not settle in the matter of price?

Mr. HOGAN. Yes.

Mr. BARNETT. You never have questions come up with reference to whether or not a man is a union man?

Mr. HOGAN. Very seldom. We have had one or two cases, but the men were left there at work.

Mr. BARNETT. What is the understanding about that?

Mr. HOGAN. There is no understanding.

Mr. BARNETT. What was the character of the decision?

Mr. HOGAN. It was simply some kind of work that was needed very badly and there was no man in the shop that could do it, and they got a man that could make it, and he was a nonunion man and he was allowed to work.

Mr. BARNETT. Are there outstanding issues at the present time between your organization and the molders' union?

Mr. HOGAN. No. The only thing is the settling of the pricing of molding machines.

Mr. BARNETT. And that is, as Mr. Valentine described it this morning, a question as to the number that shall be made?

Mr. HOGAN. It is supposed to be settled that way, according to the product or the amount that a man can get out on it. But, as they say, a man has to work harder if they urge him to put up all he can, and of course it makes it harder to pour it off, because, as he says, when one man is putting up 100 and another man 200, the 200 takes more iron than the 100.

Mr. BARNETT. Do you know whether the use of machines is relatively less or greater in the shops of the members of your association or in the shops of the National Founders' Association?

Mr. HOGAN. I think they are more in the National Founders' Association, because they have a greater number and there is a greater variety of business.

Mr. BARNETT. That is because of the difference in the character of the work?

Mr. HOGAN. Yes.

Mr. BARNETT. Stove molding as yet has not become much of a machine industry; it is chiefly a hand industry?

Mr. HOGAN. They are coming to it more and more all the time. Our members are increasing the number of machines they are putting in.

Mr. BARNETT. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. O'Connell, have you any questions?

Commissioner O'CONNELL. I just want to ask about the polishers and mounters. They are still employed in your shop, are they not?

Mr. HOGAN. Yes; and we take up their grievances and adjust the cases.

Commissioner O'CONNELL. You take up their grievances and adjust them as you did before the agreement was abrogated?

Mr. HOGAN. Yes.

Commissioner O'CONNELL. The understanding is just the same as it was before, except their general agreement has been abrogated?

Mr. HOGAN. I have always taken it up with them.

Commissioner O'CONNELL. And you meet their officers just as you did before?

Mr. HOGAN. Yes.

Commissioner O'CONNELL. I recall having seen you and the president of the metal polishers in St. Louis not long ago.

Mr. HOGAN. Yes; both of those organizations have asked us to renew the agreements again, but I do not think our people will do it.

Commissioner O'CONNELL. That is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Lennon?

Commissioner LENNON. I would like to ask one question that may not be clear. In the matter of putting apprentices on machines you are limited to the number of apprentices allowed to the journeymen, the same as provided by the rule set forth by Mr. Valentine?

Mr. HOGAN. Yes.

Commissioner LENNON. If you put in 20 machines, you would not put in 20 apprentices if there were only 5 allowed under the agreement?

Mr. HOGAN. Oh, no.

The ACTING CHAIRMAN. Mr. Ballard?

Commissioner BALLARD. You said you had no suspension of work in nonunion shops. Was there any suspension of work in union shops?

Mr. HOGAN. No; except in a few cases where the men would go out locally and be out for a few days; that is all. That has been kept up in very good shape.

Commissioner BALLARD. You said sometimes you put on an extra man or two to do extra work the men in your shop were not prepared to do. Are those men required to take out union cards?

Mr. HOGAN. No.

Commissioner BALLARD. That is all.

The ACTING CHAIRMAN. Mr. Delano?

Commissioner DELANO. Mr. Hogan, you have heard the testimony yesterday and to-day on this question?

Mr. HOGAN. A good deal of it, I guess.

Commissioner DELANO. It developed in that testimony that as between the association of stove makers and the molders' association the trade agreement had worked out satisfactorily, whereas as between the general foundry men and the molders' union the trade agreement has not worked out. Will you explain the reason for that or give your own reason?

Mr. HOGAN. With the foundry men's association, they never wanted to agree with the molders—that is, since 1904 or 1907, I do not remember which it was,

when Mr. Briggs was a member. I never knew them to agree to anything after that. They were entirely opposed to it.

Commissioner DELANO. Even that does not explain why the trade agreement has worked in one case and not in another, because there was a trade agreement between the foundry men and the union which had been in effect for five years or seven years and was then abrogated.

Mr. HOGAN. When they originally started they took it from our agreements, and as long as they kept that up they seemed to get along all right.

Commissioner DELANO. I think you testified there were something like 78 manufacturers in your association?

Mr. HOGAN. Yes.

Commissioner DELANO. As I recall it, testimony was given yesterday that there are something like 6,000—not in the foundry men's association—but 6,000 employers in the general foundry business of the country. Is that approximately correct?

Mr. HOGAN. I do not know anything about the foundry men. In the stove industry there are about 230 or 240. Our members make about 75 or 80 per cent of the product—75 per cent anyway.

Commissioner DELANO. What I want to find out, if you can tell us, is why the trade agreement was successful in one case and not in another. I assume—I do not know whether correctly or not—that the character of the men or the employers in each case is very much the same. I do not imagine the men that are engaged in the foundry business of the country differ materially from the men engaged in stove manufacturing.

Mr. HOGAN. The stove manufacturers have been educated up to that standard, that is to try to get along with their men and try to reach agreements with them. You see, we were about the first manufacturers' organization to treat with organized labor, and we started in 1886, and it was in 1891 that we first got together on conference agreements. But, as Mr. Valentine stated this morning, on our side we had some people who thoroughly understood all the parts of the molding, and all that kind of thing, and who were molders themselves, and of course it made it easier for them to understand anything the molders were driving at or driving for. I was on the first conference that they ever held, and there were two others on there that had worked at molding. I have worked at molding; I learned the trade.

Commissioner DELANO. Mr. Hogan, was the fact that the employers were more compact and better organized a fact that had anything to do with it?

Mr. HOGAN. No; I think they understood the situation of the workingman a good deal better. In the other organization there might be some there that had started in on the floor, but still they were not connected with the executive part of it. Of course, I do not know much about the other association. I can not say anything for it any more than just what I said—that I never thought they did want to agree with them after the first five years, when they had those agreements.

Commissioner DELANO. I think that is all, Mr. Chairman.

The ACTING CHAIRMAN. Mr. Weinstock?

Commissioner WEINSTOCK. You have explained, Mr. Hogan, that there were two unions, I think, who did not renew their agreements with your association on the ground that they could do better without agreements than with agreements.

Mr. HOGAN. That is the way they talked.

Commissioner WEINSTOCK. Would that indicate then that trade agreements are not always mutually advantageous?

Mr. HOGAN. They talked that way, but since the agreements went out, they never got anything unless it is what they got in individual cases. They never have come up as do these other questions annually, and we never get any advance from them except a demand here and a demand there. Those we have taken up with them and straightened out. During the past year we have met with both those organizations, the metal workers and the stove mounters, probably 10 or 12 demands from each one of them, and we have taken them up. They demanded an advance of about 12½ or 15 per cent. None of them got it.

We took it up with them and satisfied them that they could not get it, and they let it go at that.

Commissioner WEINSTOCK. How many different kinds of union does your association deal with?

Mr. HOGAN. Well, we deal with the molders' union and with the stove mounters and also the metal polishers.

Commissioner WEINSTOCK. Three unions?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. And out of the three you have agreements with one and have no agreement with the remaining two?

Mr. HOGAN. We did have agreements with the other two.

Commissioner WEINSTOCK. How many strikes have your people had in the last 10 years that you can remember?

Mr. HOGAN. With the molders, none in 24 years. With the stove mounters we have had one; there might have been 15 or 20 concerns affected by it.

Commissioner WEINSTOCK. What was the duration of the strike?

Mr. HOGAN. The men have never come back to work since, and they have other men working there. They kept right along.

Commissioner WEINSTOCK. They lost the strike?

Mr. HOGAN. They lost the strike.

Commissioner WEINSTOCK. What was the cause of it?

Mr. HOGAN. I think it was a demand for more wages; I think so.

Commissioner WEINSTOCK. The other unions did not strike in sympathy?

Mr. HOGAN. No; we have never had any sympathy strikes.

Commissioner WEINSTOCK. Have any of your members introduced into their plants the so-called efficiency system?

Mr. HOGAN. Not that I know of.

Commissioner WEINSTOCK. Not any of them?

Mr. HOGAN. I do not know of any of them. Maybe one or two of them tried it; but I don't believe it ever worked.

Commissioner WEINSTOCK. What, as an employer, have you found to be the advantages and disadvantages of dealing with organized labor?

Mr. HOGAN. Well, I have found it very advantageous for the stove manufacturer.

Commissioner WEINSTOCK. In what way? Please explain what the nature of the advantages is.

Mr. HOGAN. In the first place, they have had, since they started making these agreements, they have had no strikes. That is one great thing, and they have always managed to make agreements with these men and have them carried out. I might say that we have had demands made on us by the molders' union for from 15 to 20 different things there, and in 24 years we have agreed on 28 propositions out of—well, you might say 3,000—I should say about 3,000 demands that were made.

Commissioner WEINSTOCK. You say, then, that the chief advantage in dealing with unions is due to the fact that you have had industrial peace?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. Now, what, if any, have been the disadvantages?

Mr. HOGAN. Well, I do not know. I would not say there were any.

Commissioner WEINSTOCK. No disadvantages?

Mr. HOGAN. No; because—well, there were sometimes, of course, when men did things that we claim are in violation of the agreement; but they are all straightened out very soon.

Commissioner WEINSTOCK. As a matter of choice, would you rather see the unions remain in existence, or be wiped out?

Mr. HOGAN. I would rather see them in existence; if I was running a factory of my own, I would not have anything else; not while I was a member of the defense association.

Commissioner WEINSTOCK. That is, you would rather do collective bargaining rather than do individual bargaining?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. Do you get higher efficiency from members of the union than you do from the average nonunion man?

Mr. HOGAN. No question about it.

Commissioner WEINSTOCK. You do get higher efficiency?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. That is, the union men as a rule represent the higher skilled workers?

Mr. HOGAN. Yes. I have had some men from the other side, and I have always found the union men the best men. Of course they have to learn the trade, and they become good men. Then, of course, there are men that are not good, not steady workers, or drink, and one thing and another, but, of course, we do not bother with them very much.

Commissioner WEINSTOCK. It will be interesting for the records of the commission, Mr. Hogan, if you would tell us whether your association has met with any of the difficulties that seemingly were met by the association represented by Mr. Briggs. He said that his association was unable to get the unions to arbitrate with him. Have you had any difficulties along those lines?

Mr. HOGAN. Well, on that arbitration question, in our agreement it says that all matters will be taken up by arbitration. I was on that first conference committee when that first question was brought up, and at that time we did not know very much about conciliation, or anything of that kind, and it was distinctly understood at that time that the arbitration met, and there would be the same number on each side, and they had to get together and agree, and if they did not, there would be trouble; and there has been not more than two or three cases where it has been brought up that way.

Commissioner WEINSTOCK. I take it, then, that you do not agree with Mr. Briggs in his statement that he believes that individual bargaining will obtain more for the worker and a better wage than collective bargaining?

Mr. HOGAN. I never knew it to happen; always when they made individual agreements they always tried to get them just as low as they could.

Commissioner WEINSTOCK. The statement was also made that his experience was that the unions did not come to the employer in a conciliatory spirit, but that they came demanding the limitation of apprentices and the nonintroduction of machinery, and a closed shop, etc.

Mr. HOGAN. I have never known them to make demands of that kind; that is, the international unions. That might be made by locals, but still we have not had anything of that kind.

Commissioner WEINSTOCK. What has been the spirit of the unions in meeting you?

Mr. HOGAN. With us it has always been friendly.

Commissioner WEINSTOCK. And conciliatory?

Mr. HOGAN. Yes. You see, we started with them in 1891, and they never got anything much out of us until 1899. That was when we made the first advance to them, the year 1899. There we had been running nine years, and during that time we had taken up the question with them of equalizing the prices throughout the country, and we did that pretty thoroughly.

Commissioner WEINSTOCK. Equalizing your selling prices?

Mr. HOGAN. No.

Commissioner WEINSTOCK. Wages?

Mr. HOGAN. The base price of the wages; what they call the board prices. To-day in the stove business there is very little difference between one section and another, so far as the board prices are concerned.

Commissioner WEINSTOCK. They have been equalized?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. What are the present relations between the workers and the employers?

Mr. HOGAN. Excellent.

Commissioner WEINSTOCK. Are the relations cordial or hostile?

Mr. HOGAN. Cordial.

Commissioner WEINSTOCK. The relations between the two are cordial and friendly?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. Mr. Briggs stated that he found that the most difficult problem to solve was that of apprentices. What has been your experience in that connection?

Mr. HOGAN. Well, you know when we started the agreement with the molders the ratio was 1 to 8, and we have from time to time wanted them to change that to 1 to 4, and they always objected to it, and when we started these agreements there were quite a number of our members who were running what they called open shops; that is, a good many of their workmen were nonunion men, but gradually these agreements brought them out, so that a man joined the union, and up to—well, for the last 10 years, we have only two concerns that are running nonunion.

Commissioner WEINSTOCK. If you were here, you probably heard Mr. Briggs say that with the number of apprentices allowed in the molders' union, the molders would be almost extinct; almost an extinct species in 20 years. What is your opinion of that?

Mr. HOGAN. I do not believe it, in any sense.

Commissioner WEINSTOCK. You think you are recruiting enough to replace the men that drop out?

Mr. HOGAN. The 1 to 5 brings them up all right, I think.

Commissioner WEINSTOCK. You have no fear, then, of the species becoming extinct?

Mr. HOGAN. No.

Commissioner WEINSTOCK. Mr. Briggs also gave it as his experience that on the introduction of a machine to make pulleys, the union men made but three a day, while a nonunion man made seven a day at the start, and averaged later nine a day.

Mr. HOGAN. I think that may be true, and the reason for that is this, that the molders were very much opposed to the machinery; in fact, as I say, we used mostly apprentices for the last eight years, and the molders were very much opposed to it; and not only that, but I think their international officers were a little bit against it. But from time to time they began to see that the machines were something that had come to stay, and they finally—

Commissioner WEINSTOCK. Reconciled themselves?

Mr. HOGAN. Yes; they thought that they would fall in line, but we have not settled that thing yet.

Commissioner WEINSTOCK. Now, does the molders' union, or any of the other unions that you operate with, stand for a diminishing output?

Mr. HOGAN. Well, yes; I think the metal workers do. That is about all, now.

Commissioner WEINSTOCK. They put restrictions on the output of each man?

Mr. HOGAN. Yes; of their own men.

Commissioner WEINSTOCK. They must not produce more than a certain quantity in a day?

Mr. HOGAN. They say, "Here, the limit here is four hours, and the limit there is four and a half hours," and so on; and they keep that up pretty well. I was talking with Mr. Daley, who is the president—

Commissioner WEINSTOCK. I do not mean a minimum wage, but the output.

Mr. HOGAN. That is the way they make it.

Commissioner WEINSTOCK. Where they are operating on piecework?

Mr. HOGAN. Yes; pretty nearly everything is piecework.

Commissioner WEINSTOCK. And they provide that they must not aim to earn more than \$4 a day?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. If he exceeds the amount what do they do to him?

Mr. HOGAN. They discipline him, I suppose.

Commissioner WEINSTOCK. They discipline him?

Mr. HOGAN. Yes; and where they run over that, they say to the foreman, "Keep that back until some other time," and get us in that way.

Commissioner WEINSTOCK. Is that conducive to the best results?

Mr. HOGAN. No, sir.

Commissioner WEINSTOCK. You do not think so?

Mr. HOGAN. No, sir; I am opposed to it.

Commissioner WEINSTOCK. You offer that as a criticism against the molders?

Mr. HOGAN. Yes, sir; but we do not do that with the molders. I think at one time they had it with the molders, but it was dropped.

Commissioner WEINSTOCK. This is only the metal polishers that put a maximum limit on the output?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. You think that is disadvantageous to the man, and disadvantageous to the employer?

Mr. HOGAN. Very much so.

Commissioner WEINSTOCK. You feel that there ought to be no bar to the amount of earnings that a man can make?

Mr. HOGAN. I feel that way. I always did.

Commissioner WEINSTOCK. Mr. Briggs pointed out that the founders in his association have had much better success during the last 10 years, since the abrogation of the New York agreement.

Mr. HOGAN. Of course, I do not know anything about that. That is a question. He has had lots of strikes, I think, that he never had before. I never saw a strike that would help anybody.

Commissioner WEINSTOCK. You think they should be avoided in every possible way?

Mr. HOGAN. Yes; I have been through that. I was for 26 years a manufacturer myself.

Commissioner WEINSTOCK. Mr. Briggs, as you may remember, also gave it as his opinion that the trade agreement is not conducive to industrial peace in the metal trades.

Mr. HOGAN. It depends altogether how they are carried out. If you are looking for something that is entirely different, and that is against the ideas of your workmen, of course, it may turn out bad. The way we do, anything we want, any change we want, we take it up with them and we keep going at them until we get it or until it is settled.

Commissioner WEINSTOCK. Apparently the experience of your association, then, has been diametrically opposite to the experience of Mr. Briggs's association?

Mr. HOGAN. I think so.

Commissioner WEINSTOCK. His experience has been that agreements led to conflict, and were not conducive to the best results, did not lead to bettering the condition of the workers, and hampered the employers.

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. Your experience has been exactly the opposite of that?

Mr. HOGAN. Exactly the opposite.

Commissioner WEINSTOCK. That it has been conducive to industrial peace, that it has raised the standard, that it has brought about a more cordial and more kindly and friendly feeling between the employees and employer?

Mr. HOGAN. Yes; absolutely.

Commissioner WEINSTOCK. And as a choice, if you could abrogate the unions, you would not do it?

Mr. HOGAN. Yes.

Commissioner WEINSTOCK. That is all.

Mr. HOGAN. I have been working with them in the stove business, and I have been in it 47 years.

Commissioner COMMONS. You spoke, I think, about one or two local strikes of the molders. Is that all that occurred, during your recollection, in the 24 years—I mean shop strikes of one or two or three days?

Mr. HOGAN. No; there were no strikes.

Commissioner COMMONS. What is that?

Mr. HOGAN. There were no strikes at all.

Commissioner COMMONS. I think possibly you called them cessations.

Mr. HOGAN. No; it was practically a violation of our agreement, because the agreement says they shall not go out, no matter what the complaint is, and we can not shut up the shop; but once in a while the men get hot-headed, and they think they are asking for something they ought to get, and they do not get it and they go out; but it does not last more than a few days, because we immediately notify Mr. Valentine and he looks after it and they come back to work. That is all. It just makes a little trouble for a few days.

Commissioner COMMONS. Ordinarily that would be called a strike?

Mr. HOGAN. No, sir.

Commissioner COMMONS. Not a violation of the agreement?

Mr. HOGAN. No, sir.

Commissioner COMMONS. What?

Mr. HOGAN. It might be if we did not have the agreement; or if we did not have the association it might be called a strike.

Commissioner COMMONS. Your distinction, then, seems to be that as long as the national union orders them back it is not a strike.

Mr. HOGAN. It is not a strike; certainly not.

Commissioner COMMONS. Could you give us from your records, or are your records such that you could furnish us, a list of these strikes—these cessations—and their continuance?

Mr. HOGAN. When we go and settle them we always write out just what they shall do, but we never give a list to anybody.

Commissioner COMMONS. Then you would not, on request from this commission, feel like furnishing it?

Mr. HOGAN. No. It would not do you any good, and it is against our rules.

Commissioner COMMONS. What kind of statistics might we expect from you if we requested something further to help out our formulation?

Mr. HOGAN. I do not know of anything I could give you. If there was something you wanted particularly, and you would write me about it, I would try and

see if I could get it for you; but we do not give out any of our statistics at all, not even to our members.

Commissioner COMMONS. Is there any particular reason for that policy?

Mr. HOGAN. Well, yes; there have been times when our members objected very much. If they happened to have trouble with one department, or anything of that kind, and it was reported to the members, they immediately sent in a kick.

Commissioner COMMONS. A kick because the settlement was not—

Mr. HOGAN. No; because they did not want it mentioned.

Commissioner COMMONS. The member who had the trouble did not want it mentioned?

Mr. HOGAN. Yes. In fact, there was one case, I think, where the member—quite a prominent member—resigned. They afterwards came back, but they resigned at the time it was published that they had trouble with one of their departments.

Commissioner COMMONS. From their standpoint, why do they not like to have that published?

Mr. HOGAN. That is one of the reasons.

Commissioner COMMONS. They do not want it known that they have trouble?

Mr. HOGAN. They do not want it known that they have got trouble. They know that it will be fixed up very soon, and there is no need of publishing it.

Commissioner COMMONS. Did the molders' union, or the members of the molders' union, formerly place a limit on the amount of earnings that a man could make?

Mr. HOGAN. Did they what?

Commissioner COMMONS. Did they formerly have a limit on the amount of earnings?

Mr. HOGAN. No; I never knew it, only in a few instances where they claimed that they had a limit, and we asked to have it taken off, and it was taken off right away. I do not think it was ever done by the international union.

Commissioner COMMONS. It was done by local unions?

Mr. HOGAN. I suppose so.

Commissioner COMMONS. And they would place a limit on what a man might earn, of only four or five dollars—four dollars?

Mr. HOGAN. Yes.

Commissioner COMMONS. What reason have you for believing that such local limits are not maintained at the present time?

Mr. HOGAN. Well, I generally hear of anything of that kind.

Commissioner COMMONS. What is that?

Mr. HOGAN. If there is a limit anywhere, I hear of it.

Commissioner COMMONS. Do you have a minimum day wage on the basis of piece rates at all?

Mr. HOGAN. Well, no; the day rates are different in different places.

Commissioner COMMONS. Suppose a man is altogether on a piece job; do you guarantee that he will earn a minimum wage for the day?

Mr. HOGAN. No, sir.

Commissioner COMMONS. That is, it is not a premium?

Mr. HOGAN. We may take a man that is on piecework and put him on day-work, and if his job that he has been working on is greater than the day wage, he gets the price that he earned on his floor; that is, for a few days, just temporarily.

Commissioner COMMONS. There is no such thing, then, as a guarantee of a man getting any minimum wage?

Mr. HOGAN. No.

Commissioner COMMONS. Each man earns just what he can?

Mr. HOGAN. Yes.

Commissioner COMMONS. Then if a man is earning less than what you consider a competent man should earn, an old man, or a slow man, or anything of that kind, do you discharge him?

Mr. HOGAN. No.

Commissioner COMMONS. You have the right to discharge him?

Mr. HOGAN. We have, if we want to; but we do not. A man that is that way is usually a man that has been working in the shop for a long time. They do not employ any old men when they want men, and they may be men that get old in working for them. There have been cases where the firm has put those men on a pension; just simply put them on the list and paid them about what they could earn, and all they had to do was to come and draw their pay. That has been done.

Commissioner COMMONS. It seems that the molders' union has no limit on the earnings. Will you state how much, then, molders do actually earn in a day's work, of eight hours, I think it is?

Mr. HOGAN. No; they work about nine hours?

Commissioner COMMONS. Nine hours?

Mr. HOGAN. Some of them make seven and eight dollars a day.

Commissioner COMMONS. What would you say is the lower limit?

Mr. HOGAN. The average taken last fall was \$4.24, in the whole association.

Commissioner COMMONS. Can you give the number who earn less than the average of \$4.24?

Mr. HOGAN. No; I could not do that now.

Commissioner COMMONS. Could you furnish that kind of information to us if we requested it?

Mr. HOGAN. No; I could not. I will tell you why. That information was got up just for our conference, and after that it was done away with. We can not keep those things, only just for the time, to use them. We get this information from the members, and they do not want it given away, and they do not want it to be on record.

Commissioner COMMONS. Suppose we should simply ask it in such a way that the identity of the individual members should not be known; could it not be given? For instance, that 10 per cent are earning \$2, and 10 per cent are earning \$4, and so on. Could we get such information?

Mr. HOGAN. I do not think you could.

Commissioner COMMONS. How does the union assist you in doing away with these local restrictions on output?

Mr. HOGAN. Well, they just simply order them that they should not do it; that is all. Where it was done, they just told them that they must stop it, and they did.

Commissioner COMMONS. They follow their orders?

Mr. HOGAN. Yes.

Commissioner COMMONS. I believe Mr. Valentine stated that the union would decline to work with a man who refused to pay the union dues.

Mr. HOGAN. I never knew that to occur.

Commissioner COMMONS. Have you known of any strikes by local unions to force a man to quit work?

Mr. HOGAN. No.

Commissioner COMMONS. Or to pay the dues?

Mr. HOGAN. No; I never knew of anything of that kind.

Commissioner COMMONS. Then, so far as you know, the pressure that they bring on a man to join the union after he has been employed is simply outside of their ability to strike and force him to join? It is simply a moral force that they bring to bear?

Mr. HOGAN. A man generally pays; that is all there is about it.

Commissioner COMMONS. Have you any reason to think that men who join under those circumstances, who have been taken on as nonunion men, object to joining the union?

Mr. HOGAN. I could not say. We have never had anything of that kind, so I could not say.

Commissioner COMMONS. You have no knowledge of any employer coming to you and trying to protect one of his nonunion men against joining the union?

Mr. HOGAN. No, sir.

Commissioner COMMONS. We are very much obliged to you, Mr. Hogan.

TESTIMONY OF MR. JOHN P. FREY.

Mr. THOMPSON. Will you please give the reporter your name, residence, and occupation?

Mr. FREY. John P. Frey; Cincinnati, Ohio. I am one of the executive officers of the International Molders' Union, and I am editor of their official publication in addition.

Mr. THOMPSON. How long have you had that position?

Mr. FREY. I have been editor of that publication since 1903; from the beginning of 1900 to 1903 I was one of the vice presidents.

Mr. THOMPSON. Are you acquainted with the relations which the union has had with the Stove Polishers' Association?

Mr. FREY. Mr. Thompson, before answering that, there are two matters that I should like to call attention to, to get them in the record, for fear they will be passed over.

Mr. THOMPSON. Very well.

Mr. FREY. May I proceed?

Mr. THOMPSON. Yes.

Mr. FREY. This morning a statement was made relative to its taking 10 years or more to adjust the question of an apprentice ratio with the defense association, and there may have been an erroneous impression left, as a result of the reply. It is true that it took over 10 years to reach that agreement, but during that period whenever a member of the defense association found that he had insufficient apprentices in his foundry to meet his demands, the question was taken up by one of our officers, and by Mr. Hogan, and adjusted. That is, in individual cases the matter received attention, but it required over 10 years to secure a national agreement on the question.

The other matter is this: In the hearing yesterday afternoon I understood that a request was made, or permission was granted, to the National Founders' Association to introduce a statement covering all of the strikes which have occurred on the part of our members in the foundries operated by members of the defense association, and giving the reasons. I feel that if, for the information of the commission, data of that kind are supplied by the National Founders' Association, a copy, as soon as the commission receives it, should be forwarded to the International Molders' Union, so that we would be able to file our statement. I say that for this reason: I have seen a number of statements relative to the causes of our strikes issued by the National Founders' Association, and through lack of competent investigation, the reasons they gave for our striking were at variance with the actual reasons, and I presume that the commission will recognize the fact that nobody would know why we struck better than ourselves. I say that so that the record may be straight.

Commissioner COMMONS. In general, Mr. Frey, the commission would be glad if you would furnish a record of all these strikes from your own records, and then the commission will see to it, of course, that each side is properly safeguarded.

Mr. FREY. I just wanted to speak of that first.

Commissioner COMMONS. We would like to have yours, independently of whether they send theirs or not.

Mr. FREY. It would be a difficult matter, because we have had strikes in foundries operated by manufacturers who were members of the defense association, and some who were not members of the defense association, and we would have trouble to know which of these the commission is interested in.

Commissioner COMMONS. All this commission is interested in is strikes in the foundries of those who are members of the association. If you will give us a list of all the strikes in the industry—possibly it is a matter of official record already, but we should like to have it, if it is not too much work for you, from your office.

Mr. FREY. We may be able to prepare such a statement.

Commissioner COMMONS. We make the request of you, and we should be glad to have it.

Mr. THOMPSON. I will state again the question which I asked you: From your official position, are you acquainted with the relationships that existed between the union and the stove founders' association?

Mr. FREY. To a certain extent; yes.

Mr. THOMPSON. Are you also acquainted with the relationship that existed between the union and the National Founders' Association?

Mr. FREY. I had a personal contact with the question for four years.

Mr. THOMPSON. Are you able to state the reasons why the agreement with the one is maintained, and why the agreement with the other association broke down?

Mr. FREY. I may not be able to state the reason. I can give you my opinion.

Mr. THOMPSON. I should like to have your opinion with reference to both of those questions.

Mr. FREY. In a general way, I would say that the reason was not in the character of the foundry men, members of both associations, but rather in their policy; the attitude of their officers and their members toward the question of unionism; the willingness of one to allow education to do its work when problems of a general character arose, and the desire of the other to enforce the desire of their members; further, the willingness of the members of one association to assist in equalizing wages to a certain extent by districts, and the hesitancy or the unwillingness of the other to assist us in an effort to bring

wages in a district to a normally equal basis; the indifference of the members of one association toward the question of unionism in their foundries, and the active opposition of a number of the members of the other association to any union in their plant; the taking up of questions and endeavoring to reach a solution through a discussion of the merits of the principles involved, and the efforts of the other organization to build up machinery which would make trade agreements unnecessary, because the machinery of their organization would have to put the International Molders' Union and its local unions in the discard.

Mr. THOMPSON. You might state, Mr. Frey, more in detail the working of the two associations with reference to the question of wage scales, which you have mentioned as preventing the working of the agreement.

Mr. FREY. As has been testified to by Mr. Hogan and Mr. Valentine, wages in the stove foundries depend upon what you call the board price, or basic price—the price of the pattern—which is presumed to be the same in the same districts, except for such variations as there may be in the form of the patterns, and then the percentage in wages, which is reached through the international conference, that percentage being equal throughout the United States. At the present time it is 35 cents on the dollar; that is, the molders' earnings are computed on the piece, his board price or base price, and 35 per cent is then added to the base price; it means that, no matter where the stove molder goes, he is assured of practically the same rate of wages.

We had no such agreement or any such system to arrive at a wage rate with the National Founders' Association, and the wages in the jobbing and machinery foundries varied very considerably in near competitive points. Those cities that might be from 50 to 100 miles apart would have a difference of rate, in some instances 50 to 75 cents a day in the minimum. It was our effort to raise the wages in what we call these low-wage districts more rapidly than in the centers where the wage rate was higher, but we experienced considerable difficulty, because the officers of the National Founders' Association opposed our efforts to secure an advance in the minimum wage rate in the low-wage districts, seemingly, to us, as energetically as they had when they tried to secure an advance in wages in the districts paying higher rates.

Mr. THOMPSON. What is your opinion as to the varying character of the businesses of these two associations as affecting this question of settling on a wage scale?

Mr. FREY. I do not quite get that?

Mr. THOMPSON. You understand in the stove business it is principally stove work, of course?

Mr. FREY. Yes.

Mr. THOMPSON. Now, with reference to the National Founders' Association, it has been stated here that they have work all the way from casting watch charms, which weigh a trifling number of ounces, to pieces that weigh over 20 tons? Does the character of that business interfere with or prevent the making of a wage scale such as you have in the stove business?

Mr. FREY. I believe that it does; but in the majority of the jobbing and machinery foundries the day wage scale prevails. Members of the National Founders' Association contended for a piece wage system. We objected to it because of that very variety of work and the fact that what would be proper on the job to-day, when it came in next week might be entirely improper, and we did not believe that the piecework system is advisable and advantageous in stove foundries; that it is not advisable or fair to the molders in a large majority of the jobbing and machinery foundries, although in some of those jobbing and machinery foundries we do have a piecework system, where the shop is a speciality shop and where it has part of its work a specialty. There we frequently have piecework agreeable to us.

Mr. THOMPSON. What effort, if any, was made between the union and the National Founders' Association to see if they could establish a day wage in the shops of the association?

Mr. FREY. That was our continual effort from the time that the New York agreement was entered into, in 1899, until the National Founders' Association abrogated the agreement on their own part in 1904; it was our effort, and we succeeded in establishing minimum wage rates in a large number of cities through negotiating with representatives of that association.

Mr. THOMPSON. Locally?

Mr. FREY. Locally,

Mr. THOMPSON. Did the association raise any objection to the establishment of day rates locally and not establishing them as a national wage scale all over the country?

Mr. FREY. Well, my experience was that they always objected to establishing any wage scale. They would agree to a minimum, but they always held they were opposed to the recognition of such a thing as a minimum wage rate contrary to their policy, although they would enter into an agreement establishing one.

Mr. THOMPSON. Was the effort of your association devoted solely toward the establishment of a daily wage rate for the membership of the National Founders' Association or did you differentiate and try to establish a day wage in some shops and a piecework scale in other shops?

Mr. FREY. Our efforts were always to establish a day wage.

Mr. THOMPSON. In all of their foundries?

Mr. FREY. In all of their foundries except specialty foundries that were running on a piece basis, and then we did not disturb them.

Mr. THOMPSON. Did they ever agree to meet with you, or did they ever take up seriously the question of establishing any collective price for labor, or did they insist that the price for labor should be left to each individual shop, and that they should do business solely upon the individual bargaining of the molder with a firm?

Mr. FREY. No; it was not left to the individual. Our wage scales were generally negotiated for a city, and it would be a wage rate for that city. There have been some desultory conversations about a district wage scale, but we never reached the point where we ever discussed that with any effort to arrive at one; it was merely discussed sometimes as a condition that might be desired, but nothing more.

Mr. THOMPSON. What questions were brought up between your union and the National Founders' Association in this effort to determine on a standard or local wage scale?

Mr. FREY. I do not know just exactly what the trend of that question is.

Mr. THOMPSON. Was it brought up as between floor and bench molders, and did the National Founders' Association wish to have the privilege of varying in the prices paid to day men?

Mr. FREY. Yes; the National Founders' Association desired to have several differentials, as they termed them; that is, if a minimum of \$3 a day was established they desired to have a differential between the bench and the floor, and that differential was in existence in a number of localities. They also desired to have a differential in addition to that for men that they would hold were not fully skilled mechanics. It was our object to eliminate these differentials because changing conditions in the industry made the bench molders as valuable as a mechanic, and as hard a worker as a man on the floor. We could see no difference in his value as a producer, or the amount of labor which he performed, or the skill required, and we endeavored to eliminate the differential during the years that we were dealing with the National Founders' Association; we found it impossible to eliminate these differentials, but when they severed friendly relations with us we then started out to eliminate them ourselves, and I am pleased to state that we have succeeded.

Mr. THOMPSON. What reason did they give for their opposition in that regard?

Mr. FREY. That the bench molder was not worth as much as the floor molder in their opinion.

Mr. THOMPSON. They gave no facts? Is that the only argument they used to justify the position they took?

Mr. FREY. That was the only argument; there were no facts that could be advanced.

Mr. THOMPSON. What position was taken, if you know, with reference to the privilege of varying in the wages paid to different molders, if such a position was taken?

Mr. FREY. I do not get the drift of that question either.

Mr. THOMPSON. Did the founders wish to have the privilege of paying 40 per cent of the molders 10 per cent below the standard wage?

Mr. FREY. Oh, yes; but that was not brought on prominently until within a year or so of the time that they withdrew their friendly attitude.

Mr. THOMPSON. Do you think that had any material effect on the breakdown of the agreement?

Mr. FREY. No.

Mr. THOMPSON. Was there any question up between your union and the National Founders' Association with reference to the hours of work?

Mr. FREY. Yes.

Mr. THOMPSON. What was that question, and how was it met?

Mr. FREY. It was to secure a nine-hour day prevailing generally in 1899. We made a great deal of progress in securing the shorter workday through conferences with the commissioner of the National Founders' Association prior to 1903, or rather prior to 1904.

Mr. THOMPSON. Was the attitude of your union on that question to take it up piecemeal in these different localities, and did the National Founders' Association disagree with that method and wish to establish a national scheme?

Mr. FREY. It was our desire and our policy, and we carried it into effect, to secure a nine-hour day throughout the entire district at one time, so that all employers of our members would be on an equal footing insofar as hours of labor were concerned.

Mr. THOMPSON. You mean by competitive districts?

Mr. FREY. No; throughout the United States and Canada. That was our effort, and we succeeded in establishing a nine-hour day during a period of about three years, but we were forced to take that up locally, because where the foundrymen declined to grant it after conference, it went to the officers of the National Founders' Association, we met them in conference, and adjusted it.

Mr. THOMPSON. Did they raise any objection in regard to your method of bringing it up locally, in local districts, rather than making it a national question, dealing at once with the whole country.

Mr. FREY. Generally where we requested the nine-hour day the foundryman wanted us to get it from all his competitors first, and then come to him and he would be willing to give it.

Mr. THOMPSON. Was there any question between your union and the National Founders' Association with reference to the open shop?

Mr. FREY. I do not know how to answer that question, in order to give the exact conditions that existed.

Mr. THOMPSON. Was there any objection to shop organization or union organization in shops?

Mr. FREY. It was a peculiar condition; some members of the National Founders' Association were operating shops where none but our members were employed. We were aware of that and took it as something that could not be changed. In other localities the members of the founders association were actively engaged in trying to prevent our securing any organization in their foundries, while in other foundries, members of the association, the members of our union were discriminated against, those who took an active part were discharged, and every effort was made to wipe out the degree of organization we had succeeded in securing.

Mr. THOMPSON. I understand from what Mr. Valentine has said, that the attitude of mind of the members of your organization on the question of arbitration is that they believe in the conciliation method; that is to say, by representation on any board of an equal membership of both sides, in the absence of an umpire.

Mr. FREY. Yes; we are not favorable to arbitration as it is understood today, where the third man has a deciding voice, and as long as that question has been asked I would like to give the reason why.

Mr. THOMPSON. I would like to ask one more question on this other thing, and then you may; on the question which you now stated, in reference to the open shop and discrimination against the union men, which caused friction between your union and the National Founders' Association.

Mr. FREY. Yes.

Mr. THOMPSON. If you had a system of arbitration providing for an umpire to whom that matter could have been referred and a decision brought about, would not that have helped in a solution of the question and the possible keeping of the agreement alive between the two associations?

Mr. FREY. If the so-called umpire was a man of infallible judgment, who had the power to enforce his decision, perhaps so; otherwise not.

Mr. THOMPSON. You say with reference to enforcing decisions; have you any question but what the union would have lived up to the decision so made?

Mr. FREY. I have no doubt that the union would, and I am quite confident that the founders would not in some instances, because that has been my experience.

Now, on that question of arbitration, our experience is this, that where we have a point in dispute and we meet with equal members on each side and eventually agree to something, we feel that agreement is a bargain. Each side may have given away something that they did not desire to give away in order to secure some other condition, but whatever agreement is reached as the result of a bargain, both employers and workmen would feel that a bargain which they themselves have entered into is something which they at least can carry out, whereas the findings of a third man always or generally bring about a condition where one or the other party to the arbitration is forced to do something or concede something which is distasteful; and there is that feeling, "This is not a bargain which we reached; this is something forced on me," and the result is that they merely wait for a time when they can overturn that condition which they object to, and my personal experience would lead me to look with disfavor on arbitration except as a last resort, and between men who were incompetent to sit down and deliberately talk over the questions which they had in dispute.

Mr. THOMPSON. Taking the very situation which you have named, in regard to the difficulty arising from the open-shop question—or, as it has been called, the open-shop question—where men were discriminated against or discharged because of their affiliation with your union, in questions of that character don't you believe that the introduction of a third party, an umpire working with the representatives of each side, endeavoring to bring them together on the proposition, would have assisted you in settling these difficulties without the friction which you had in the method which you have adopted?

Mr. FREY. No; I believe that it would have been of no value whatever. In fact, in one large city in Pennsylvania, one of the largest manufacturing cities in Pennsylvania, we entered into an agreement with the National Founders' Association in 1900 establishing a minimum wage rate. The mere fact that our organization had been recognized to the extent of giving it or its members a wage rate proved very distasteful to a number of the members of the National Founders' Association, and during the year between 1900 and 1901 all of the official influence of the National Founders' Association proved insufficient to force their own members, in some instances, to pay the rate of wages to which that association had agreed. So if all the official strength of the association was insufficient to make its members pay a wage rate that we had agreed to and negotiated with them, certainly no individual acting as umpire could do anything.

Mr. THOMPSON. I was referring in that question of the umpire, Mr. Frey, more to daily questions which arise in the shop, including that question of discrimination, questions of discipline, and other matters of more or less an individual character between an individual workingman and the firm by which he is employed. I can very easily see that an attempt to force on the stove manufacturers, or even one member, a minimum wage, in which he does not believe from a business standpoint, would be resisted; and on such fundamental questions and matters of policy I think all would agree you can not force those questions over by the decision of a third man. But in regard to these daily matters that come up in the shop and relate to the individual, such as the very one you named, discrimination against the union man, do you still think the introduction of the umpire in that field, who would act, say, first as a conciliator to bring both the parties together, they each recognizing that he has no power to decide the thing if they do not agree thereto, and from that very fact having an influence on both of them to get them together, would not be an efficient piece of machinery in your trade and in the very matter you have mentioned?

Mr. FREY. I do not think it would be of value to any trade. We have a law in a number of States making blacklisting criminal. The courts of those States have held the law constitutional, but they can not reach the man who is doing the blacklisting. You can not get after him. They do not let you know they are blacklisting, they do it in such a clever way. It would take a very astute lawyer to discover there was even a trail to start to follow to the head, and when it comes to discriminating against the union man in a shop, there are a thousand and one excuses. The foreman and the employer would assure you "I would not discharge that man for anything in the world; I have not discharged him; I have only laid him off because work is slack in his line." They used to do that, and tell them boldly "It is because you are too active in the union"; but as time passed they got wiser and found excuses that sounded better. A third man would not help in that thing.

Mr. THOMPSON. If I should tell you that in a business—not the molder's business, but one in which there is an agreement between the employees and the firm, providing pay for what I may call the ordinary open-shop proposition, or, as it is called to-day, the preferential shop; that under that probably 400 or 500 cases of discrimination have come up, most of them cases perhaps that might have caused strikes and disturbances, at least in local shops, and that those questions of discrimination were settled by a board of arbitration, and that the board of arbitration consisted of three members, you still would not think that would be a wise piece of machinery for that purpose?

Mr. FREY. Not unless that piece of machinery had been working long enough to indicate its ability to do this work year after year.

Mr. THOMPSON. Would three years be a sufficient length of time?

Mr. FREY. No. I would want to know all the circumstances. I presume you refer to the protocol in New York?

Mr. THOMPSON. No; I am referring to the agreement in Chicago. The protocol in New York was arranged on the basis you mention, of an equal division of employers and employees, and it is my opinion, after investigating that situation, that the near breakdown was caused by the lack of an umpire to decide just such questions, trivial in offense as to the whole organization, but important as to the individual; and I believe by the introduction of a third man, the umpire proposition, the New York protocol will be saved and the agreement will grow.

But that is going outside of your trade, and I will not go into it.

Is there anything you would like to add to what has been said on the machine proposition, and on the question of the limitation of output of the materials, Mr. Frey? Would you like to add anything to that which has already been stated by the other witnesses?

Mr. FREY. I do not think I could add anything to it. The policy of the molders' union is not opposed to the introduction of machinery. It has not been for many years. The question does not arise over the introduction of the machine, but as to whether the machine will be operated under conditions where our union will have a chance to negotiate for the wages to be paid to the men that operate it. There is a good deal of prejudice on the part of some of our men against the molding machine. The prejudice arose originally for probably the same reason that workmen have always objected to the introduction of a machine. They saw in it a menace, as they thought.

The particular opposition which the molders have had against the molding machine—and that is an important feature—is the fact that it was adopted, or rather it was taken up, by many members of the National Founders' Association as an instrument to disrupt the molders' union.

The molding-machine manufacturers advertised the fact that "you do not need strikes if your plant is operated by molding machines," and the National Founders' Association, from the time that Mr. Briggs became commissioner and while he was president, devoted considerable time to advising their members to introduce the machine, because it weakened the strength of our union. Their official publication, the Review, contained many articles which were written with the object of convincing foundry men and molders that with the introduction of the molding machine the neck of the National Molders' Union was being wrung. Under those circumstances it is not surprising that many of our members acquired a very bitter prejudice against the molding machine. Nevertheless it has been our constant policy to raise no objection to the introduction of the molding machine.

A number of members of the National Founders' Association, who do not have that bitter feeling toward our organization, which is the official attitude of that organization, have had agreements with us for five or six years covering the operation of the molding machines in their plants. Their plants are very extensive, and the two which I have in mind are among the largest in the United States or Canada.

We have no trouble over the operation of these molding machines. We have no trouble in securing the price on them, but we have never received any intimation from those two large corporations that our attitude was any more unsatisfactory to them than our attitude toward any other wage question.

Mr. THOMPSON. If you are willing to state, Mr. Frey, will you tell the commission the nature of the agreements you have in Canada with reference to the use of the molding machines?

Mr. FREY. Where?

Mr. THOMPSON. In Canada. I understood you to say you had an agreement in Canada.

Mr. FREY. No; I said these corporations were as large as any in the United States or Canada. The two firms that I had in mind are in the United States. I do not care to mention their names.

Mr. THOMPSON. Would you object to stating the general nature of the agreements with those firms in reference to the use of the machine?

Mr. FREY. The agreement is that the firm will take up the pricing of the work which is made on those machines with the committee which we have in effect, and that in case they fail to reach a price President Valentine or one of his deputies will go there and fix a price. That is the only agreement we have—the same as any other agreement covering day men.

Mr. THOMPSON. Would you have any objection to furnishing this commission a copy of those contracts, leaving out the names of the firms?

Mr. FREY. I have not authority over the documents of the International Molders' Union. I would not want to make that promise. Perhaps our executive board or Mr. Valentine will take that matter up.

Mr. THOMPSON. I recognize you may not want to furnish the names of the firms, and I suggest that you may leave those names out.

Mr. FREY. If our executive board is agreeable, I certainly have no objection.

Mr. THOMPSON. As I understood the testimony of yesterday, Mr. Frey, Mr. Briggs stated that the breakdown of the agreement between your union and his association centered principally on the question of apprenticeship and the use of the machines. Mr. Valentine, in his testimony, centered it principally on the unity price. What have you to say with reference to the causes which led to the breakdown of the agreement?

Mr. FREY. It may take a few moments to cover this ground, but I feel this is the only thing of value to that; that is, of vital value that can be brought out so far as these three associations are concerned. I would like to take a few moments to cover the ground. I will be as brief as possible.

Mr. THOMPSON. You may proceed, Mr. Frey.

Mr. FREY. You have heard the policy of our organization explained by President Valentine and by Mr. Hogan, secretary of the Stove Defenders' Association, as to our relations. I can only add that that was our policy toward the National Founders' Association. We had an earnest desire to secure a peaceful method of adjusting our disputes in the jobbing and machinery foundries. We welcomed the New York agreement—that is, the so-called New York agreement. We endeavored to work under that agreement.

The period from 1899 to the fall of 1903 was an exceptionally good one, so far as the foundry business was concerned. Our members were endeavoring to secure higher wages. It was the policy of the international union, however, to endeavor to equalize wages and bring up the low-paid districts, so that the competition between those and the foundry centers would be less keen. The commissioner of the National Founders' Association at that time, Mr. John A. Fenton, who was commissioner from the beginning until December, 1903, took up most of those wage scales with us. In many instances we agreed to much lower wage scales than we were confident we could secure if we simply broke off negotiations and struck, because trade conditions were favorable to us.

Our members protested vigorously during this period and accused the national officers of being lax in their duties, and not as energetic as they should be to assist them in getting higher wages. We believed, however, that it was to the advantage of our own organization, in the beginning of its relations with the National Founders' Association, to go easily along, hoping to accomplish a similar condition to that which existed in the stove industry; that is, a gradual equalizing of wages and the making of it possible to take up wage scales by districts in the future. So we did not take advantage of the good times to press our claims as vigorously as we otherwise would.

During this period—that is, from 1899 to 1903—membership in our organization grew rather rapidly, and the membership of the National Founders' Association grew rather rapidly. With the increased growth in the National Founders' Association, we imagined that we saw a growing hostility to the idea of recognizing our union to the extent of entering into agreements with it. We felt that a change of policy might possibly come about so far as the National Founders' Association was concerned, and so it did, with the advent of Mr. Briggs.

The policy of the association changed, and I presume Mr. Briggs carried out that policy as best he could. I might add that trade began to fall off in the fall of 1903, and that it looked as though business would not be as good for some

little time. We have thought, perhaps without any justification whatever, that the falling off in trade was an inducement to the National Founders' Association to endeavor to establish its policy at the time that it did.

We found that the National Founders' Association were suspicious of us; that they doubted our sincerity; and found it necessary to build up a machinery that I desire to refer to in a moment. The actual break, so to speak, in the New York agreement, came with what is known as the Utica strike. The foundrymen of that city, who claimed they acted under the advice of Commissioner Briggs, enforced a reduction of wages. They said if we objected to the reduction in wages we should call for a conference. We held that if the conditions were to be changed first and then the question taken up later, that method could not bring about satisfactory results. We held that the New York agreement had only been interpreted one way during the years that it had been in existence, and that was that when a question arose over which there was a dispute, the status quo would be maintained until the question was settled or we agreed to disagree.

The question came up later, and in the fall of that year a conference was held in Cincinnati that settled the question as to the interpretation. I might say that our opinion as to the interpretation to be placed upon the New York agreement arose not only from our experience but from the official statements of its first president, Mr. Letchworth, and I would like to quote from a letter that he wrote on April 4, 1900, as follows:

"As I understand the New York agreement, it is that in case of any difference between employees and their employers the men shall not strike nor the employers lock them out until there has been an arbitration; that either party, in case of dissatisfaction, has the right to ask for an arbitration, but that pending such arbitration there shall practically be no change in the existing condition in the foundry."

"Arbitration" here being used in the original sense in which we used that word.

Commissioner WEINSTOCK. Conciliation?

Mr. FREY. Yes. Mr. Briggs contended, however, that his association or his members were justified in enforcing this reduction in wages in Utica. On October 13, 1904, a conference was held in Cincinnati to decide what the interpretation of the New York agreement should be.

That conference was composed of Mr. Fox, or rather a Mr. Letchworth, of Buffalo, who was one of the parties to the signing of the original agreement; Mr. Charles L. Newcomb, of Holyoke, Mass.; and Mr. Briggs and myself.

The moulders were represented by Mr. Fox, who was then president of our organization, or had recently resigned and was still able to act somewhat, who had been a party to the original agreement, our first vice president, myself. That conference passed the following resolution:

"Resolved, That it is the sense of this joint committee that the following is the proper interpretation of the New York agreement:

"If any change, whether of wage rate, shop practice or conditions, or any other change affecting the relations or the interests of the members of the parties to the New York agreement, is proposed by one of the parties thereto, to which objection or protest is raised by the other party, it is understood and agreed that the status then existing; that is, the status immediately preceding the proposed change, shall not be disturbed by either party pending reference and decision, as provided in the New York agreement."

That is signed by Mr. Fox and Mr. Letchworth. It was not, however, the New York agreement, or our claim that the New York agreement was violated, which in my opinion led to our inability to continue our relations with the National Founders' Association. It was, instead, their antagonistic policy to the question of our maintaining an organization, with the system they built up to prevent our organization from maintaining itself. They organized a rather extensive machinery for dealing with us. They had, first of all, a system of espionage—we termed it their "spy system"—and through that they maintained traitors in each one of our local unions to inform them as to what was going on, but we sometimes suspected from the violent language of some of these men that they were also endeavoring to stir up trouble at the wrong time for ourselves.

They also built up a corps of professional strike breakers. Mr. Briggs termed them instructors the other day. I have the contract made with one of those "instructors," which I would like to read and have it made a part of the record. This was signed October 22, 1904, by Mr. Briggs and a certain foundryman, and it reads as follows:

FREY EXHIBIT No. 1.

NATIONAL FOUNDERS' ASSOCIATION—MOLDERS' CONTRACT.

CARL GRANBUND, *Cincinnati, Ohio.*

DEAR SIR: The National Founders' Association hereby agrees to employ you for the term of one year from this date at the trade of molding or coremaking. You are to work faithfully and for the best interests of the association in all particulars; you are to work in such shops as the association designates, and when transferred from one shop to another the association will pay the railroad fare and you will not lose the time consumed in travel. You are to be at all times ready to move from place to place as the association directs, and when working in a struck shop you are to be particularly careful to work for the interests of the shop where the strike is in force.

Either the president or commissioner of this association shall be the judge as to whether or not you have been or are faithful, conscientious, and living up to the terms of this agreement.

We will pay you nine hundred and sixty dollars (\$960) per year in equal monthly installments of eighty dollars (\$80).

At the close of the year, if in the opinion of either the president or commissioner of this association you have performed faithful and conscientious work as herein stated, we will then pay you the further sum of ninety dollars (\$90) as a bonus for the year's faithful work.

It is understood that to receive the full amount of ten hundred and fifty dollars (\$1,050), you are to work full time for every working day of the year and that time lost by sickness or otherwise will be deducted.

Sickness alone will be the only excuse for your failure to carry out the terms of this agreement.

NATIONAL FOUNDERS' ASSOCIATION,
O. P. BRIGGS, *Commissioner.*

Dated October 22, 1904.

I fully understand the conditions of the above offer and hereby accept same and agree to work for the National Founders' Association and in its interests to the very best of my ability, and if at any time I fail to carry out my part of the agreement, as decided by the president or commissioner, who shall be the sole judge as to whether or not I have been or am faithful and conscientious in living up to the terms of this agreement, I hereby agree to the cancellation of this contract and waive all claims for wages or salary after the cancellation and also any claim to the whole or any part of the bonus to be paid at the end of the year.

CARL GRANBUND.

In the presence of—
P. T. GOULD.

It is signed with a little statement below, you will see, that the man has read it and understands what it means.

We felt that the building up of this system of local informers and the gathering together of a continually growing army of professional strikebreakers under contract by the association was an evidence, at least, that if they still maintained friendly relations toward us, it was to be prepared for war, and our impressions were rather strengthened when we read the reports of the officers of the association relative to these two features. For instance, with reference to the professional strike breakers, in the report for 1905 the following statement is made:

"The contract with molders by the year for the purpose of having on hand at all times men in our employ was undertaken about 18 months since. At the outset it was an experiment, as you all know. I can assure you that the experiment has been very successful. We have encountered such difficulties at the beginning as are usual to all new methods, but to-day we have a force of men the equal of any body of molders you can select. We have treated these men right, for which they are duly appreciative. The contract we enter into is becoming more popular every day and the applications for it are so numerous that we have now a large waiting list on hand."

About this time the association was also endeavoring to build up an organization of foremen, with the object of using this foremen's organization as an anti-union machine, and in the same report to the convention of the National Founders' Association this statement is made. I believe this is President Briggs's

report. If it is not, it is the report of their secretary. It is the official proceedings, anyway. I read from page 12, as follows:

"I have had brought before me most emphatically in our work of the past year the unquestioned value of associations composed of foundry foremen. In nearly every strike where the association has been called upon to assist its members the foreman has played a most essential and important part. I believe you will, therefore, recognize at a glance the importance of the proper training of this branch of our industry. The experience of your officers and field force has clearly demonstrated that the foremen of our shops are in a large measure responsible for the success of the shop, as in reference to its productive capacity, and, secondly, its peaceful and harmonious conduct. The associating together of the foundry foremen of any city will result in securing these essentials.

"My recommendation to this convention is that the incoming administrative council be instructed to use every possible effort to establish in each city where the association has any membership, strong foremen's clubs or associations, organized upon the plan of that which is now accomplishing so much in the interest of the foundrymen of Erie, Pa."

I am bringing this matter out to show the reason why it was impossible for us to get along peacefully. This association of foundry foremen was a matter of reference at various meetings of the National Founders' Association, and the claim is, I believe, sworn statements were made in the official publications of the Foundrymen's Review in reference to this. On page 181 there is a quotation from the report of Mr. Pessano, the president of the National Founders' Association, which reads as follows:

"I have had brought before me most emphatically in our work of the past year the unquestioned value of associations composed of foundry foremen. In nearly every strike where the association has been called upon to assist its members the foreman has played a most essential and important part."

Mr. THOMPSON. What is the date of that report?

Mr. FREY. This report is at page 181 of the Iron Moulders' Journal. That is, I reproduced it, and I am using this because I did not bring all the Reviews with me. There is no question as to its accuracy.

Mr. THOMPSON. What is the date of it, is what I asked?

Mr. FREY. I am reading from page 181 of the issue of 1902. I continue reading, as follows:

"I believe you will therefore recognize at a glance the importance of the proper training of this branch of our industry. The experience of your officers and field force has clearly demonstrated that the foremen of our shops are in a large measure responsible for the success of the shop, as in reference to its productive capacity and, secondly, its peaceful and harmonious conduct. The associating together of the foundry foremen of any city will result in securing these essentials."

The article then goes on to recommend that this should be done, and Mr. Durban, who was a very active member of the association, follows with this address, and I do not care to read it all, but the commission can have it if they want to use it. I should just like to quote a few sentences from the address, as it will indicate to you that this foundry foremen's organization was in use. I am reading it just to bring out this point. I read as follows:

"The proprietors did not attend the meetings, and had nothing to do with them, and did not even request their men to attend the meetings, but they met about twice a week at first and took up the matters of the troubles in the shops. Each man"—

That is, each foreman—

"reported a particularly offensive union man, those fellows that seemed to be coaching the thing and seemed to be keeping up the excitement and seemed to be the head centers, and the result was those men were let go, they were dismissed from time to time. And the foundry foremen had conceived the idea that they would not hire a man in any of the foundries unless he had a recommendation."

So that in foundry terminology when the foundry foremen's association tied the can to a union molder he did not have another chance to get another job in that territory.

I read further, as follows:

"Of course there was a great deal of a cry about that, as being a black list, and I suppose it was something of that nature."

Commissioner WEINSTOCK. Do you say that?

Mr. FREY. No; I am quoting. I read further:

"Of course there was a great deal of a cry about that, as being a black list, and I suppose it was something of that nature, but at the same time, if a man is going to employ any one in his office, he wants some sort of recommendation. And when it became known that a man was particularly offensive and making trouble in the shops, it sort of tamed him."

Now, going down a few paragraphs further, I read again:

"Of course we are very strongly in favor of these organizations of foremen as an assistance to the National Founders' Association, and I believe that the organization of the foundry foremen in Erie has saved the National Founders' Association ten or fifteen thousand dollars."

Then further references are made, and I read further as follows:

"For instance, on days' work, if a man was putting in a fair day's work, some of those members would go over and say: 'You are doing so much, don't do so much.' If a fellow was caught at that by his foreman he was promptly dismissed.

"The result has been gratifying in another way. Erie has sent out a great many men to other struck shops."

In other words, the foundry foremen's association was used to disrupt our shops, wherever men were sent out to use these tactics, and they were also used as strike breakers whenever shipments of strike breakers were desired in other localities.

Now, the principle of the New York agreement was that whenever a dispute arose that could not be taken up locally and that could not be settled locally, it would be taken up by the representatives of the two associations; but about the time that Mr. Briggs became commissioner the policy was changed. First of all the National Founders' Association, without consultation or conference with the International Molders' Union, adopted an interpretation of this New York agreement and gave it to their members. In other words, they took the responsibility of altering the meaning of that agreement to some extent without consultation with us. Then it was determined that their members should not sign any more agreements with the International Molders' Union unless those agreements were of the form which the National Founders' Association desired. In other words, they endeavored to force upon us the so-called outline of policy. They instructed their members not to sign any more agreements with us unless we would sign the peculiar and particular form of agreement that they had adopted, and in an article in their official publication, the Review, dated June, 1904, the following statement is made, and it indicates what, to our mind, is the arbitrary and unyielding attitude of the National Founders' Association.

Mr. THOMPSON. What was that date, June, 1904?

Mr. FREY. June, 1904. This reads as follows:

"The membership of the National Founders' Association has proven itself 'true blue' thus far in its treatment of agreements with molders.

"Prior to the holding of the national conference in April members of the association whose agreements with the molders were about to expire or had expired, were requested to await action of this conference before executing new contracts.

"In adhering to this plan our members have exhibited a loyalty which can not be too highly commended.

"After the adjournment of this national conference and the failure to secure a uniform agreement the decision was reached by the officers of the association to adopt as a definite policy the equitable principles which should obtain in the foundry of every member of the association and in furtherance of this plan all members are now giving or have given notice of an unwillingness to continue the local agreements of last year. In no case, as far as we are aware, has one of these agreements been renewed."

Mr. THOMPSON. What was that national agreement you have referred to there?

Mr. FREY. What the National Founders' Association endeavored to have us have for a form of agreement was not the result of any conference we had with them, but I presume their executive council met with our executive board and drew up the form of agreement that they wanted, and after this had been drafted, probably after consulting with their attorneys, they advised their members not to renew any of the existing agreements that they had then, but to tell us "Either you sign this form of agreement which we have drawn up, or there will be no more agreements."

Mr. THOMPSON. I would like to look at that paper.

Mr. FREY. I had not got through with it—some of it.

Mr. THOMPSON. I will pass it back [after examining paper]. Thank you.

Mr. FREY. I am reading rather extensively, perhaps, but it brings me to the nub of the reasons why friendly relations were severed, not on our part, but they refused to deal with us any further; they wanted no more agreements with us that did not give them all they wanted. I am quoting now.

"And here lies the key to the whole situation. The system of local agreements with molders is really of comparatively recent origin.

"Before the year 1899, in which the New York agreement was made, local agreements were almost unknown. In that year a few were signed. As the boom of prosperity gathered velocity and weight the union seized the opportunity to compel additional recognition. Many foundrymen actually vied with each other to be first in granting this recognition, and the system of local agreements became 'crowned with the cross of gold.'

"Once established, but little remained to be done by the national officers of the molders' union to afford added zest to local proteges in efforts to hold the vantage point. With each revolution, like a snowball, the movement gathered in volume.

"The National Founders' Association, then only in a formative state, was called upon to meet the accrued benefits of a labor organization already in the thirty-first year of its existence.

"The members of this union were mostly possessed of the spirit of Anglo-Saxon enterprise, and for over a quarter of a century had not been met by any obstruction in their path of perfecting their complete and unsurpassed organization."

We thank you for the compliment.

"Little wonder is it that when the National Founders' Association appeared on the scene, with officers and members in a new rôle, and commercial affairs in a plethoric state, it was hardly possible to promptly check the course of this practice.

"There were many foundrymen at that time who possessed a firm belief in the efficacy of local governments. Others were forced to sign them. All are now the wiser for the experience and united in opinion. Simultaneously all seem to have reached the conclusion that the present is the opportune time to curb the onslaught."

That was our desire, to secure more agreements.

"No one is entering into these contracts now, but for the future the way must be cleared.

"During the present period of temporary depression let us not neglect the opportunity to study the possibilities of a revival of business and increased requirements of our customers.

"In times of peace prepare for war."

"Let this sound the warning to members of the National Founders' Association not to sleep on their rights, but to stand firmly at the helm that the officers of their association may have the fullest measure of support in their determination not to permit the rejuvenation of this system of local agreements once it is removed from the catalogue of things extant."

I wanted to bring out the fact that the reason we are not enjoying friendly relations with the National Founders' Association since 1904 is not because of our unwillingness to meet them in conference and adjust questions as we formerly did, but because of their unwillingness to have any official or friendly relations with us. I want to bring that point out, because the impression has been created from much of their official literature during recent years that it was the molders who were to blame for the severing of these friendly relations.

As a matter of fact, they were continually advising their members not to have any relations with us, and under no circumstances to settle with us during a strike or even to discuss any proposition with us toward settling a strike, and in connection with that I would like to read a circular issued by the National Founders' Association.

Commissioner WEINSTOCK. What is the date?

Mr. FREY. August 2, 1906. I will turn it in as an exhibit.

"WARNING.

"NATIONAL FOUNDERS' ASSOCIATION,
"Detroit, Mich., August 2, 1906.

"To the foundrymen of the United States and Canada.

"GENTLEMEN: We have just been made acquainted with several attempts of officials of the molders' union to secure the consent of the proprietors of

foundries which have lately been struck, and where the union is paying strike benefits, to permit the striking molders and coremakers to return to work under almost any conditions, the only proviso being that negotiations of this character should be entered into with one of these officials.

"We desire to warn the proprietors of these struck foundries, if they ever expect to conduct their plants free from union domination, it will be much more to their interest if they dismiss from their minds once for all any thought of doing business with these walking delegates of the molders' union.

"It is to be presumed that every foundry proprietor now engaged in combating a strike has measured the cost in a manner befitting the successful conduct of any enterprise, and once the old employees have struck the plant it is absolutely useless to think of negotiating with them through the medium of their representatives.

"Each time interviews of this nature are granted the struggle is prolonged and thousands of dollars added to the cost, not only for the proprietor granting the interview but for his fellow foundrymen as well, for an interview granted in Nova Scotia may be used by these union emissaries with no inconsiderable effect to brace up a lost cause on the Pacific coast or Gulf of Mexico.

"UNION MUST CUT EXPENSES.

"The efforts now being made by the molders' union to get its men back to work are dictated by the condition of its treasury and the manifest necessity of reducing expenses. Each striker who is given employment in this way reduces the expenses to the union by \$7 per week."

Evidently they desired to keep us out on strike so as to use up all of our money.

"Furthermore, so long as these negotiations are conducted through the channel of the walking delegate and the strikers permitted to return to work as union men the foundrymen may expect to see their plants unionized again within a very short space of time, and the expense of the present strike, so far as the proprietor is concerned, will be entirely wasted.

"There seems to be in some sections an inherent desire on the part of foundrymen to meet and 'discuss the situation' with these union agitators, one foundryman even going so far as to remark, 'So-and-so sent for me and I went down to the hotel.' A more silly and abject compliance with the dictates of a labor agitator can hardly be imagined, yet this foundryman at one time expected to conduct an 'open shop.' Unfortunately for him, his trip 'down to the hotel' resulted in the union gaining control of his plant, machines, apprentices, limitation of output, and everything else.

"Very truly, yours,

"F. W. HUTCHINGS, *Secretary.*"

So that the National Founders' Association, as far as we were able to discover, do not believe in agreements with the molders' union; did not believe in conferences to adjust our disputes locally, but it believes in establishing a spy system and a corps of professional strike breakers and the use of private detectives employed through some of the notorious agencies to make our union lose, first of all, by adopting the so-called Erie plan of running every active union man out of business and by having informers in the local union, and even in our office, so that they would keep informed of everything that was going on. So far as we could see—we may be mistaken in this, but so far as our observations went, so far as we could gather from the official statements of the officials of the National Founders' Association—it was not the agreement that they desired or were then organized to secure, but rather the extermination of the National Molders' Union. That is one of the reasons why I believed we failed to make the New York agreement a measure for the peaceful adjustment of differences that arose in the jobbing and machinery foundries.

Mr. THOMPSON. To what do you ascribe that attitude of the National Founders' Association?

Mr. FREY. The spirit that had developed among some of the employers was almost like a contagion—like the I. W. W.—and caused like contagion among some workmen, but the idea seemed to gain ground to have nothing to do with unions. "If you give them recognition they will grow stronger, and they will run your business, and you will not have your own way," and as my friend, Briggs, stated, "Cut the union off behind the ears."

To show their policy, I would like to read just one more circular into the record. This is signed by Mr. Briggs. This is as showing their attitude as opposed to conferences or agreements.

Mr. BRIGGS. Will you kindly read the date?

Mr. FREY. It is impossible for me to read the date. I published it in the November issue of our 1905 journal, and I think you issued this in October. You will recall I had some editorial controversy over the philosophy of the circular. It is called "Still drifting" and is as follows:

"I wish to call your attention to the tactics at present being pursued by the molders' union in its treatment of certain districts:

"At a meeting of the officials of that organization lately certain requests from various local unions for support were presented, these to become effective in case the molders found it necessary to strike to compel compliance with their terms. These requests, more commonly designated as 'grievances,' were sorted out and the decision reached to pay more particular attention to what these officials called 'low-rate districts' when granting strike support."

Showing that we were continuing our policy after they had broken off negotiations with us, continuing in our effort to raise wages in the lower districts, rather than pay attention to where they were higher; in other words, to hold the higher rate man down in our effort to bring the lower rate man up.

"The intention in this is to pursue a well-outlined plan of campaign in the way of forcing those manufacturers who now have reasonable conditions in their plants, so far as union rules are concerned, to recognize and establish in their foundries the same union regulations regarding apprentices, machines, output, rates of pay, hours, etc., as obtain in strong union shops.

"If they get this pile of wood split and all shops upon their uniform basis, and the 9-hour day where the 10-hour is now the rule, these officials have in mind the 8-hour goal and uniform minimum wages.

"I know you will say this is quite a job, and I think so, too, but that don't make any difference to that outfit, for the simple reason that they must be kept busy.

"My purpose in writing is merely to put you and your neighbor on your guard, that you may be considering how to deal with this thing when it comes up. In my judgment, the best plan to adopt is to keep your capable and fair-minded men well paid and satisfied, but don't increase any minimum wage rate. Many of these requests have already been refused, and the only way to prevent successful outcome of the plan of this union is to chop it off behind the ears before it gets time to grow."

Commissioner WEINSTOCK. Who wrote that?

Mr. FREY. Mr. Briggs. Now, I do not care to read any more documents to prove the attitude of the National Founders' Association unless you care to hear them, but I could give you a trunk full similar in character, tone, and purpose.

Mr. THOMPSON. You have no further explanation of the reason that the National Founders' Association took that attitude than you have already stated?

Mr. FREY. No. I believe it was the disinclination of a majority of the members of that association toward collective bargaining with the members of the union.

Mr. THOMPSON. How do you account for the attitude of the majority of the membership of that association as compared with the attitude of the stove makers' association?

Mr. FREY. Well, the only way I can account for it is this, that the members of the Stove Founders' Defense Association had had relations with us ever since the industry began. First of all it was Kilkenny cat relations for a period of 25 or 30 years, but it was none the less relations. After this Kilkenny cat period we then entered into a conference agreement, and then, instead of fighting each other the old way, we fought each other with facts and arguments. There have been no organizations of this kind among the jobbing and machinery foundrymen.

Mr. THOMPSON. In that case it was a case of callow youth and inexperience?

Mr. FREY. Yes; callow youth. The best proof of its being callow youth, so far as its policy is concerned, is in the fact that a large number of their members to-day have agreements with our union that are operating union foundries, and we have no trouble whatever with them. We meet them as cordially as we meet the members of the Stove Founders' National Defense Association; in fact, a number of them withdrew from the National Founders' Association so that with good grace they could renew former relations with our organization.

Mr. THOMPSON. What percentage of the workers employed in the foundries of the National Founders' Association are members of your organization, if you know and if you care to say?

Mr. FREY. I do not know who are the members of the National Founders' Association. We have had no official dealings with them for a number of years. We are only interested in past history, so far as they are concerned.

Mr. THOMPSON. When did the first evidence come to you of the employment of spies in your ranks by the National Founders' Association?

Mr. FREY. From 1900 we knew there were a few in connection with a local strike, but the systematizing of the matter we knew nothing of until Mr. Briggs assumed the helm.

Mr. THOMPSON. When was that?

Mr. FREY. In the latter part of December, 1903, or the first part of January, 1904.

Mr. VALENTINE. 1903.

Mr. FREY. December, 1903, was it not?

Mr. VALENTINE. Yes.

Mr. THOMPSON. At that time did the members of the National Founders' Association have trouble with your union in various localities?

Mr. FREY. Yes; there had been strikes. Where a conference failed to secure an adjustment of the matter, a strike would result; but we had had very few strikes comparatively during the period from 1899 to December, 1903, compared to what followed when the new policy of the association was established. Then it was warfare, because they discharged our members and we retaliated, and we went back to the Kilkenny cat situation.

Commissioner WEINSTOCK. It was war to the knife?

Mr. FREY. It was, and that is the reason we are still alive.

Mr. THOMPSON. Was there a strained relation between the association and your union, although your contract was still in existence?

Mr. FREY. Yes. We recognized the different atmosphere immediately after the first of January, 1904.

Mr. THOMPSON. Then, as a matter of fact, while the contract was still in existence at that time, a state bordering on war existed between the two organizations?

Mr. FREY. Yes; because the members of the foundrymen's association refused to enter into any more agreements with us, and the conferences that we held failed in reaching any agreement. The members carried out the instructions as indicated in the report I just read.

Mr. THOMPSON. If that is so, what objection, if any, does your union have to the engagement of the contract men or molders, about which you have read, that were employed by the National Founders' Association?

Mr. FREY. I presume about the same objection as an American revolutionist had about the Hessians coming over here. I do not think there is much difference. It is about the same thing—and about as much respect for them, too.

Mr. THOMPSON. In regard to the question of spies, what evidence, if any, and if you care to state it, have you obtained?

Mr. FREY. Some of the men who were employed in that capacity, while not having the grace to go and hang themselves after taking the 30 pieces of silver, did have the grace to come and tell us all about it, and also give to us a list of names of some of the others, and we tried now and then to weed out some of those men that we were sure were spies.

Mr. THOMPSON. In your opinion, Mr. Frey, does the existence of the union help the worker, and does the use of a collective agreement by the union help him also?

Mr. FREY. May I introduce a further statement here?

Mr. THOMPSON. Yes.

Mr. FREY. A statement was made by Mr. Briggs yesterday as to the reason of our quarrels, that it was not a matter of wages, but our desire to secure other conditions. Those statements were made, and as a result President Valentine submitted a statement as to the issue in 1906 to the editor of the Iron Trade Review, and it was published. I do not need to give the details, but it gives what we consider to be the issue. May I have this incorporated in the record?

Mr. THOMPSON. Yes.

(The statement submitted and referred to by Mr. Frey is as follows:)

THE ISSUE—As Stated by President Joseph F. Valentine.

[A review of the present relations of the Iron Molders' Union of North America and the National Founders' Association. Written at the request of the Iron Trade Review.]

EDITOR IRON TRADE REVIEW:

In response to the very kind invitation contained in your letter of the 9th instant, I herewith give, as briefly as I can, a statement of the present differ-

ences between the Iron Molders' Union of North America and the National Founders' Association, and the causes which, in my opinion, led up to them. Those who have been readers of the Iron Trade Review have been made familiar with what was known as the New York agreement. It was nothing more than a broad recital of the fact that the members of the National Founders' Association, on the one hand, and the iron molders' union, on the other, subscribed to the policy of conciliatory methods when disputes arose between them, and provided such machinery as the contracting parties deemed best suited to give this policy effect.

Let it be known, in passing, that the iron molders' union for the past 15 years has consistently advocated the conciliatory policy. It has succeeded in educating its members to recognize the good to be derived from sitting down with their employers in friendly council, to discuss all subjects of mutual interest and to thrash out and effect a settlement of all matters which threaten serious differences. It has recognized the fact that, amid the startling industrial changes of the past quarter of a century, new problems have arisen that can not all be solved by the rules which previously did good service. Problems they are which must be fearlessly and yet fairly discussed with their employers. It believed, too, that just as these problems are difficult of satisfactory solution by the molders, it is equally difficult for the foundrymen, with due regard for the interests of the molder, to suggest the answer. But, amid all this confusion of thought, amid all the conflict of selfish interests on both sides, it has held firmly to its faith in the ultimate triumph of heart-to-heart discussion by the interested parties. And it has held firmly to the belief, too, that until final solution is reached, conflicting interests should patiently strive, by prescribing for each specific case of difference as it arose, to avoid conflict which can but postpone solution and destroy the harmony and good will which would promote it.

THE NEW YORK AGREEMENT.
